ROYAL COMMISSION ON INDIAN CURRENCY AND FINANCE.

LIST OF WITNESSES EXAMINED.

Date.	Name.	Pages of Evidence.
November 24th, 25th, 26th, 1925.	The Hon. Sir BASIL P. BLACKETT, K.C.B., Finance Member of the Governor General's Executive Council.	3–49
November 26th, 1925	The Hon. Mr. A. C. MCWATTERS, C.I.E., I.C.S., Secretary to the Government of India, Finance Department.	50–67
November 27th, 30th, 1925.	Mr. H. DENNING, I.C.S., Controller of the Currency	68–99
December 1st, 1925 ...	Lieut.-Col. G. H. WILLIS, C.I.E., M.V.O., Senior Mint Master and Master, Security Printing, India.	100–109
December 2nd, 1925...	Dr. PRAPHULLACHANDRA BASU, Vice-Principal, Holkar College, Indore ...	110–122
December 2nd, 1925...	Mr. H. L. CHABLANI, Head of the Department of Economics, University of Delhi.	122–135
December 3rd, 1925...	Mr. B. G. BHATNAGAR, University of Allahabad	136–145
December 4th, 1925...	Mr. GYAN CHAND, M.A., Professor of Economics, Benares Hindu University	145–162
December 7th, 1925...	Messrs. V. A GRANTHAM and H. A. W. BRENT, representing the Chamber of Commerce, Bombay.	162–177
December 8th, 1925...	Mr. B. F. MADON, Bombay	177–204
December 9th, 1925...	Mr. C. N. VAKIL, Professor in the School of Economics and Sociology, University of Bombay.	204–220
December 9th, 1925...	Messrs. P. A. WADIA and G. N. JOSHI, Professors of Economics, Wilson College, Bombay.	221–231
December 10th, 1925	Messrs. B. F. MADON and LALJI NARANJI, representing the Indian Merchants' Chamber, Bombay.	232–246
December 10th, 1925	Messrs. KIKABHAI PREMCHAND and MANECKLAL PREMCHAND, Partners, Messrs. Premchand, Roychand & Sons, Bullion, Exchange and Finance Brokers, Bombay.	246–253
December 11th, 1925	Mr. PHIROZESHAH M. DALAL, of Messrs. Merwanjee & Sons, Exchange, Finance and Bullion Brokers, Bombay.	253–266
December 11th, 1925	Sir VICTOR SASSOON, representing the Millowners' Association, Bombay ...	266–274
December 14th, 1925	Dr. BALKRISHNA, Principal, Rajaram College, Kolhapur	274–286
December 14th, 1925	Mr. J. A. WADIA, of Bombay	286–297
December 15th, 1925	Mr. GORDHANDAS PATEL, representing the Millowners' Association Ahmedabad.	297–313
December 15th, 1925	Dr. B. R. AMBEDKAR, Bar-at-law, Bombay	313–322
December 16th, 1925	Messrs. SHIVPRATAP JOSHI, RAMCHANDRA BAID, and UMASHANKER DIKSHIT, representing the Marwari Chamber of Commerce, Bombay.	323–332
December 16th, 1925	Mr. CHUNILAL MEHTA, Stock and Bullion Broker, Bombay	332–336
December 16th, 1925	The Hon. Mr. H. S. LAWRENCE, C.S.I., I.C.S., Finance Member, Government of Bombay.	336–342
December 21st, 1925	Dr. PROMATHANATH BANERJEA, Calcutta University	342–355
December 21st, 1925	Mr. VENKATAPATIRAJU, C.I.E., M.L.A., Vizagapatam	356–363
December 22nd, 1925	Mr. B. RAMACHANDRA RAU, Calcutta University	364–373
December 22nd, 1925	Mr. J. C. SINHA, Professor of Economics, Dacca University	374–381
December 23rd, 1925	Messrs. KENNETH CAMPBELL and F. V. RUSHFORTH, representing the Bengal Chamber of Commerce, Calcutta.	382–397
December 23rd, 1925	Mr. B. CHAKRAVARTI, Bar-at-law, Calcutta	397–400
December 29th, 1925	Mr. D. P. KHAITAN, representing the Indian Chamber of Commerce, Calcutta	401–416
December 29th, 1925	Mr. A. RAMAIYA, High Court Vakil, Madura	416–424
December 30th, 1925	Messrs. RAM KUMAR JALAN and KASTOORMAL BANTHIYA, representing the Marwari Trades Association, Calcutta.	424–435
December 31st, 1925	Mr. K. T. SHAH, University Professor of Economics, University of Bombay...	435–450
January 4th, 1926 ...	Messrs. NALINI RANJAN SARKAR and J. GHOSE, representing the Bengal National Chamber of Commerce, Calcutta.	450–455
January 4th, 1926 ...	Mr. H. STANLEY JEVONS, M.A., I.E.S., University Professor of Economics, University of Rangoon.	455–468
January 5th, 1926 ...	Mr. NORMAN MURRAY, Managing Governor of the Imperial Bank of India ...	469–480
January 5th, 1926 ...	Mr. T. K. DURAISWAMI AIYER, University Professor of Economics, University of Madras.	480–489
January 6th, 7th, 1926	The Hon. Sir BASIL P. BLACKETT, K.C.B., K.C.S.I., Finance Member of the Governor General's Executive Council.	489–522
January 8th, 1926 ...	Mr. C. J. HAMILTON, M.A., University Professor of Economics, University of Patna.	523–537

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON INDIAN CURRENCY AND FINANCE

AT THE IMPERIAL SECRETARIAT, DELHI.

FIRST DAY.

Tuesday, November 24th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NOROOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD ARTHUR MANT, K.C.I.E., C.S.I.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E.
Mr. G. H. BAXTER.
} (*Secretaries.*)

The Hon'ble Sir BASIL P. BLACKETT, K.C.B., called and examined.

1. (*Chairman.*) For the sake of our records, Sir Basil, your present position is that of Finance Member of the Viceroy's Council?—Yes, since January, 1923.

2. And, before that, you were Controller of Finance at the British Treasury?—Yes, since 1919.

3. And during that period you were engaged on many special Missions in connection with the international aspects of British finance?—Yes.

4. We have had the great advantage of a series of very full memoranda from you and from the officials of your Department which will save a great deal of time in developing the matters into which we desire to inquire. I would ask you in the first place one question upon the very full memorandum on the recent history of Indian currency supplied to us. We are perhaps interested in this only in so far as it casts light upon the future. I observe that you refer in the beginning of your own memorandum on the Indian currency system to the Government's policy in regard to controlling the available supply of currency. This is dealt with in the historical memorandum, but would you be so good as to tell us in broad outline what has been the general policy as to controlling the available supply of currency since the abandonment of the effort to fix the rupee at 2s.?—May I preface my remarks before answering that question by a statement of the capacity in which I am giving evidence? I wish it to be clearly understood that I do not appear to speak for the Government of India. I appear to speak simply as Sir Basil Blackett. The Government of India have not made themselves responsible for any of these memoranda. Naturally as a member of the Government I am in a position to say something about the views which the Government have held, but I am not in a position to say that any particular views that may be expressed by me are or are not at the present time the views of the Government of India.

5. I think that will be quite clear to the Commission?—Turning to the question that was asked, the position of course is specially known to me since January, 1923. The question I think relates to the action that has been taken by the Government of India since the time when it became evident that the effort to fix the rupee at 2s. in accordance with the recommendations of the Babington-Smith Committee had broken down. During the first period, after that was recognised, the chief anxiety of the Government was to recover control of the situation and prevent the necessity for continued additions to the currency and the resulting inflation of the kind that has been prominent in the history of the currency of some of the European countries since 1919. The Government were faced with the difficulty that they had a Budget with a very considerable deficit balance and a very large amount of early maturing debt or floating debt to be continually renewed. Their first effort was to raise money both in England and in India with which to pay their way and to reduce the amount of their floating debt. Fortunately, the seasons were good, and by April, 1923, they had succeeded in balancing their Budget, and by April, 1924, they had got rid of their floating debt, that is, Treasury Bills and ways and means advances. Meanwhile, owing to the general fall in prices throughout the world, there had been a considerable redundancy of currency in India, and it had been possible by various means to reduce the outstanding amount of circulating medium in India. But the exchange value of the rupee had fallen during that period as low as 1s. $2\frac{5}{16}$d. sterling, the lowest that it ever fell to in terms of sterling, though at one stage actually below 1s. gold. The figures are given in Appendix VII of the historical memorandum. It will be seen that in the middle of the year 1921 at a time when sterling was very considerably depreciated in terms of gold the value of the rupee, for example, in July, 1921, was 11 9/32d. in terms of gold.

As sterling improved, the rupee tended to improve with it, and as good monsoons or fair monsoons continued, by January, 1923, the rate of 1s. 4d. sterling was reached, and except, I think, on one day in August of that year, it never fell again below 1s. 4d. sterling, but it was not until October, 1924, that it reached the figure of 1s. 4d. gold. The steps taken by the Government of India during that period to assist the recovery of the value of the currency, which of course was immensely assisted by the world conditions and by good monsoons in India, were first of all to bring about a considerable contraction in the currency by paying off some of the Treasury Bills held in the Paper Currency Reserve and cancelling currency and by cancelling currency against sterling securities. The Government itself was able rather fortunately to finance a large part of its sterling liabilities during that period by means of repayments from the War Office in respect of war transactions of various kinds, so that an unusually large amount of sterling was available in London without remittance. In addition, big loans were raised in London in 1921, 1922 and in 1923. The last sterling loan was raised in May, 1923, for £20 million. Since that date, not only has no additional sterling borrowing taken place, but there has been some actual reduction in the sterling debt owing to the operation of sinking funds. After August, 1923, no further contraction of the currency has been found possible or desirable. The money market was very tight all through the busy season of 1923-24, and during that period additions were made to the currency against sterling to the tune of—well, the net amount during that year was about 6 crores, but the amount actually added during the winter was about 12 crores, because there had been a cancellation of some five or six crores in the previous summer. In addition, the system of allowing the Imperial Bank to borrow from the Currency Reserve against Hundis was brought into effective operation, and the whole of the 12 crores, to which figure the maximum had been raised from five crores by an Act of the Legislature in the summer of 1923, was borrowed. The result was satisfactory from the point of view of the busy season of 1924-25, when money was generally very much easier, but during that winter again some six crores were added to the currency by additions to the sterling securities. The action of the Government may, therefore, be said during that period to have been to control the expansion of currency by keeping a very strict hold over the amount of additions to the currency.

6. May I summarise it in this way by saying that natural causes—good monsoons, and so on—were tending to raise the value of the rupee during the whole of this period?—Yes.

7. And, so far as the Government was able to do it through the currency machine, the policy at first was to encourage the rise by putting on the currency brake until August, 1923?—Yes, the policy up till August, 1923, was to encourage the natural tendency to a rise by effecting some actual contraction of the currency which had been very considerably redundant after the war. After August, 1923, it was to check the tendency to further rise by making some additions to the currency.

8. One more supplementary question: is that process still continuing at the present time? In other words, do you feel that natural forces are still at work tending to a rise in the rupee exchange?—There is no means in the Indian currency system at present, so long as the sovereign is valued at 2s., for an automatic expansion of the currency. Its expansion depends on the action of the Government; and at the present moment, exchange being strong, there would be a natural inflow of gold under an automatic system, and the Government are effecting some additions to the currency.

9. I do not think I made myself quite clear. The last statement is what I intended to get at. I think you answered my question when you said that the exchange is still strong?—Yes.

10. And the Government are adding to the currency?—We have added three crores, I think, since the end of September against sterling, the object of that being to assist the situation in the market so far as necessary and to prevent exchange for the time being rising above what would be the gold par value at 1s. 6d. The difficulty of course always in dealing with this sort of question in India is that you do not really know, in the absence of an automatic currency system, what amount of additional currency it is safe to add during the winter until you are aware of the nature of the monsoon the following year.

11. (*Chairman.*) That is the last question I wanted to ask you on the historical aspect. Before putting the next question as regards policy which I was going to ask, I do not know if any member of the Commission has any supplementary question upon that historical aspect with which we are dealing.

12. (*Sir Henry Strakosch.*) As regards the contraction of the currency up to August, 1923, was it merely due to doing away with the inflational portion of the currency?—It is not easy, I think, to measure the extent to which the additions that were made to the currency during and immediately after the war had an inflationary effect and to what extent they were natural, but I should say that up to August, 1923, nothing more was being done than taking away what was redundant currency. The fact that exchange was continually below 1s. 4d. gold during that period indicates that currency was redundant.

13. (*Chairman.*) I now pass on to the next heading —the question as to what should be the policy as regards the stabilisation of the rupee, in regard to which we have also had the advantage of a memorandum from Mr. McWatters. Naturally, the first question we have to ask ourselves is whether the time has come to stabilise. Will you be so good in answering that question to consider in particular what possible influences have to be dealt with such as might make themselves felt in the foreseeable future as affecting general gold prices throughout the world. I have in mind in particular the influences which might be exerted by a change of the monetary policy in the United States, resulting in an alteration of the supply of gold available?—The effect of stabilisation in terms of gold must necessarily mean that, subject to the necessary qualifications, Indian prices will tend to follow the movements of world prices; and if the United States were to go in for a policy of a considerable expansion of credit, which they easily could do if they desired to on the basis of the gold that they have got, the result would naturally be a very considerable rise in world prices and consequently in Indian prices; and until other countries were on a gold basis, it seemed to the Government of India to be rather risky to tie India to the chariot wheel of the Federal Reserve Board, the phrase I used on one occasion, to tie India down to follow blindly the upward or downward movements in gold; but now that the United Kingdom, the British Dominions other than India and several of the countries on the Continent of Europe, including Germany, are on a gold basis, it does not seem probable to me at any rate that the United States would go in for a policy that would have the effect of a very considerable rise in prices; and there would be a check on any such rise owing to the outflow of gold to the other gold standard countries if they took steps to try and prevent a corresponding rise in their own prices, so that gold would be better distributed throughout the world and the effect of the action of one country would be less violent. It is, of course, a danger at any time, if you are on a gold basis, that the policy of some predominant partner may seriously affect your own position, but to answer your original question, it does seem to me that the time has come when it is safe to accept the risks of being tied to gold for the sake of the great advantages of stability of exchange.

14. Various awaited events have now occurred which made it desirable to wait, such as the return

of sterling to parity with gold; is any other event of the sort foreseeable for which it might be said that it would still be desirable to wait?—It would, of course, make everyone in the world a little happier about the future of prices if all the inter-Allied debts were settled, and France had safely arrived at Budget equilibrium and stability of exchange, but I think the big events that have recently happened, such as the return of Germany to gold, the return of the United Kingdom to gold and the temporary settlement of the reparation problems are of very great importance, and there is no single event to look forward to that would be of an importance comparable with the return of England to a gold basis.

15. I gather then it is your view that, as far as it is possible to foresee, the present time is as favourable a time as we are likely to have?—No one is at any time able to prophesy what the future of prices would be, but there is very much more prospect to my mind of a relative stability than there has been until recently.

16. (*Sir Reginald Mant.*) I have only one point to put: it is possibly an argument for stabilisation at present that if you do not stabilise, the rate of exchange will practically depend on the action of the Government?—So long as the monsoons are good in India, the rate must necessarily depend on the action of the Government in increasing the currency or not in accordance with the demands. If you had, on the other hand, a series of bad monsoons, there would be a considerable risk of exchange falling unless the Government took reasonable steps to contract the currency. The needs are subject to the operation of natural causes, but the Government has become the main factor on the question of the relation of the demand for currency to its supply, and until this Commission takes some action in any direction, that responsibility rests mainly with the Finance Department of the Government of India and the India Office.

17. You practically have to put some arbitrary upper limit?—Yes. We have really been in that position for the last year and more. When in October 1924, the rupee reached the parity of 1s. 4d. gold it was obvious that unless there was some definite action by the Government at that stage it might go up considerably further and this was leading to immense anticipatory demands for rupees which would have driven it in October, 1924, very quickly up to 1s. 7d. or 1s. 8d. sterling, though it probably might not have stayed there. The Government therefore thought they had to come to some temporary decision in the general interests of India, and the decision they came to was for the time being, that is last winter, to take such action as was necessary to prevent exchange going further above 1s. 6d. sterling. It was not announced as a policy, but it was actually followed and it has had the effect of preventing what would have been a considerable rise in the rupee and it was entirely up to the Government to take that decision, whether or not they wanted to stabilise and without reference to their undertaking to have a general inquiry before final action was taken.

18. (*Chairman.*) If it were decided that the time of ultimate stabilisation had not arisen, would you still think it would be necessary to fix on some temporary figure?—Yes; unless Government does something of that sort, you will have exchange driven up in a period like last October, by anticipatory demands, and possibly driven down again in the slack season, with very large fluctuations which would be independent of the movement of world prices. You would get neither stability of exchange nor stability of prices.

19. That would be very undesirable?—In my view very undesirable.

20. Sir Reginald's point is that you must take some measures to avoid violent fluctuations?—Yes, there is some responsibility on the Government at present which it cannot avoid.

21. And if you are to take measures to avoid fluctuations you must have some conventional point to which you should approximate?—Yes, you may change the conventional point from time to time; of course that would disturb business a good deal, but you must have some conventional point to which you are working.

22. Otherwise you cannot even tell what the fluctuation will be?—Quite.

23. (*Sir Purshotamdas Thakurdas.*) With regard to the legislation of 1920 which fixed the statutory value of the rupee at 2s., don't you think that also is an impediment until some decision is arrived at to have some other fixed rate?—There must be some rate on the Statute Book. The impediment is not so much that it is two shillings on the Statute, but that there is not an effective ratio on the Statute Book. Until you decide what the effective ratio is to be, you cannot very well alter the Statute.

24. That is what I meant, that an ineffective ratio also necessitates a temporary decision as to some point at which Government have to stabilise exchange?—Unless you adopt the view that your aim is to get back to the two shillings rate. If the Government had adopted the view that the aim was to get back to the two shillings rate their natural policy would have been not to make any additions to the currency at all in spite of the stringency of 1923-24, and the stringency that would have occurred in 1924-25.

25. But Government having declared a couple of years back that they do not aim at 2s., makes it necessary that a change should now be made as early as possible?—It makes it most important that there should be some decision.

26. (*Chairman.*) The next question I have to ask you is of central importance. Have Indian prices adjusted themselves to equilibrium with world prices at the present rate of round about 1s. 6d., or is there any reason to expect any substantial change in the relative values of Indian and world prices before such equilibrium is attained?—That question of course is a difficult one to answer. My own view is that there has been a very considerable adjustment of prices, though probably some more ought to come. If you will take the index numbers of prices in Great Britain, United States and in India at the present time—

27. May I ask if you are referring to any particular document before you when you speak on this point?—There are some figures in the historical memorandum. I thought I had later figures, but I don't think I have them here at the moment. Broadly speaking the level of prices is now at about 160 as compared with 100 in the pre-war days. British, American and Indian prices have come together at a figure about 160, which compares with a very different state of things a couple of years ago, say on the 1st of January, 1924, when the position was as follows:—

British	173
American	151
Indian	172

But I am not quite sure what value is really to be attached to any of these index numbers and particularly to the Indian one. It is hard to be sure that it is completely valid. At the same time it does suggest that prices have now come together and if an explanation is wanted as to the reason why with the rupee at 1s. 6d. now instead of 1s. 4d before the war, the rise should be much the same in India as in other gold standard countries, I think the answer is that there has been a very considerable development in the Indian tariff which would naturally raise the Indian figure. With exchange at 1s. 4d. as it was pre-war you would have expected Indian prices to be nearer 180. You will have really to multiply the Indian figure by 18/16 to get the proper comparison with pre-war figures, if you assume that the purchasing power of the rupee has accommodated itself to the rise from 1s. 4d.

to 1s. 6d. Generally speaking, there has been a very considerable readjustment of prices in the course of the last year. You will see that there is a considerable fall in Indian prices under certain heads when you get into details. I am inclined to think that there has been very little fall, if any, in wages. On the other hand there has been, as far as I can make out, a very definite tendency for Indian wages to rise since the end of the war. The level of real wages at the end of the war may probably have been lower in India than it was in the beginning because wages have gone up more slowly than prices —and there is a slight increase year by year in money wages. I have not got figures here, but I believe the Bombay Labour Office have got figures, and I should think the Commission could get them later. The money wages would show a natural tendency to go up all the time and the probability is that the rise in exchange has rather tended to prevent a further increase in money wages than to bring about a fall in money wages.

28. Are there any general statistics available with regard to the rates of wages and prices?—There are some statistics, the most elaborate of them are kept in the Bombay Labour Office, but I have never felt very confident of what the real value of these statistics is. In individual cases, no doubt, they are quite good, but when it comes to a general index number, for the whole of India or even for a large province, where the conditions are so different from one place to another, one rather doubts how far they are completely applicable. My general impression, however, is that most of the readjustments due to the movement in exchange since 1922 have now been effected.

29. As far as I can see, the index numbers to which you call attention are in steady approximation with those of other countries like the United States and Great Britain, and within what one might expect as reasonable limits of error in the index number they seem to show a present equality. In some figures supplied by the India Office in their memorandum No. 2, Appendix II, you will observe that between the India exported articles and India imported articles, there is a difference to a marked degree, the rise in the case of Indian imported articles being relatively greater throughout?—You mean by India imported articles which are imported into India?

30. Yes. I wish to know what would account for this difference?—I do not know whether the tariff has been taken into account. The tariff would account for a good deal, but not, I think, for the whole. Of course four good monsoons have tended to keep the prices of Indian food-grains and other agricultural produce, probably with the exception of wheat and cotton, down. I do not think that I can answer the question as to the special reason why the India imported articles throughout show a higher figure.

31. No doubt some of it may be attributed to the very large relative rise in cotton manufactures? —Very probably: cotton of course has been throughout the world very high.

32. In the memorandum No. 2, para. 2 (*c*), it shows the highest figure?—Yes.

33. But at any rate this difference between the relative level of imported and exported articles does not suggest to you any lack of adjustment or any lack of equilibrium in Indian prices in relation to world prices?—I think not. Probably it is more the lack of equilibrium not yet adjusted in world prices themselves.

34. One observes that India exported articles are mostly raw materials and India imported articles mostly manufactured articles?—Yes.

35. The tendency is for a greater rise in raw materials than in manufactured articles throughout the world: that is a statistical fact?—Yes.

36. (*Sir Alexander Murray.*) Since 1923 there has been very little change in the relative difference?—Yes; but the index numbers for both imported and exported articles were 100 in 1913.

37. (*Chairman.*) Sir Alexander's observations are material as showing that at present the difference is being maintained constantly?—Probably with the reduction in prices of imported cotton goods, the difference would be very much reduced.

38. (*Sir Reginald Mant.*) Is it not a fact that the same thing has taken place all over the world, that the price of agricultural produce has not risen to the same extent as the prices of manufactured articles, and that this has caused difficulties in all agricultural countries?—I believe it is a general world factor: in the United States, *e.g.*, I think it is a fact that the relative position of the farmer has been, with the exception of one or two recent seasons, rather worse than it was before the war. I do not think it is peculiar to India.

39. (*Sir Henry Strakosch.*) How do you account for the fact that the cost of living and retail prices in India are on a par with the United States and the United Kingdom prices, whereas the wholesale prices are still something like 11 and 11½ per cent. above the level of the United Kingdom and United States prices? The Indian indices are converted at the rate of 1s. 6d. gold?—You get the cost of living figure here. I see here for July in Bombay it is 157 as against 100 in 1914, whereas in the United Kingdom it is 173 against 100. If you multiply 116 by 18/16 you get about 177 or 178.

40. The same applies to retail figures?—I confess always to a considerable hesitation in accepting the full value of any of these costs of living figures in any country, and I have never been quite certain as to their correctness or how far they correctly give you a picture of the facts. But over a long period the comparison is a just one; it does seem in that case that there has been a complete readjustment to the present exchange position.

41. (*Sir Purshotamdas Thakurdas.*) You said that there has been very little fall in wages—if any thing a rise—since 1923. Also that there has been a fall in the values of raw materials exported from India. Practically there has been, therefore, a reduction in the value available to the grower—the grower has to pay the same wages in 1924-25 as in 1921-22 and owing to the fall in prices therefore he has received less on the production of his raw material?—To some extent perhaps: but since 1900 there has been a regular tendency to increase in wages in India irrespective of the movement of world prices. Presumably it is really an indication of a gradual improvement in the conditions of the labourer. Whether the effect has been improvement in work or not I do not know.

42. If you take the figures of any ten years you find that the rise in wages has been more than made up for by the rise in the value of the raw material?—I do not think so. I think there has been a general tendency for an improvement in the real wage of the labourer.

43. With simultaneous improvement in the value of the raw material?—There may have been an improvement in his outturn. But the increase in wages has been irrespective of any change in the prices. Of course between 1914 and 1920 there has been a considerable reduction in the real wage because the increase of prices was not, at any rate in the earlier part, anything like compensated by the increase in money wages. The position has been reversed since 1920.

44. And therefore you say there has been a reduction from 1914 to 1924?—I think the real wage is higher all over India than it was in 1914. But in 1920 the real wage was probably lower than in 1914, because there had been a very steep rise in prices and there had not been a correspondingly steep rise in wages.

45. The rise had come on after 1920 more definitely?—Yes in real wages.

46. At any rate it was felt by the public more definitely since 1920?—Yes.

47. You would not agree that the result of the reduction in the prices has already been a reduction in the net return to the grower because the wage has remained the same as, say, in 1920 or 1921?—Of course a great many growers do not pay wages.

48. Those of them that do—those who have to cultivate by the acre and have to pay wages—the reduction in prices has meant to them a net reduction in return because they have had to pay the same wage?—I think you ought to take the whole period from 1914 to 1925 together in dealing with this because there have been movements up and down during the period, and I think there is always a tendency for a steep movement in prices to leave money wages behind—wages come along more slowly; changes in the rates are more slow; if you go back to 1914 I think it is probably true that the real wage of the labourer is higher now than it was in 1914; if prices are exactly the same proportionately it is a logical deduction that the wages are a larger element in the total cost of production than they were in 1914; but as against that you have the question whether the improvement in wages which had been going on before the war, and may presumably go on still, is resulting in an improved outturn.

49. Do you think that since 1921 there has been any improvement in outturn also in agriculture?—I do not know. But I suggest that the continual tendency in India for slow improvement in real wages is probably paralleled by a slight improvement in outturn.

50. Thus making up for the increased cost to the cultivator?—That is what one would hope.

51. (*Sir Purshotamdas Thakurdas.*) That is a matter for investigation, of course?

51A. (*Chairman.*) Index numbers are not wholly reliable. Is there any other source of information which you can suggest that would throw light upon the question of the adjustment of Indian prices to world prices at the present level of exchange?—One has, of course, general indications. There are examples here and there in the recent reports of the Tariff Board in regard to the cost of production of things like steel, paper, and so on, some of which are quite interesting, and there are further reports coming out—dealing with investigations by the Tariff Board—into claims for protection of particular industries, such as steel, cement, paper, and so on. The earlier reports did not, I think, as a rule say much on the subject except to assume that if a certain amount of protection is required at 1s. 4d., you need 18/16 of it at 1s. 6d.; but the later reports have gone in some detail into the matter and shown to what extent in certain cases the rise in exchange has been compensated by a fall in the cost of materials, and what proportion of the cost has been modified by the rise in exchange. Then I suppose you could get some information from the Commerce Department or the Director General of Commercial Intelligence.

52. (*Sir Henry Strakosch.*) Arising from that, do you not think that it would be advisable that some authority should undertake to produce regularly some scientifically constructed index figures?—It is most urgent *desideratum*. Some of the members of the Commission know that a special committee was sitting recently on the subject of a general economic inquiry. They at any rate show that it will be very costly, and also some of the difficulties in getting reliable statistics, and one has to remember that India is a large continent, and a general index number for India is not always a satisfactory indication of particular conditions. But I agree entirely that some very much better statistics than we have got at present, if they could be got, would be most desirable.

53. (*Chairman.*) To continue the next step, let me put the supposition that some other level were adopted than the presnt ruling level of exchange. By what methods could exchange be raised or lowered to whatever different level were selected?—This matter is dealt with in the memorandum on stabilisation of exchange, and I am not sure there is very much that one can add to that. So long as the present conditions continue, where there is a large surplus of Indian exports over Indian imports, the action of the Government in adding or not adding to the currency would no doubt be fairly effective unless it caused so much stringency as to bring about a disaster. An effort to raise the exchange at the present moment, e.g. from 1s. 6d. to 1s. 8d., would involve very considerable readjustment of prices, and you would have to try to force that readjustment by making the rupee scarce. It would be a very uncomfortable period for a good many people unless, as happened a year ago, it happened to coincide with a general rise in world prices, in which case you would have the same level of prices in India. You would then by raising the exchange keep the same level of prices instead of rising with the world prices.

54. I gather you can only do that under certain conditions?—You can only do that if you have had a good season, and there is the further complication that one does not know how far the import of gold on private account may tend to make any effort to make the rupees scarce ineffective.

55. You tell us that evil consequences are probably to be feared from monetary stringency?—Industrial difficulties and, of course, possibly strikes owing to efforts to reduce wages.

56. And a general impediment of the export trade?—Probably, unless there was a corresponding movement in the world prices, an impediment to the export trade.

57. Now, turning to the other side of the picture, the possible lowering of the rate, let me ask you in particular, in your opinion will it be easy to stop the fall of the chosen rate?—Not unless you had some more definite system of doing it than we have at the present moment. If you are willing to give gold for rupees or rupees for gold, or rupees for exchange or exchange for rupees, at a fixed rate, the contraction that would be required or the expansion that would be required would become more or less automatic instead of being subject to the fiats of a Government department. But I think that you are always, as I said before, in this difficulty, that there are risks in expansion of currency in the busy season in India because you do not know what the nature of the next monsoon is going to be, or the amount of the corresponding contraction required in the slack season.

58. In the memorandum on exchange at page 7, dealing with this position of the attainment of a lower rate, a description is given of how the rate would fall, and Mr. M. C. Watters continues: " There is always a considerable amount of latent demand for remittance to England, and if the decision to adopt a lower rate were announced, remitters would at once endeavour to obtain the best price for rupees. The tide would then turn the other way, and there would be a very large demand for rupees at the new rate. This would have to be met by additions to the currency." How could that be checked?—I think you would have to be prepared to give currency in exchange for sterling without limit. Of course it would depend on any other decisions as regards the nature of your reserve, but if you are prepared to buy exchange without limit at, say, 1s. 4⅛d., assuming the par-rate to be 1s. 4d., or whatever the exact gold import point might be, and use the sterling that you get for these rupees as cover to add securities to the currency reserve, and pay the rupees out here by additions to the curreney, you can, I think, meet all demands that way from a technical point of view. Undoubtedly there are always difficulties that you may overdo it and create a boom by that action, and cause later on a slump when the reverse process has to take place.

59. Might I put it in this way, that it might possibly lead to a series of rather violent fluctuations?—It would probably lead to one or two big swings before the pendulum swung at all even or came to a standstill.

60. Just to complete the picture of this hypothesis of the adoption of some new rate, higher or lower, can you tell us what would be the effects of this process upon the people, dividing them for this purpose into the creditor and debtor class, and looking upon the situation from the point of view internally of the exporter and externally of the importer. Let us consider first of all the financial effects upon them of the change in rate either up or down. There are a good many alternatives, and perhaps we cannot contemplate them all. Let us take, first, the possibility of a higher rate?—I assume that a higher rate would mean a corresponding reduction in prices. One must make that assumption to consider the thing logically. The effect presumably, for example, of a 1s. 8d. rupee would be to cause a fall in commodity prices to something like 18-20ths of the present position.

61. What would be the social and political effects of such a fall?—It means from the point of view of the debtor that his existing money debt becomes a larger one in terms of commodities. It means in the case of the creditor that his credit is worth more in terms of commodities than it was before. From the point of view of the wage-earner it is equivalent to an increase in real wages by means that are not as obvious either to him or to his employer as perhaps a direct increase would be. It would probably lead—almost certainly at the present time in view of the recent fall in Indian prices—it would lead to a considerable pressure in some industries, to an actual reduction in wages and possibly a strike. On the other hand it would mean that all those on fixed salaries or those who received customary wages—a great many wage-earners — would be better off in terms of real wages. Its effect, I think, would be worse on the Indian industrialist who is in competition with foreign imports, particularly such industries as the steel industry and the engineering industries generally, which are comparatively a new feature in India, and on the cotton mill industry. It would probably mean a considerable increase in the demand for protection already given and in our protective tariffs—though the effect, of course, would be presumably only temporary, and you may assume that within a comparatively short period of time most of the readjustments would take place; but there are some which take a long time, such as, for example, the rates for postage stamps or railway fares. They are not always brought down or brought up very quickly following on a change of this sort. Then there is the land revenue. There, of course, one really wants to take a very long view because it changes very slowly. A settlement is made usually once in thirty years, leaving out the permanent settlements; and in that case you have had such big changes in the last 11 or 12 years that one change more, as the effect of 1s. 8d., for example, would still leave the land revenue payer relatively better off than in 1914 because prices have gone up to such an extent that he has been paying a less amount of commodities: the land revenue has been worth less in terms of commodities in most cases, than was intended at the time of the settlement. It would take thirty years for the land revenue to be readjusted generally throughout India.

62. Is thirty years the average period of a land revenue settlement?—Sir Reginald Mant could probably give a better answer than I could.

63. (*Sir Reginald Mant.*) It is not the average; it is rather the maximum. Sometimes new settlements are made at shorter periods.

64. (*Chairman.*) What proportion of the land revenue is under a settlement of this sort?—I have not got figures.

65. We can obtain them from another witness?—Yes. The effect, of course, on the Government, both upon the local budgets and the Central budget, would be a considerable reduction in the rupee payment required to meet external charges and presumably that would enable either a remission of taxation to be made or provincial contribution to be further reduced.

66. Would that be a permanent effect?—No. But it is sufficiently long to justify the Government acting on the assumption that it will reappear budget by budget for a sufficient period to justify your using the surplus that comes in that way for immediate remission.

67. And, conversely, its effect on the importer, as compared with the Indian manufacturer?—Naturally a readjustment takes place; the rate of exchange has been raised, and therefore the amount of sterling or other local currency that the exporter from another country gets for the goods he sends here, is increased without increasing the rupee price, it makes India therefore a good place to sell in for the time being.

68. Hence the demand for increased tariffs?—Yes.

69. And on the exporter?—The exporter from India is getting less rupees for his exports, and until readjustment takes place those rupees do not go so far as the larger amount of rupees that he got before, so that he is for the time being worse off.

70. Then turning to the possibility of the selection of a lower rate, what would the effect of that be upon the population of the country, taken as creditor and debtor, and viewed with particular reference to the wage-earner and agriculturist?—Broadly speaking, it is just exactly the converse of what I said except that in the case of the Government it would mean presumably that the Government would have to make it up at once by extra taxation.

71. That, again, might be counteracted by gradual readjustment?—It may ultimately, but you would have to act at once if you wanted to avoid a series of deficits in the budget.

72. And the effect upon the exporter and importer would also be the converse?—It might. There is always the danger that it may encourage under-production or over-production and bring about undesirable results in that way.

73. Which will have that effect?—A fall in the exchange may, of course, lead to a boom which would mean over-production of particular articles. A rise in the exchange may lead to a boom in imports which may lead to overstocking and the difficulties arising therefrom.

74. I think that exhausts the various alternatives?—One is necessarily speaking in a rather theoretical atmosphere in answer to hypothetical questions of this sort; so much depends on the exact circumstances of the moment at which these changes are taking place.

75. Your contention is that if you select a higher rate of exchange and that coincided with a bad year, the gravest difficulties might be encountered?—You would have to use up a large amount of your sterling reserves for the purposes of making the new rate effective and it might take really a long time to make the rate effective, if you had a series of bad monsoons. On the other hand, if you have a good monsoon and good trade, you do risk very severe stringency.

76. (*Sir Henry Strakosch.*) I think you were dealing with the evil effects of the adjustment which has to take place between internal and external prices on any change from the point at which internal and external prices have already adjusted themselves?—Broadly speaking, from 1914, there has been a continual adjustment owing to the vagaries of world prices and world exchanges and currency policies all over the world; we have, as I see it, been trying to remedy those mal-adjustments, and in India we have had for over a year now stability in the exchange at 1s. 6d. sterling and for nearly a year stability at 1s. 6d. gold. During the last year there has undoubtedly been a considerable movement in the direction of remedying the previously existing maladjustments, and they are not yet complete. Any change from the present rate therefore must mean setting up a new series of maladjustments, which will take some little time to

remedy, and means continuing instability as between internal and external prices.

77. What is the effect of a new basis on the long term creditor and debtor?—Of course, if it is a contract not subject in any way to revision and if prices remain unchanged, an increase in the rate of exchange must mean that the creditor gets a larger commodity value for what he lent and the debtor has to pay a larger amount by way of interest and repayment of the principal. But the difficulty in this case seems to be that not only have you had very frequent changes in the rates of exchange since 1914, but you have had very large changes in prices during that period, and you have had a change in prices from 1900 to 1914 all over the world which in itself was something of a revolution in favour of the debtor. Prices during that period rose 10 or 15 per cent. at least; so that it is perfectly impossible to suppose that you can arrive at a solution which will do absolute justice both to the creditor and the debtor at the present moment.

78. That is to say, at no point could justice be done to the long term debtor or creditor?—It is quite impossible unless you regard very strictly the terms of his contract which was to pay a certain amount of money without reference to what that is worth, which is, I suppose, the legal assumption.

79. (*Prof. Coyajee.*) It has been argued that the higher rate of exchange—the rise from 1s. 4d. to 1s. 6d.—and the consequent fall in prices has been very injurious to the Indian agriculturists. What is your view of the matter?—As I have said in answer to a previous question, I think you have to take this over a long term. The rate of 1s. 4d. gold was not in force for more than a month during 1924. It is a rise if you go back to the lowest point from something under a shilling to 1s. 6d. in terms of gold. In terms of sterling it has been different. Similarly there had been a considerable fall previously. If you go back further it is a fall of exchange. So that it is rather difficult to start at 1s. 4d. and say the rise from 1s. 6d. has had particular effects. I think it was the Babington-Smith Committee's Report which had about 10 paragraphs dealing fairly exhaustively with this argument. The conclusions are not very definite, and it is difficult to come to any conclusion in any particular case which is valid for anything more than that particular case. I do not think you can take the agriculturist simply from the point of view of what he gets for his produce. In so far as he produces a surplus, he wants to spend that surplus, and what really interests him is what amount of commodities he gets for that surplus.

80. So that the fall of prices is beneficial mainly to the big agriculturist?—It is beneficial to the consumer generally.

81. The big agriculturist is a consumer?—Everybody is a consumer.

82. (*Sir Henry Strakosch.*) But only during the period of maladjustment?—Yes.

83. (*Prof. Coyajee.*) We recently saw that the rise in agricultural prices produced agrarian unrest in the Punjab?—It was, I think, rather fortunate from the point of view of the Punjab last year that there was a rise in exchange, because there was a temporary rise in food grains, particularly wheat, in spite of the rise of exchange, which would have been much more if it had not been for the rise of exchange, and even with that rise there was a certain amount of agrarian unrest.

84. As regards the financial position of the Government of India in repaying the sterling debt, is a rise in the rate of exchange beneficial?—It is beneficial in this sense that it reduces the number of rupees required; but as it is a part of the hypothesis that as soon as readjustments have taken place a smaller number of rupees has the same commodity value as the previous larger number, the commodity value of the payments that have to be made in the United Kingdom is not finally altered.

85. (*Sir Purshotamdas Thakurdas.*) Regarding the land revenue, any rise in exchange practically means that the Central Government prevents the Local Governments from having their share in the increase of prices to the extent of the difference between the two exchanges?—I do not quite follow.

86. That is, whenever there is a rise in exchange the provincial Government get, to the extent of that rise in exchange, less advantage of the rise in prices on raw commodities?—If there is a rise in exchange, the Provincial Government get the same amount.

87. I will illustrate it. Suppose the last settlement in the Punjab was on the basis of, we will say, Rs. 200 for cotton. Cotton prices go up to Rs. 300 before the next settlement comes on, and but for the rate of exchange (1s. 8d.) Rs. 300 can be available to the grower. To the extent of that extra Rs. 100 which the Provincial Government would be able to tax the cultivator at the time of settlement, the rise in exchange has to be discounted. Is it not so?—That is thirty years afterwards. You have to look at it this way. What interests the Government is the purchasing power of the rupee that it gets. It presumably gets the commodity value out of the land revenue as fixed thirty years hence equal to what it would have done if the exchange had been different.

88. Would you agree that thirty years hence the reduction does happen?—Thirty years later it may fix the land revenue in that particular instance at a different figure and a lower figure than it would have done but for the rise in exchange. That is, it fixes the land revenue thirty years later at a smaller number of rupees; but those rupees would have a larger purchasing power than they would have had if the exchange had not gone up. So that the Provincial Government is getting exactly the same commodity value out of the land revenue as before.

89. Therefore the smaller number of rupees that the Provincial Government gets does not matter to it?—Not at that stage.

90. Now that period of thirty years may come on a year hence or, say, in 1928 or 1930. For, the settlements are not uniform all over India. For instance, in Bombay, they go on revising the settlement in one district or other practically every year?—It is not any single period of thirty years. The particular district will be reassessed every thirty years.

91. Therefore, in a particular place, a bunch of districts may fall within the next five years?—Yes.

92. In that particular case, will it not be a hardship on the Provincial Government?—It may possibly be in the first year when the adjustments have not yet taken place to the extent justified by the rise in exchange. But probably by the second or third year there will be very little in it. Meanwhile several of these Provincial Governments would have as a matter of practice had a very large reduction of their provincial contributions as a result of the rise in exchange, enabling the Government of India to reduce the provincial contributions.

93. The Government of India are committed to reducing them whenever they had a surplus. Suppose something else had brought in a surplus, irrespective of the rise in exchange?—It is really the change in prices that is ultimately of importance rather than the change in exchange. It is, broadly speaking, the reduction in prices generally after the war that has brought down the total expenditure of Government, apart from the definite retrenchment activities and things of that sort; but a reduction of prices is only another aspect of a rise in exchange.

94. And a reduction of prices brought about by a rise in exchange does mean, to that extent, a loss to Provincial Governments in their agricultural revenue settlements?—I do not admit that there is any real loss.

95. I would like to understand that if I may?—I admit there may possibly be a slight "loss," to use that particular word, in the first or second year. But meanwhile you may say that there has been a considerable loss to the Central Government owing to the fact that prices have come down roughly from 200 since the Meston Settlement to 160 now, and the Provincial Governments have got the benefit of the whole of that.

96. Would there be a clash to that extent in the interests of the local Governments and the Central Governmont?—I do not think there is any real clash of interests in the matter.

97. Suppose a Presidency, for instance, Bombay, has an income of six crores from land revenue and the land settlement for, say, four of their important districts fell due before 1929. Would that not be a material handicap to that Presidency?—I believe it would be negligible, and meanwhile they would be getting advantage to the extent of a slight reduction in prices brought about by the rise in exchange. And their revenue might go further than it did before.

98. Suppose an important article is concerned?—Even then.

99. Owing to the lower range of prices?—Yes.

100. I do not know, Mr. Chairman, if Sir Basil is prepared to answer, but I want to know whether the Government of India in the Finance Department had any communication from the Provincial Governments on the particular aspect of land revenue?—I have no objection whatever to answer. I have certainly heard nothing about it. I do not think we have had any official correspondence with any Provincial Government on the subject of the rate of exchange. But unofficially, they have all been, I think, delighted with the results of the improved position of the Central Government and the reduction in prices which enabled them to improve their Budget position.

101. That is as far as provincial contribution?—Yes, and their general position.

102. In connection with their land revenue settlement, have they made any representation?—No.

103. (*Sir Reginald Mant.*) May I take the discussion a stage further. I think you may take it that any Provincial Government aims at a continuous process of resettlement. It has to keep its establishment evenly employed. Taking 30 years as the normal period of settlement, we might for purposes of our discussion assume that the average settlement has 15 years to run in judging the effect of a rise in exchange?—It is normally 30 years, so that 30 years is the average and not 15.

104. In any case, the average settlement has a considerable period to run, a large unexpired period, and during that period does not a local Government benefit by a rise in exchange?—Certainly.

105. Would not this gain on account of the rise in exchange be greater than the loss just now indicated? —The loss is very hypothetical in any case, because as a matter of fact the tendency is, as a rule, to raise the assessment at each revision and there is a limit on the money amount. Let us take it there is a rise in the exchange: the fall in prices makes it a little bit easier to raise the money assessment to the full quota than it would otherwise, so that the loss is in any case hypothetical. I entirely agree with Sir Reginald Mant that if during the 15 years under this hypothesis prices are lower, and they are getting the same land revenue as before, the Provincial Government are gaining as the result of the rise in exchange.

106. In fact they are in the position of any long-term creditor?—Yes. Of course, broadly speaking, owing to the movements of prices and of the exchange during the last 20 years, the land revenue payer has been better off than he was intended to be and the Provincial Governments have in fact lost over that.

107. In discussing the effects of alteration in the rates of exchange, you assume the stability of external prices?—Yes.

108. If prices were to rise generally as was experienced last year, the effect you describe on internal prices would not follow if exchange were allowed to rise. In fact there was a considerable rise in exchange last year without a corresponding depression in internal prices?—If there were to be a steady or a large rise in world prices, you might theoretically do what we did during 1924. But I would point out that it has been largely reversed in 1925. What we did in 1924 was to let the exchange absorb the shock rather than the prices. Instead of the prices going up by 12 per cent., we let the exchange go up by 12 per cent.. and prices remained stable. Theoretically you can do that, of course.

109. Suppose we stabilise now and there was a subsequent considerable rise in world prices; the prices in India would naturally rise also?—Yes.

110. Do you anticipate agrarian difficulties then?—One hopes for reasonable stability of prices from the point of view of social and political contentment, because changes of prices, particularly rises in prices, do tend to cause unrest.

111. Would you say that the prices of food grains are as high as they can safely be allowed to go?—The prices of food grains are low in comparison to other prices at the present time in India mainly as a result of a succession of good monsoons. I do not think that even wheat is high in proportion to some other prices.

112. You do not think it is near the safety margin? —It has been higher than that, has not it? But there has been trouble and I think it is undesirable that there should be any large rise in the price of wheat.

113. That is bound to follow if there was a large rise in the world price?—If the rupee is stabilised in terms of gold, Indian prices must inevitably tend to follow world prices and to suffer a considerable rise if there is a considerable rise in world prices. That is unavoidable.

114. Do you anticipate a change in the world prices?—The Chairman put a similar question and I gave the best answer that I thought of at the time. One really cannot say. My inclination has been for some time to expect a fall rather than a rise. A considerable fall has taken place.

115. (*Sir Purshotamdas Thakurdas.*) Taking the converse: when the world prices go down, what would you do to absorb the shock?—You can do it over again; you can make the exchange again absorb it. That is what had happened during the period from 1919 to 1922. The exchange was absorbing the shock and preventing the large fall in Indian prices that would otherwise have taken place, so that the movement in Indian prices was a great deal less than the movement in world prices. It was after all exactly that point that led to the breakdown of the attempt to work the Babington-Smith Committee's proposals. The historical memorandum, first paragraph of Section 15, says: "In March, 1920, in view of the large sales of Reverse councils which the Secretary of State was unable to meet entirely from his Treasury balances, he was compelled to begin solling out the sterling securities in the Paper Currency Reserve. In the absence of special legislation permitting increased investments in Indian securities, it would have been necessary to cancel notes to the full rupee equivalent of the sterling socurities sold." And it was not done. Exchange was allowed to absorb the shock instead of prices. That was the point at which the attempt to enforce the Babington-Smith Committee's proposals broke down.

116. When it is a question of stabilisation of exchange at a point for a number of years, would you expect the same change to come on, namely, exchange absorbing the shock of lower prices?—If you decide on stabilisation of the exchange value of the rupee, you give up the power to use the exchange as shock absorber.

117. And therefore at that point this question arises whether the price level here is sufficient to

ensure to the grower a living wage?—I do not think you can make much permanent difference to the position of the grower or anybody else by choosing one rate of exchange rather than another. You may make a short temporary difference to him and that is all. That is my view.

118. When the commodity prices of other articles are higher than the difference in prices of food grains? Referring to Mr. McWatters' memorandum (App. 4, page 40), even in view of these figures, I understand you would say that the prices for the cereals and pulses at 128 and 138 should be considered to be quite sufficient?—I said in particular in the case of wheat only, that I would see objection to any very large rise.

119. What about cereals and pulses?—I have no doubt that the moment there is anything in the nature of a poor monsoon, those prices will rise.

120. Taking a normal monsoon and taking a decline in the world prices, as is the case at present with cotton?—Cotton prices have been very exceptionally high. They have been out of adjustment with the world prices.

121. Supposing there was a slump in the prices of other articles, say oil-seeds, cereals and pulses and wheat—you find that wheat did sell at Rs. 3 a maund only last year or the year before, and in fact we did not know what to do with it at that stage. At that stage, you would have no protection for the grower in the shape of the exchange absorbing the shock of lower prices?—That is so. That is the penalty of stability of exchange and necessarily of all stability.

122. And therefore at a time when the question of stabilisation of exchange is under consideration, the question also whether the prices available to the grower are sufficient and do leave a sufficient margin against declining prices later on must be considered? —I do not think that those prices are relevant to the question of what rate you should stabilise at. If it is a fact that one of the permanent results of the war is going to be to leave the agricultural prices lower in relation to manufactured articles than pre-war, that is a world movement which you would not in any way alter by fixing your exchange at 5s. or 1s. *or* half-a-crown. It will be entirely unaffected. You cannot permanently improve the position of the agricultural producer or of anybody else in relation to his fellows by the particular rate of exchange you chose to stabilise at.

123. Take any raw produce country like America, do they devise anything like this for the control of prices in America?—They have been attempting, of course, to control commodity prices through gold and the Genoa Conference recommended that after stabilising in terms of gold, there should be efforts made by co-operation between the central banks of the world to prevent large fluctuations in commodity prices by the management of the gold reserve in such a way as to ease credit when prices were tending to fall and tighten credit when prices were tending to rise.

124. Do I understand that they are doing something on the lines of what is happening in India, namely, control of prices available to the grower by a change in the ratio?—It has nothing to do with the relative position of the agriculturist and the industrialist. It is merely an attempt to try and avoid fluctuations in prices of commodities generally. But when I say it is an attempt, it is a very inchoate one, and one could hardly say that anything much has yet been done in that line. It is in a very early stage.

125. (*Sir Henry Strakosch.*) Is it not a fact that monetary policy is incapable of controlling maladjustment of prices *inter se*?—Entirely so.

126. Therefore, stability of general prices still leaves, under whatever system of currency you may choose, the possibility of wide fluctuations between the prices of one set of goods in relation to the other?—That is so. But at the same time when you have comparative stability of prices generally, the probability of any violent maladjustments between the prices of one kind of commodities and another is probably less than during a period when you have got a general disturbance of prices.

127. Is it not a fact that the dispersion of prices is now gradually tending to adjust itself?—So far as one can see, yes. But it by no means is a necessary postulate that prices of agricultural products will settle down in the same sort of relation to the prices of manufactured articles as they were before the war. There will probably be many large variations in the relative level of particular prices as adjusted, say, in 1935 as compared with 1914.

128. That would become less if the general level of prices is stabilised in terms of gold in most parts of the world?—Yes, though further changes are latent, as between the relative value of one commodity and another. . . . .

129. (*Chairman.*) We have now dealt with the question of a change in the rate by considering the alternatives of raising the rate or lowering the rate: to complete the picture we will deal now with the third alternative, that is the stabilisation of the rate at its present level. We have already cleared the ground to a large extent, but I think it would clear our minds if you would tell us what in your opinion would be the advantages and disadvantages of stabilisation at the present level?—There is always a very strong onus of proof falling on those who wish to change the level from any existing one. If you can assume that there has been even a considerable adjustment to a given level, even if the adjustment has not been completed, there are always very strong reasons for not altering that rate unless you have much stronger reasons for altering it than for not altering it. It is a *de facto* rate and therefore it holds the field. It does not need to defend itself or to disprove the claims of those who say that some other rate is better. It does not need to disprove the claims of those who think some other is better, but to leave them to prove them. The Budget of this year, for instance, is an instance in which an adjustment has been completed. It takes the 1s. 6d. rate: we have made considerable remissions of provincial contributions on the basis of that rate. There is an adjustment which may be said to have been completed. If there is a change in the downward direction, you would either have to take back the provincial contributions that you have given up or to impose some kind of new taxation or at any rate to postpone some remission of taxation that you may have in mind.

130. Then you would say, in the first place, as regards the advantage of stabilisation at the present rate that the present rate is the result of the interplay of natural forces?—Yes.

131. In the second place, the adoption of the present rate avoids the disturbance which was described as attached to either raising or lowering the rate and their attendant dangers?—Yes.

132. Is there any more positive advantage?—There is only one argument that I know of which is positively in favour of one rate rather than another, as between 1s. 4d. or 1s. 8d., and that is the argument connected with the value of the bullion in the rupee. Otherwise I think there is very little to be said in favour of 1s. 6d. as against 1s. 4d. or 1s. 8d. as against 1s. 4d., except that very minor argument that 1s. 4d. makes the anna and the penny of the same value, or that 1s. 8d. makes the sovereign exactly Rs. 12.

133. How much importance do you attach to that? —I think it is just worth mentioning and nothing more. The equivalence of the anna and the penny has some advantages. It is the habit of the ordinary British soldier to treat the anna and the penny as interchangeable for purposes of thinking in rupees, and sometimes if you have penny rates there are considerable complications in accounts. But it is all only just worth mentioning. I may just add for the sake of completeness that a good deal that is

said about the undesirability of the 1s. 6d. rate is really an argument to the effect that the Government of India made a mistake in choosing that particular point to stop at. As was pointed out a little earlier, the Government of India had to do something, to fix on some rate to use temporarily and the rate they fixed on was 1s. 6d. sterling for the time being. The argument that they ought to have fixed on some other is a quite different argument from the argument that they ought now to go back from 1s. 6d. to some other rate. It is often argued that the Government of India did a wrong in fixing on 1s. 6d. and that they ought to have stopped at 1s. 4d. gold. That is brought forward as an argument for going back. Now it has really nothing to do with the argument whether or not the 1s. 6d. rate, the present rate, is or is not desirable to stand at. It involves the undoing of a good deal that has been done in the course of the last year or 18 months.

134. Let us now go back to the point you raised before relating to the price of silver affecting the policy of stabilisation at one rate or another. First of all, as regards the bullion value of the rupee at various rates, figures have been given in paragraph 6 of the memorandum on stabilisation by Mr. McWatters?—The history of the war shows that under the Indian currency system the rupee as unlimited legal tender is completely at the mercy of a rise in silver, so that the bullion value of the silver content of the rupee becomes greater than its currency value. At 1s. 4d., the margin between the bullion value and the currency value is the margin between 43d. and whatever lower figure may be ruling; at present it is about 31d. You have therefore a larger margin at 1s. 6d. It is the only argument that I know—the only absolute argument—in favour of a higher as against a lower exchange or *vice versa*. One certainly does feel more comfortable with that larger margin.

135. The argument there is that the higher the rate of exchange fixed upon, the greater the margin of safety as regards this particular danger?—Yes.

136. What real importance do you attach, for instance, to the additional margin of the difference between 48d. at 1s. 6d. and 54d. at 1s. 8d. in view of the present price of silver? Do you think it is a substantial consideration to be taken into account?—That is a consideration undoubtedly. But I should not regard it as in any way justifying, on that account alone, the very considerable disturbances involved in attempting at the present moment to raise the rate of exchange.

137. What is your view of the future of the silver market?—If I knew more about China, I might have a view. I have always felt that, other things being equal, silver seems recently to have been a very good index of general world prices.

138. Silver prices move at present with general commodity prices?—Yes. Silver is a very good index of general commodity prices since the war.

139. That would lead you not to expect any violent fluctuations in the silver market apart from the movement of general prices?—Unless you get some big, unexpected unloading of silver on the market or unexpected demand for silver such as at present is possibly being caused by the disturbances in China. I should not regard the argument as justifying on its own account an actual change being effected in the *de facto* rate of exchange, whatever it might happen to be—unless it happened to be a shilling, when it would be almost essential either to recoin the rupee or increase its margin of difference.

140. Having a margin of the difference between 33d. and 48d. at 1s. 6d., any additional ease that you would gain by rising to 54d. would not be of first importance?—I do not think either of them are very strong arguments in relation to the others.

141. (*Chairman.*) Have any members any supplementary questions to ask on this point of the price of silver and the rate of exchange.

142. (*Sir Reginald Mant.*) As regards the present level of exchange, I think it would be well to have on record the reasons why the Government of India considered it advisable to stop at 1s. 6d., as there may be criticisms of its policy in adopting this rate?—Well, the time had come when Government must intervene effectively to prevent an unlimited temporary rise, and that decision was taken in October, 1924, at a moment when in the absence of such a decision there would have been, as I said, a very large speculative or anticipatory demand for rupees by people who knew they would want rupees in the course of the busy season and wanted to lay them down before they got too expensive. In the absence of that action there is no doubt that the exchange would have gone to 1s. 7d. or 1s. 8d. even within a few weeks at that time and probably it would have come down with a slump, not necessarily below the figure of 1s. 6d., but would certainly have come down at some time at a later period. You would also have had a repetition of the severe stringency in the money market which had caused a good deal of comment, and legitimate comment, I think, in India the winter before. The Government therefore felt that some action must be taken pending a final decision to prevent a very violent fluctuation in exchange independent of prices during the winter of 1924-25. By the time the winter of 1924-25 had come to an end, the decision had practically been taken to appoint this Commission, and the obvious course to pursue was simply, until this Commission had reported, to do what could be done, given a good monsoon, not to allow any further rise to take place. No action has been taken to prevent a fall because the opportunity for any such action has not arisen. If members would turn to the figures given in the tables in the memorandum, Appendix XI, on the history of the Indian currency system, it will be seen that in September and October, 1924, an enormous amount of sterling was purchased for rupees. On the 9th October, for example, over £2 million were purchased on one day and £2 million were purchased the day before. It is obvious that there was a tremendous demand at that moment which had to be satisfied, and that if it had not been satisfied, there would have been very undesirable speculation in exchange by those who had to lay down rupees during the winter. Something similar occurred this year in September. You will see that on the 29th August we had purchased over £2 million and on the 14th September over a million pounds. At that moment, owing to some feeling of uncertainty as to what the intentions of Government might be, there were the beginnings of an anticipatory rush to lay down rupees in India, which was, as a matter of fact, checked by a statement made by me in answer to a question by Sir Purshotamdas Thakurdas in the Assembly that the present policy of the Government of India was to try and prevent a rise above 1s. 6$\frac{3}{16}$d. We had to take some action, when exchange reached a certain limit, and it was the course of other events rather than any decision of the Government of India that has made a particular rate the effective rate.

143. The exact figure was to a very large extent accident, except that it was 1s. 4d. gold?

144. (*Chairman.*) It was decided rather by external events than by the policy of the Government of India?—It was the moment for intervention because it showed signs of rising indefinitely—at that moment it was going to be just 1s. 4d. gold, the natural point to intervene because it was the pre-war rate. But as the history both of Indian prices and of exchange during last year shows, it is rather sterling than gold on which the rupee has hung.

145. (*Sir Reginald Mant.*) The decision, we may take it, was not based on the merits of the particular rate; it was merely decided to stop at the point that was reached at that moment for the time being. There is another question with regard

to the price of silver. The price of silver has not risen so much in comparison with pre-war prices as general commodities have, has it?—I am not quite sure what the figure was in 1914. It was 22d. or 23d. With 22d. or 23d. pre-war and with 34d. per standard ounce in London now it would be in parity with world prices.

146. The point is whether there is any danger of a permanent rise above the present level owing to the rise not having been so great as in the case of other commodities?—Generally, the demand for silver in the East is very much stimulated the moment it falls seriously below the average level of commodity prices. I should be the last person to claim any capacity to know as to what the price of silver is going to be, but I think it is likely that if it is below commodity prices, perhaps it will tend to move up a little bit.

147. (*Sir Henry Strakosch.*) Due to the fact that the bulk of the silver production is incidental to the production of other metals and that other metals have risen very substantially and their production has been stimulated, is not the supply of silver greater than would otherwise be the case?—I think the supply of silver since the war has been rather exceptionally large owing to the action of so many Governments in melting their old silver and substituting other coin with a lower silver content or coin of some other metal. But some of the countries which have been through the biggest difficulties might adopt a silver coin, which may mean a demand for silver. I understand that the Soviet Government gave or may give an order for silver coin to the British Mint; whether it was carried out or not I do not know.

148. (*Mr. Preston.*) The general world production of course is almost at its highest now, and present figures up to last month show very little set-back on what they were last year, which was almost a record. In so far as the stocks in China go, they are, I think, three times their normal. Really speaking, if you take the position of silver to-day, with large stocks in China pending political developments there, and with the position of the Continental Governments, which really do not permit of their spending money in acquiring silver for coinage, it does not look, on the face of it, as if you need anticipate a rise in silver?—I suppose it is true that the production of silver is high at the present moment, not because of the demand, but because of the high price of lead and zinc.

149. It is almost entirely a bye-product.—But really Mexico and the South American States, who have of late come very prominently into the picture as producers, they are all increasing their outturn, and of course you have also to look at the fact as to whether the rise of wages in America as against the pre-war basis would have any effect on silver prices.

150. (*Sir Henry Strakosch.*) I think I am correct in saying that the bulk of the silver produced is a bye-product. The bulk of the whole world's silver production is, I think, a bye-product of other metals and not originally mined for its own sale, and therefore, as long as the demand for the metals accompanying the silver is high, the chances seem to be that the production of silver will continue high.

151. (*Chairman.*) It looks, from what we have heard, as if there were balancing considerations affecting the silver market as a special market which rather confirms the answer Sir Basil has already given, calling attention to the fact that silver at present moves with the regular commodity market in that way. Are there any supplementary questions to ask upon this aspect of the subject?

152. (*Sir Purshotamdas Thakurdas.*) You say that the 1s. 6d. rate was the point which the Government of India selected at which to stop and that it coincided with 1s. 4d. gold?—It was just at the moment that exchange reached 1s. 6d. that the decision that it was essential to prevent for the time being the running away of the price was taken. Meanwhile the Government of India had to buy a very large amount of sterling and create a very considerable amount of additional currency to prevent it running above the 1s. 6d. sterling figure. It would have meant a very large addition to the Currency if we had taken at that stage 1s. 4d. gold in view of the great uncertainties that existed at that time as to what the future might be. What was wanted was some figure which the market would see as being for the time being the maximum and that figure was a sterling figure inevitably.

153. (*Chairman.*) Now, just a final question on this point, Sir Basil. We have now examined and analysed the relative advantages and disadvantages that will accrue from raising or lowering or maintaining the present rate for stabilisation of the rupee. In your memorandum on the Indian Currency System you assume an 18d. rate as the basis for discussion, and Mr. McWatters in his memorandum expresses finally a preference for the 18d. rate, that is, stabilisation at the present rate, and that in the event of stabilisation at a rate substantially higher or lower, re-adjustments would inevitably be necessary. Do you wish to express any preference for any one of the three alternatives as a result of the considerations which you have discussed to-day?—I quite agree with the memorandum of Mr. McWatters on this point; there appear to be distinct advantages in accepting the present position and retaining the 1s. 6d. rate.

154. And substantially for the reasons stated in that memorandum?—Yes. It is mainly a negative reason; that I see no argument at all, if I may put it as strongly as that, which would justify action being taken to introduce the further upsetting factor of a new rate of exchange into the present conditions.

155. (*Sir Reginald Mant.*) I wish to know if you anticipate any inconvenience in the 1s. 6d. rate not being readily changeable to the sovereign?—It involves of course a recurring decimal of $13{\cdot}\dot{3}$. It would be convenient to have some rate which made the rupee an exact multiple of the sovereign. But there is not very much in it; and if, to get on to totally different considerations, there is an intention to give any kind of gold coin in circulation in India, there are to my mind some advantages in having a rather larger unit than the sovereign because obviously you do not wish to encourage the indiscriminate circulation of gold for its own sake. Therefore a gold coin of somewhat higher value than now might actually be preferable. But it is inconvenient not to have a definite number of rupees going to the sovereign, and it does make it very difficult to say whether it would be desirable to have a sovereign in circulation in India at all and there seems to be some sentimental objection on general Imperial grounds to not having the sovereign legal tender.

156. Are there not two considerations? Firstly, the conversion of sterling into rupees for the accounts in India and secondly the exchanging of the actual sovereign for rupees?—For accounts purposes 1s. 6d. is not at all an inconvenient figure. It means that crore of rupees is £750,000—Rs. 40 for £3 or Rs. 80 for £6. It is quite a convenient figure. Rs. 1,000 for £75. It is not really a troublesome figure to work with.

157. You cannot suggest any other convenient figure in the neighbourhood of 1s. 6d.?—I have myself often thought about it. There is no doubt that 1s. 8d. and 1s. 4d. are more convenient figures than 1s. 6d. But I do not think there is any fraction between 1s. 6d. and 1s. 8d. or 1s. 4d. which gives you a convenient figure.

158. Thirteen rupees to the pound would be an inconvenient figure, besides being unlucky?—I do not think it would be necessarily unlucky. But it involves an extremely awkward fraction—in terms of pence.

159. There is really no convenient figure between 1s. 4d. and 1s. 8d. for that purpose?—No. At the same time for purposes other than coinage 1s. 6d. is not particularly inconvenient. It is almost an impossible figure from the point of view of a sovereign in circulation, but for account purposes would be all

right: a guinea would be just right as a matter of fact.

160. (*Chairman.*) Sir Basil, we have had the advantage of going through your note on the Indian Currency System, also Mr. Denning's note on A Gold Standard policy for India and also a supplementary note written by him on the Transfer of the management of the Paper currency to the Imperial Bank of India. These notes cover a good deal of ground regarding the elementary aspects of the question of the currency policy of India and will save us a good deal of trouble; so that using your note in particular on the Indian Currency System as a basis for questioning I will come straight to the questions which seem to need further elucidation and discussion. The general basis of your note is the analysis of the possibilities of three main alternatives. The three alternatives are a sterling exchange standard, a gold exchange standard and a gold standard. There is one feature common to all the three systems which it might perhaps be most convenient to take first, and that is that under any system you believe it possible to transfer the right of note issue and the management of the paper currency to the Imperial Bank. Let me ask you then, in the first place, what in your opinion would be the advantages of such a transfer and what the disadvantages, if any?—Nothing in the nature of a Central Bank or State Bank for India existed until 1920 and therefore this question of transfer is a new one that has not been before any previous Commission or Committee. But there was before the Chamberlain Commission a proposal that a recommendation should be made for the establishment of a State Bank with a view to improve the currency and financial situation in India; and I think it may not be unfairly said, that, when the Imperial Bank was created, one of the purposes was at any rate the possibility, of the transfer to it of the management of the paper currency. It was a defect of the Indian financial system before the Imperial Bank was created that the Government kept a large portion of its funds in separate treasuries quite away from the banking system of India as a whole, and the creation of the Imperial Bank has enabled a concentration of Government balances in the hands of the Imperial Bank, but perhaps in doing so has drawn into even clearer perspective the divorce between the control of the discount and general monetary policy of India and the control of the issue of the paper currency and of the exchange. The chief advantages to be derived from the management of the note issue by the Imperial Bank are set out in Mr. Denning's memorandum and I think I would endorse them as they stand. Currency and Banking reserves would be under the control of the same authority, the money market could be regulated more effectively and in particular the wide fluctuations in money rates due to seasonal demands for currency, one would hope, could be moderated. That is the main purpose and that is the main advantage. Then there are the further advantages enumerated in (*b*) and (*c*) of this memorandum. The responsibility of Government officials for banking business would be a great deal reduced; and although the Government could not entirely divorce themselves from some control of policy, the day to day management of the monetary resources of the country would be conducted by Bankers and Businessmen with an eye solely to the commercial interests of the country. There would be less danger of high political motives influencing the Banking and Currency Policy of the country in a wrong direction and there would be what is still more important perhaps less inclination or reason to attribute such motives, where they did not exist.

161. Does that complete the tale of Mr. Denning's arguments?—Yes.

162. Taking the first of your advantages, that the concentration of control of currency and credit in one hand is better for the control of the money market and for the avoidance of seasonal fluctuations, will you explain how the transfer of control of currency to the Imperial Bank achieves these results?—The whole of the banking and currency reserves would under the system imagined be under the control of the Imperial Bank; when it found that the market was tight, it would be in a position to create additional currency against either sterling securities or it might be rupee securities and if there was automatic provision that it had to buy sterling without limit at the upper gold point and sell it without limit at the lower gold point, it would be absolutely essential that it should be in control of the resources for doing so.

163. That relates rather to its operations in the exchange market?—Yes, but the internal conditions and the tightness or otherwise of the internal market are nearly always reflected in the conditions of the exchange and there would be no room for the conflict of interests which might arise theoretically at present, as regards the position of Government balances, and their desire to strengthen them by remittance against paper currency, when they had to remit, rather than against their own balances. The only question that would arise with the Imperial Bank would be whether or not it was desirable to allow the currency to increase or whether they should put up the bank rate with a view to controlling the tendency for prices to run away.

164. Putting it generally, concentration of resources in a single hand tends to mobilise them for the purpose of supplying credit, increasing or limiting the supply according to the needs of the market?—I think that it is a fair general way of putting it. There is the internal condition and the external condition which would have to be taken into account together, and there has been a divorce to some extent between the two points of view. Under the new system the Banking and Currency resources would be both freely available to meet both internal and external strain. As things are at present the currency resources are only to a very limited extent available for the purposes of internal strain.

165. You say that the currency reserves are available only to a limited extent?—Those in the gold standard reserve are hardly available at all.

166. The gold standard reserve is not available for internal strain and the currency reserve may not be as available as it might be for external strain?—Or even for an internal strain. If you have a run on a Bank, for example, it means a big demand for currency at a given moment; if the Imperial Bank is in control of the Currency reserves it can regulate its policy with regard to currency with reference to that internal strain. At present, at any rate, you have to get an agreement between the Government and the Bank before the currency policy is directly related to the Bank's internal policy at all.

167. There are really two circumstances to which you refer, as tending to demobilise reserves at present, first, separation of the reserves into two, and, second, the divorcement as to their control from the power which is really not in direct contact with the money market?—There is of course a direct contact between the two, in the fact that the Controller of Currency is an *ex-officio* member of the Central Board of the Bank, but that is only a partial marriage of the two —the Imperial Bank and the Government. It is not a transfer to the Imperial Bank of any of the Government's powers in relation to the currency reserve.

168. So that you are assuming the transfer of management of the reserves to the Imperial Bank, and the unification of the two reserves?—I should like to see that done: I am assuming that at any rate a considerable proportion of the functions which are divided now between the paper currency reserve and the gold standard reserve are thrown on the side of the paper currency reserve and if anything is left for the gold standard reserve, it would be strictly confined to its purpose. But I should like to go beyond that and amalgamate the two altogether. In the memorandum on a Gold Standard for India I think it is assumed that it is impossible or at any rate that it is very difficult to amalgamate the two altogether.

the combined reserves and of the note-issue to a Central Bank. Has any member any supplementary question to ask on this point?

188. (*Mr. Preston.*) To come back to the statement you made a little while ago when India obtained a gold exchange standard in September, 1899, and sovereigns and half sovereigns became legal tender, it was then almost a recognised policy that the gold which was held in the paper currency reserve should always be looked upon as the first line of defence in case of a failure of exchange value and later on with regard to the gold standard reserve which first came into being about 1901 as [illegible] of the profits on coinage in 1900 from that [illegible] till certainly the outbreak of the war it [illegible]s a recognised thing that that Reserve was a specialised reserve for a special purpose and in all the previous Commissions' Reports it has been so looked upon and I do not think they have in any one case even suggested any tampering whatever with that reserve from the original purpose for which it was formed. Do you agree with that?—There has been considerable fluctuation I think in the policy as regards such things as the amount of gold to be kept in the gold standard reserve or the paper currency reserve respectively—the question whether the gold standard reserve should consist largely of gold or whether the gold should be largely in the paper currency reserve. I think I am right in saying that the Chamberlain Commission recommended the holding of gold in the gold standard reserve and the Babington-Smith Committee reversed that recommendation and held that the gold should be kept in the paper currency reserve. If there has been a recognised policy I do not think that it has been absolutely unchanging, and I am not sure that I shall be greatly impressed if it had.

189. Your memory won't then go back to the American crisis of 1907-08?—Yes, I remember it very well.

190. I do not think you were actually on the spot? —I was in the British Treasury at the time.

191. A very great amount of correspondence took place between the Government and the Bengal Chamber of Commerce at that time; many letters passed, and these two points were very strongly emphasised, and I think I am correct when I say that the Government of India fully recognised in the strictest sense that the gold standard reserve was there for the particular purpose for which it had been created and that under no circumstances would they permit it to be utilised for any other purpose?—Was that with reference to a recommendation that had just been made by a Committee presided over by Sir James Mackay before he was Lord Inchcape? I think they recommended the utilisation of some of the gold standard reserve for the purpose of capital expenditure on Railways.

192. No. It was much previous to that. The Government of India took about a million and odd out for railway purposes from the gold standard reserve and the Chambers of Commerce at the time drew their attention to this and that was replaced subsequently as a result of these representations?—Yes.

193. Because as we pointed out to them—I personally was at that time the Chairman of the Finance Committee of the Bengal Chamber of Commerce and therefore I was conversant to a great degree with all the literature which passed between us on this particular subject and I can say without any measure of doubt whatever that there was never any hesitancy of any kind or shape in the minds of the Government people as to what the purposes of that particular reserve were?—Possibly both the Government and the Bengal Chamber have learnt something since then from the lessons of the last seventeen years.

194. I don't think so. I do not think that alters the position in any way whatever. Your memory does not carry you back to that date?—I remember it fairly well, because as the Secretary to the Chamberlain Commission, I had to read through all the correspondence that took place.

195. Assuming as it looks to me from this that you wish to make use of the £40 millions in the gold standard [illegible], does not that in a manner amount t[illegible] confiscation of the money in that reserve?—I [illegible] say a useful application of that money, not confiscation.

196. I repeat it. Would you consider that not as a confiscation of that reserve?—I should certainly not regard it as confiscation.

197. You are taking it for practically Revenue purposes?—I am taking it from where I regard some of it as superfluous for a purpose which is urgently desirable.

198. That is, for a revenue purpose?—For a capital purpose. If you prefer to say so, we have been taking it for revenue purposes for the last four years.

199. That is the interest on it?—Yes.

200. But not the capital—not yet?—There is no serious difference between interest and capital in this case.

201. You have taken the interest on the capital but you have not touched the capital as yet. You are taking it or you contemplate taking it for revenue purposes?—Perhaps the simplest answer to that is that I believe having regard to the general position of the Indian Currency that the amount in the gold standard reserve at present of £40 millions is unnecessarily large under the present currency system.

202. I merely want you to give me an answer to that so that we can emphasise it: because there is a very big consensus of opinion strongly in favour of retaining that reserve at any price?—I do hold that it is unnecessarily large and that it is certainly unfair to the people of India to accumulate a reserve at their expense beyond that amount which is required.

203. Then with regard to the handing over of the note-issue, would you consider, in so far as the present position of the Presidency Banks is concerned to-day, that they have got thrown upon them physically a mission that it is almost impossible for them to undertake further duties beyond what you impose on them?—Undoubtedly the Imperial Bank have had some very important functions to perform since they were created and have, I think, performed them admirably. The difficulty of taking on new functions would be to some extent a question of staff. I think that particular difficulty, for example, might probably be fairly easily got over by a considerable transfer of personnel from the existing Currency Department to the Imperial Bank. But I should not regard it as beyond the capacity of the Central Board or the Local Boards and the Managing Governors of the Imperial Bank to take on new duties.

204. Of course the new duties in connection with the Paper Currency Reserve and the Council Bill transactions would be very heavy?—They would be heavy. I am not sure they would be very heavy. The management of the Currency, so far as internal purposes is concerned, though it involves many important duties, has become to a considerable extent mechanicalised. So far as purchasing of exchange is concerned they have in fact been purchasing exchange, as agents of the Government, regularly for the last two and a half years. The main new function imposed on them is the function of control and for that they need adequate staff at the top. But I am not sure it is otherwise a great difficulty.

205. Then having in view the changing quantity of the Governors and their Local Boards and the difficulty which they experience in getting an efficient staff would you think that that would militate in any way against this contemplated move?—Naturally the transition would have to be effected carefully and not too suddenly. But I believe that it will be entirely within their power to undertake

169. Do you agree with that?—I am inclined to think after further consideration that you can get over that difficulty by some such device as I have suggested of taking the figure of fifty crores as among the liabilities of the new Amalgamated Currency Reserve as its liability in respect of the over-valuation of the rupee and the maintenance of a sterling value of the silver rupee and then after that simply providing that for every four rupees issued one rupee has to be covered.

170. It is an arbitrary device?—Yes, but it is suggested with a view to avoiding the separation of the two reserves.

171. There are one or two questions which I would like to ask you on behalf of Prof. Coyajee. Is not the simplicity resulting from such an amalgamation more than counterbalanced by confusing two reserves each of which is constituted for a different purpose and object?—If they were constituted for different purposes and objects, no one has ever been clear I think as to the limits and the line of demarcation between those two purposes. Strictly speaking, the paper currency reserve originally existed solely for the purpose of making paper currency convertible into silver rupees, and in a sense that is its only natural function. It had no original function to maintain the exchange value of the rupee which was, when it was originally constituted, determined solely by the ratio of silver prices to gold prices. It is an excrescence on the purpose of the paper currency reserve to have it made responsible for maintaining the exchange value of the over-valued rupee. I do not think that the present system is really very simple and there is the further difficulty that the amount to be held in the gold standard reserve itself has never been defined. Various estimates have been given at various times as to what the maximum is: but no one I think has ever definitely laid down the maximum figure nor have the purposes of the gold standard reserve ever been formally defined before the public.

172. You are inclined to think there would be greater simplicity in the amalgamation than in the present arrangements?—That is my view.

173. Secondly, Prof. Coyajee asks: would not the object, i.e., in relation to the automatic contraction of the currency reserve, be equally well secured by statutory recognition of the gold standard reserve as regards the time and measure of utilization?—I think it would be possible if you had statutory regulation for the gold standard reserve to secure automatic working.

174. Would it be possible to devise such regulations?—Yes.

175. Finally Prof. Coyajee asks: Has any other country with a gold exchange standard ventured to mix up its gold standard reserve and paper currency reserve?—I am not sure; I am not aware of any other country that has got a gold standard reserve.

176. (*Prof. Coyajee.*) France?

177. (*Chairman.*) No comparable instance occurs to you which will be a useful analogy?—I think you have many more analogies for a single currency reserve than there are for a system containing two separate reserves. There are many systems on the continent of Europe which are very much like the Indian system, where they keep only one reserve.

178. (*Sir Henry Strakosch.*) Would not the French system bear analogy to the Indian system?—Because in France under the Latin Convention Silver five-franc pieces and gold are legal tender. The controlling authorities have the right to pay either the one or the other.—But so far as I know almost the only system where silver and notes and gold are equally legal tender is in France and there they have got only one Reserve centralised in the Bank of France.

179. (*Prof. Coyajee.*) That is true but then they did not have a responsibility for converting silver into gold for export or any such thing?—Silver is an unimportant item in the total circulation in France, but *pro tanto* the same problems arise in France as in India.

180. (*Chairman.*) The second advantage you refer to is the advantage of transfer of control—shall I put it crudely—from Government officials to Bankers?—Yes.

181. Might it not be said that were you to make the standard more completely automatic than it has been in the past by methods suggested in your memorandum that that would diminish any disadvantages there might be in the control of currency management by non-officials?—It may; but at the same time the more automatic the currency system becomes the more importance attaches to the discount policy and that is essentially a function of the Bank.

182. What is the function of the bank now and would remain so?—The most important function would then be the discount policy. The assumption is that the currency system would be so automatic that any action with reference to currency would rest with the bank, and that there would be no reason for the Government to intervene in the operations of the bank.

183. I fear that is an optimistic assumption to make in regard to any currency system. At any rate by increasing the efficiency of the automatic factors in the system, thus reducing the necessity for the personal element, the arguments in favour of transfer to a bank from Government might be reduced to a minimum?—I think in the absence of an automatic system transfer is rather difficult. You want more Government control than if you have got an automatic system. It is more difficult to hand over to the Bank the control of a system which is not automatic than the control of a system which is automatic. If you are improving your system to the extent of making it automatic, there seem to be good arguments for improving it also at the same time by securing unified control of the banking and currency reserves. You probably cannot do it unless you make the system automatic.

184. Again it might be said that, in a highly developed banking country, such unity of control of currency and credit is essential, but it should not be regarded as of so much importance in India, where the banking system is less highly developed, where the use of banker's money and banking credit is of less proportionate importance to the finances of the country. Do you attach any importance to that contention?—I think I would agree with that as a statement of fact. But I would counter it by saying that one of the urgently desirable things in the Indian monetary system is to encourage the development and extension of banking habits, and investment habits, and to facilitate the working of the monetary machine in general; and that you are more likely to secure that object by giving the Imperial Bank control of the Currency than if you retain it with the Government.

185. On the question of popular confidence, is it in your opinion a matter at all to be considered of the relative confidence that would be inspired in a note-issue controlled by an Imperial Bank or Central Bank as compared with a note-issue issued and controlled directly by the Central Government?—I have done my best to get opinions from people as to the effects of a change of system under which the Imperial Bank's name appeared on the currency note in place of the Government's. It is a matter on which it is hard to express a decided opinion but so far as I can make out it is generally thought that it would make no difference at all to the credit of the note.

186. It will have no adverse effect upon the circulation of the note?—So far as the inquiries that I have made go I have not heard the suggestion often made that there would be any material difficulty in getting the note accepted whether it was a Government note or a Bank note.

187. (*Chairman.*) You have dealt with the general arguments in favour of or against (*a*) combining the two reserves and (*b*) transferring the control of

these duties and there is no very enormous difficutly in that proposal from that point of view.

206. You recognise that there is a great difficulty in the changing personnel of the Local Boards and also the difficulty of obtaining the staff required?—So far as the position of the Local Boards is concerned, it might be possible to improve the rules in regard to their composition and thus get over some of these difficulties. But my answer to the whole is that difficulties in any transfer of this sort must always be recognised, but I do not believe that they would be great.

207. Would you consider it would be preferable to transfer these duties to the Imperial Bank, as it stands constituted to-day or to a newly constituted Currency Board?

208. (*Chairman.*) By a Currency Board do you mean an official Board?

209. (*Mr. Preston.*) A semi-official and semi-commercial Board—the Board to be constituted on agreed terms, which would exist for the sole purpose of controlling the Currency and Council Bills?—Entirely independent of the Central Bank?

210. Entirely?—And independent of the Government?

211. Yes?—I have not thought that suggestion out at all. I do not think I have seen it made in that form before, I imagine it would be as bad a system as you could invent.

212. (*Chairman.*) What would be your reasons against such a Board?—It would be a third body between the Government and the Central Bank and unless it was merely the Central Bank and the Government working together under an assumed name, I think it will he bound to come into conflict with both very quickly.

213. (*Mr. Preston.*) My object in suggesting a Central Currency Board is for a dual purpose. In the first case you have told us that as from the Government point of view you would like to be relieved of a lot of the heavy duties connected with the Paper Currency Reserve and the Council Bill work.

214. (*Chairman.*) I rather gather from Sir Basil's statement that his opinion is based not so much upon the volume of the duties as their nature.

215. (*Mr. Preston.*) Equally so. When these duties are transferred to the Presidency Bank you would there meet with an equal amount of political trouble that you on your part as from the Government desire to be relieved of, and, if you had this separate Central Currency Board they would be subject to Government supervision, they would be free from any political intrigue, if I may be pardoned for using the term, to which perhaps a Bank might be subject, and they would work freely on those two points: they would relieve Government of all their worries and they would give a free hand to the Presidency Bank to carry on the great and important mission on which they have now started and which to my mind seems will tax the energies of the Governors, and their Local Boards for many many years to come. Would you agree to that view?—No. I am afraid I must say emphatically that I should not. This Currency Board would either be the Government under another name—if it is to be responsible to the Government, Government presumably will have to answer for its policy. In that case, I think you have merely created some new functionaries without altering the present position at all. If it is really independent, I imagine the last thing a Government could do would be to hand over to an Independent Currency Board uncontrolled and independent of the Imperial Bank complete responsibility for a matter of this sort and the Imperial Bank would have to be in very close touch with this Currency Board if it was to be in a position to carry out its duties in regard to the discount market and so on. If the Board was merely a Board to print notes and so on, issue them on somebody else's orders, it would surely be the currency department under some other name. If it is anything more than that, I think it is bound to lead to considerable friction without, so far as I can see, serving any useful purpose.

216. Supposing a Central Currency Board were constituted and the members of the Board were composed of certain members selected by the Government, representatives of, say, the Governors of the Presidency Banks and representatives of the Chambers of Commerce who would be elected and they take over the whole of the duties, would you have any objection to it under those circumstances?—I am afraid, the idea does not appeal to me at all. That is, I think, the general answer that I must give. I do not see its objects and I can see many possible disadvantages which would lead to a very rapid breakdown of any such Board.

217. In the event of any of the duties which would be assumed by the Presidency Banks in connection with the taking over of the paper currency reserve and the Council Bill transactions Government would be solely responsible in the event of trouble of any kind?—Government cannot get rid of some responsibility, some liablity for control and I think, if I may suggest, what you have in mind arises, if my suggestion for the transfer of the control to the Imperial Bank were followed up, on the question whether some change in the constitution of the Imperial Bank might not be necessary to assist the transfer.

218. (*Chairman.*) Let us deal with the question of the change in the constitution of the Imperial Bank under a fresh heading. I have attempted to follow your attitude towards the suggestion of a Currency Board, Sir Basil: it is that you recommend the transfer of the control in order to effect a closer marriage between the credit and currency control, and in your opinion the institution of a Currency Board would increase the divorcement?—Yes.

219. (*Sir Reginald Mant.*) You observe that the combination of reserves is one of the advantages of transferring the currency to the Bank. Would it not be possible to combine the two reserves while retaining the Government management?—Yes: If I did refer to it as one of the advantages of transfer to the Bank, what I meant to say was an advantage of some newly devised system which would include transfer to the Bank. I think it will be quite possible to amalgamate the two reserves somewhat on the lines suggested in this note without the Imperial Bank being asked to take over the management of the currency.

220. And it would also be possible to introduce considerably more elasticity in the expansion and contraction of currency without transfer to the Bank?—Yes; transfer to the Bank, I think, is quite a separate subject.

221. It sounded as if you were giving some of the advantages of the transfer and it struck me that these two objects could be effected irrespective of this question?—Perhaps I may put it that the ideal that I should be aiming at would be complete unification of the control of currency and credit and that for that purpose transfer of the control of the currency to the Imperial Bank is suggested and similarly for that purpose, amalgamation of the two reserves. But I agree that the two can be considered quite separately.

222. You could have amalgamation and you could have a considerable increase in elasticity?—Certainly. You could effect both objects. What you would not effect would he the unification of control of currency and credit policy. In Mr. Denning's memorandum on the transfer of management of the Paper Currency to the Imperial Bank and in his memorandum on Gold Standard, he assumes only a partial amalgamation of the gold standard reserve and the paper currency reserve. He assumes a partial amalgamation of the two reserves and the creation of a new reserve under a new name, namely, a reserve for the redemption of rupees, which would be constituted out of part of the existing assets of the gold standard reserve. The proposal for the amalgamation of the two reserves is an additional proposal in my memorandum on the Indian Currency System.

223. (*Chairman.*) I should like next to ask a question on a topic which was raised in Mr. Preston's question and it is this. Would any change in the constitution of the Imperial Bank be advisable as a condition of the transfer? It occurs to me it is a question that you might prefer to answer at a later period of the discussion when we have gone more deeply into the question of the alternative standards and how they would work out?—I think that question might come more conveniently later.

224. And the consequential question as to the method by which the Bank would pay for the privilege of note-issue?—That is of course to some extent dependent on the particular system adopted though it is to some extent independent. But it does raise the question of the reconstitution of the Bank because one possible method would undoubtedly be to make the Government in some form or other a shareholder in the Bank.

225. We have dealt with one extremely important heading, which is as it were common to all the three proposed systems. Proceeding I shall next refer to the existing system and ask you what its defects are. It seems to be a logical consequence that before we discuss what the remedies should be we must see what the evils are that have to be remedied. I take it, then, that the chief defects in the present currency system are those set out in para. 2 of Mr. Denning's memorandum at (*a*), (*b*), (*c*), (*d*), and (*e*)?—Yes.

226. The first is 'the maintenance of the system was dependent on the price of silver remaining at such a figure that the bullion value of the rupee was not higher than its exchange value'. It is necessary to anticipate to a small extent here, because it is proposed in your memoranda and the other memoranda that that might be eliminated by limiting the tender of the rupee. Now I should like to clear the ground. To what extent, in your opinion, could this defect in the existing system be eliminated by limiting the legal tender of the rupee? Would it be wholly eliminated?—Not absolutely, but very nearly entirely eliminated, I think. Instead of being in the position that India was in 1917-18 that almost inevitably the exchange value of the rupee had to go up as its bullion value went up, you would be in the position that, for example, France or the United Kingdom were in 1919 and 1920 when, for a short time in England and perhaps permanently in France, the value of the silver in the subsidiary coin the shilling in England and the franc in France went above its value as currency. You had there very similar difficulties to deal with, namely, that your subsidiary coin was liable to go out of circulation and you had to provide some substitute. When it is unlimited legal tender as it was in India during the war, the only alternatives were to go on to a completely inconvertible paper basis or to attempt to recoin your rupee or to let your exchange value go up. If the rupee was simply a subsidiary coin, you could probably very quickly provide some substitute. For instance, there would be no objection to the one-rupee note almost completely taking the place of the silver rupee in such circumstances at any rate while you are engaged in the process of recoining; it is a very different thing in a period of difficulty to recoin a subsidiary silver coin which has only limited legal tender value and to attempt to go entirely on a paper basis.

227. Would you agree that, whether the rupee is legal tender or not, if its bullion value rises above its face value there is the same inducement to melt it down?—Yes.

228. Do I understand that your opinion is that if it were not unlimited legal tender, it would be possible to overcome such a position by substituting either small notes or a debased rupee—a rupee with a reduced silver content than the existing rupee?—Yes.

229. What is the aspect of that possibility? Would it create any less convulsion in the popular estimation of the coinage?—I think you have got to look forward and my assumption is that before you make the silver rupee limited legal tender only, you have to provide complete convertibility of your currency into a full value gold coin. That is the assumption. If you have done that the rupee becomes comparatively an unimportant factor in your external currency policy. It may remain to very nearly the same extent in actual circulation as at present. But you are not going on to an inconvertible basis. You are simply changing the form of your subsidiary medium of circulation, which surely is a very much easier thing to do if both the old and the new subsidiary coin are fully convertible into fully valued gold coin.

230. You are assuming that there has been a period during which the rupee has been convertible into gold?—Yes.

231. Are you assuming an indefinite continuance of that convertibility?—Yes.

232. Are you also making the further assumption that there has been a large substitution of rupees by gold in circulation?—It depends how you define circulation.

233. In my mind I was defining it as circulation as distinguished from hoarding?—I do not contemplate under a system such as I have suggested where the rupee is fully convertible into a gold coin, that there would necessarily be any large use of the gold coin for ordinary purposes of circulation. I do not think there would necessarily be any large reduction in the volume of transactions still carried out in rupees.

234. Then let me ask you, is it possible to form an estimate as to what amount of rupees would remain in circulation for the purpose of current transactions—what amount is required by the country for current transactions for which gold would not be used?—It is a very difficult figure to arrive at; but I think that an absolute minimum figure would be 150 crores, which is roughly rather less than Rs. 5 per head of the population. It might very likely be a larger figure.

235. Now let us compare that with the present figure for the circulating rupee—it is given somewhere in your memorandum?—You mean the rupees actually outstanding.

236. No. It is the figure which is so very much more doubtful, the rupees outstanding but which are not hoarded?—I have been talking to Mr. McWatters on this question and he is trying to prepare some more figures which he would give when he comes before the Commission, on this particular point. If I may, therefore, answer more generally I would like to leave it to him to reinforce what I say or give his answers after an attempt to study the figures more fully. We know that since 1835 when rupees were first coined—the figures are in the Report of the Controller of the Currency, 1924-25—Statement IX, pp. 58-59—there have been coined 647½ crores of rupees; that is the gross amount coined. We know that some of these issues have been redeemed practically in full. The 1835 issue of 26½ crores has been practically all called in. There was also an issue of a crore in 1911 which had to be called in—it was the first George Vth rupee and the elephant in one of the King's decorations was so like a pig that it had to be withdrawn. Then we have recoined a good many in place of worn coins. Mr. McWatters is giving more exact figures—but I believe that he brings the maximum that can be outstanding to something like 450 crores, without making any allowance for rupees that have been privately melted. That is where we get into complete doubt. Of course up to 1893, the silver coin was a full value silver coin and the cheapest way of obtaining silver very often was to melt the rupee. We know very large amounts have been from time to time melted in this way, so that you come down to a figure which is probably not as high as 350 crores and certainly does not exceed 400 crores for the maximum number of rupees now in existence—that is, hoards and circulation. I believe that another calculation based on figures in the annual census of rupees which is taken year by year and the results of which are tabulated in the Report of the Controller of the Currency, brings it to a figure of about 330 crores as the amount of rupees actully in existence at the present day. But it is obviously a very difficult figure to arrive at. I

think one may say with some degree of confidence that it does not exceed 400 crores and is probably nearer 300.

237. Is it possible to make any shot at the proportion in hoards?—If you take a minimum of Rs. 5 per head as the amount of rupees which are in real effective circulation and take off something for the Indian States which have got their own currency, 150 crores seems to be an absolute minimum for the amount in circulation in any circumstances and it is probably a higher figure—something nearer 200. That gives you a maximum figure for hoards of 200 and a minimum that may be not more than half of that.

238. So that when you were answering what I was asking you just now about your assumptions as regards the way in which a rise in the price of silver would affect the matter and could be dealt with, you took the figure of 150 crores as the amount of rupees which would then be remaining in circulation you were really assuming no substitution of gold for silver in active circulation?—I think one ought to add a figure of about 10 crores for the substitution. But I had ignored it as my figures were obviously not necessarily correct within 10 crores—it was hardly worth taking into consideration.

239. Let me put the question now from the knowledge we have gained. Supposing a rupee circulation of that order, what would be the social and political effect of the substitution of the silver rupee by a small currency note or by a rupee of reduced silver content, even though the rupee were no longer unlimited legal tender?—One would hope that it would be comparatively small if you had a period during which it had been recognised that the rupee was freely convertible into gold and if the new substituted medium of circulation were equally freely convertible into gold.

240. The uneducated populace, for instance, would be so much alive to the circumstance that gold was available that it would no longer be troubled by the status of the rupee?—One would hope that that would be the position. Obviously if the rise of silver took place within a short period after the removal of the legal tender character of the rupee, it would not be so easy to recoin as it would if it had been for 10 or 15 years or a generation in force. What I would be inclined to say is, it seems to me almost inconceivable that you can recoin the rupee or take away its unlimited legal tender character unless you have substituted some other metallic currency.

241. And as you very fairly say in your last answer, the people should be given time to get accustomed to the new possibility?—Yes: For a period of 20 years in the beginning, anyhow you will be subject to considerable difficulties if you had a rise in the price of silver. That is, I assume a period of 10 years for the introduction of the system and another 10 to 20 years for people to be thoroughly accustomed to it. Afterwards it will be possible to treat the rupee with the same contumely as the shilling.

242. There are many passages in previous reports which refer to the deeply ingrained habits amongst the ryots and the uneducated people, who regard silver as the ultimate basis of all currency. Has there been any change in that habit in recent years?—We had of course the rupee note in circulation, and in some parts of India it was very freely accepted and indeed there have been complaints from a good many different quarters at our action in withdrawing it; that action had nothing to do with its unpopularity but it was solely with reference to the comparative cost of the rupee note and the rupee, because we found it was more expensive on the whole—at any rate for some time to come, while we had a large amount of surplus rupees in hand—to give the public a rupee note than a silver rupee.

242A. Was that because of the very short life of the note?—Partly because of that and partly because the note had been printed to a large extent bound up in little books of 25 which people would carry about in a convenient form, with the result that the use of our five-and ten-rupee notes was interfered with considerably. I think the Report of the Controller of the Currency has some interesting figures on the point. The average life, from the time of issue to the time of cancellation, of the one-rupee note was 8 months in 1924-25 and 9 months in the two previous years. Five-rupee notes had a 13 and 14 months' life—but the general result was that it was an expensive note to keep in circulation.

243. In your opinion the free acceptance of the one-rupee note shows that the uneducated public is beginning to be educated beyond the rupee?—I think the war has educated the public in India as elsewhere to vagaries in currency which might have been thought impossible before the war. I may add that it is obvious that the last answer of mine does throw some doubt on the statement that it is out of the question ever to recoin the rupee unless you give some other metallic coin in its place.

244. That argument might be pressed in any direction to show that it is unnecessary to give additional encouragement in that respect?—I still believe it to be for practical purposes out of the question but I draw attention to the fact that that argument can be pressed.

245. I presume you would agree that the process of inducing the people to use more scientific forms of currency instead of the rupee is a process that will be greatly accelerated by the substitution of gold currency?—That is certainly my view, my conviction.

246. Another group of defects in the present system is referred to in Mr. Denning's analysis, which consists in the absence of any automatic stabilization of the rupee or the absence of any provision for automatic contraction of currency. I understand that in your opinion these defects are equally remediable by any of these three possible currency systems referred to in your memorandum, i.e., the sterling exchange standard, the gold exchange standard and the gold standard?—The only reason why the State is not able to undertake absolute liability automatically to give foreign sterling for rupees and rupees for sterling has been the size of the reserves. There ought to be no serious difficulty, if the reserves are adequate, in taking absolute liability to make the rupee exchangeable into international currency within the gold points.

247. And that remedy is substantially the same under any of the three systems?—I should hope that the Commission would recommend action on these lines whatever system they adopt.

248. I take it that as long as the gold standard reserve exists without the provision of any definite relation between the size of that reserve and the amount of currency outstanding, there could be no automatic contraction of currency?—I see no reason why the mere existence of a gold standard reserve should interfere in the matter of the automatic contraction of currency. I do not think so much of the absence of a relation between the size of the reserve and the amount outstanding in the absence of any absolute rule that sterling must be given for rupees or rupees for sterling at fixed points and that the currency must be expanded or contracted perfectly automatically as that happens. The gold standard reserve could well be used in that way only, subject to the assumption that its amount is adequate to meet all needs. But at present it can be also be used to borrow from instead of simply to withdraw from, and if you borrow from it, you can of course increase your capacity to meet sterling without making any contraction in your circulation, as long as it lasts. That is of course, as I pointed out this morning, where the effort to introduce the two shillings rate broke down. A stage was reached where it was felt to be too dangerous from the point of view of contraction of credit in India, and I imagine from the point of view of the Government's budgetary position, to go on contracting the currency, so that the sterling assets were used to enable demands for sterling remittance to be made, but

no corresponding reduction was made in the rupee circulation. As long as that is possible, as long as that is done, you have not got a completely automatic system.

249. (*Mr. Preston.*) With regard to the extent you have just mentioned of the gold standard reserves, is not that more dependent upon what unfulfilled balance of trade of India is outstanding at any one time?—The size of the gold standard reserve I think has got to be taken in relation also to the size and composition of the paper currency reserve. The amount that you require is the amount that is required to meet the maximum possible demand to take rupees or notes out of circulation in India and give sterling exchange in place of it. There are two limiting factors: the amount to which rupees can afford to come out of circulation is limited, otherwise you will have such a contraction of credit that people cannot afford to buy sterling. Assuming that we have had, as happened some years ago, two bad seasons, or three, the question how far a gold standard reserve of 40 million would go—or say three bad seasons taking an outside limit—that of course depends very much on world conditions.

250. You have referred to a gold standard reserve of £40 million?—I should prefer to say that we have got sterling assets apart from the balances with the Secretary of State of I think 109 crores, which is a very much bigger figure. I do not think you can take the demand in relation to the gold standard reserve alone; it must be in relation to your total sterling.

251. (*Sir Henry Strakosch.*) Is it not a fact that if there were a succession of bad seasons, the mere fact that the seasons of the previous years were bad would automatically contract import into this country and therefore the need for sterling remittances?—That is so to a certain extent. Of course it may happen and it happened in 1920-21 in particular that there is a boom and very large imports are ordered in advance. You then have a change of conditions, a bad monsoon or something corresponding to a failure of exports and at the same moment the imports previously ordered coming in to be paid for. That is the moment at which the strain on your reserves is likely to be the greatest. When you have got over that, the effect of the failure of crops must mean a very large reduction in the capacity of the people to order goods from abroad and a big reduction in imports, and the strain is not anything like what it would be at the first period after the change from booming conditions to something in the nature of a failure of crops. You have, however, to allow for the Government's large external liabilities also. I have not worked out the exact figures on this particular question, and I have asked Mr. McWatters to be prepared with figures as regards what have been historically the largest demands on the reserves at a time of trouble. The position in the years 1907-08 and 1909 is set out at very considerable length in the Chamberlain Commission's Report and in the Appendices and I believe there are some figures in the Appendices to the Babington-Smith Committee's Report which give the same general results. If you consider both the possible maximum demand for sterling and the possible extent of contraction that the market in India will stand, it seems to me that even 40 million is a pretty large figure for any particular demand.

252. In fact the upper limit of sterling reserve is the amount by which you can contract the circulation in the country or rather the point at which further contraction of the currency in the country would cause a greater damage than the abandonment of the gold points in the exchange?—Of course one has to assume also the capacity to borrow in London in times of difficulty. The object of one's reserves is to be able to rely on them. At the same time the Government of India is continually spending considerable sums in London or paid for through London and in times of difficulty it is quite legitimate that they should borrow some part of their capital expenditure in London even to an extent more than the amount they are actually spending in sterling at the moment.

253. Would you consider 110 crores as the maximum by which you can contract circulation in India?—I should regard it as a wild over-statement of any contraction that the market could possibly stand.

254. What figure would you put it at?—It surely must depend very much on whether you have a large boom or increase in prices or the conditions of world prices may be bad—25 crores is perhaps a maximum, it is a very large contraction.

255. (*Sir Norcot Warren.*) I should say 10 crores. (*A Member.*) I would hesitate to go as low. Previous Commissions felt that you ought to have as much as the difference in two years' balance of trade.

256. (*Sir Henry Strakosch.*) Of course the contraction might be greater in a country where you have big hoards than in a country where money circulates purely as money?—I was speaking of contraction of the real circulation. The existence of the hoards is of course both a hidden danger and a hidden reserve against difficulties.

257. Would not they call for a greater exchange reserve?—Yes, at the same time they provide for the possibility of a considerable export of metal. But there is in addition the use in a time of trouble of the hoards of uncoined gold and silver; historically I believe it has been almost invariably found that in a time of bad monsoon ornaments are melted and come to the Bombay bazaar and find their way out either in reduction of new imports of silver or actually for exports of silver.

258. Did your figure of 25 crores contraction take into account what might come back from hoards?—No. I was giving what seemed to be an over-estimate, even at 25, of the amount of the contraction of the actual circulating medium that was possible.

259. (*Sir Purshotamdas Thakurdas.*) I think that you said earlier in your examination that the contraction which the Government of India effected after the Babington-Smith Committee Report till March, 1923, was 60 crores. I think this extended over a period of two to three years perhaps. And although that was after the war period when abnormal conditions with an immense inflation had taken place, I believe that you told us that you found it impossible to contract more than 60 crores till March, 1923?—I had not this in mind in giving this figure.

260. I mentioned the above wondering if it would help you to endorse the figure of 10 crores named by Sir Norcot Warren and discard the figure of 25 crores which you have just mentioned?—I believe that 25 crores would be a very large contraction.

261. After August, 1923, no further contraction of currency was found possible by Government?—That is so, or at least not desirable.

262. (*Sir Purshotamdas Thakurdas.*) Even after this abnormal period 60 crores in three years was found to be the limit to which the Government of India could go?

263. (*Sir Henry Strakosch.*) Were these years of good monsoon?

264. (*Sir Purshotamdas Thakurdas.*) Fairly good.

265. (*Sir Basil Blackett.*) You had a tremendous fall in world prices taking place, but even in spite of that contraction Indian prices fell considerably less than world prices. An automatic system would have required an even greater contraction.

266. (*Sir Reginald Mant.*) In Mr. Denning's memorandum he says that it is practically impossible to remedy defect (D) without taking away the full legal tender character of the rupee. I gather that you do not adhere to that view? In paragraph 5 he says it is practically impossible?—I am inclined to think that it is possible—that the amalgamation of the two reserves is quite possible quite independently.

267. If you had a system of automatic contraction, what would happen when you came to a situation such as you described in 1921 when the Government sold reverse councils and they could not contract the currency much because it would cause a stringency? If you had a system of automatic contraction, something would have to give way?—Yes; if Government has got itself into the position that it has a large Budget deficit and a large amount of floating debt maturing, it is almost inevitable that the full rigor of an automatic currency system must be modified, and a temporary departure from the standard is unavoidable. If you have conditions at all corresponding to those after the war, it only means that other considerations have induced the Government, justifiably or not according to the circumstances, to have regard to other desiderata rather than to the stability of exchange, as was done practically everywhere in the world during the war.

268. Apart from budget deficits, if you had a phenomenal fall in prices that in itself would rather break your system?—Any currency system, of course, is subject to considerable strain at the moment when a boom collapses, but unless you have abnormal circumstances, or there has been some failure of control of the credit policy, it ought to be possible to get through that period of panic without completely divorcing ourselves from our existing currency law. There is always, of course, the possibility of a suspension of the Bank Act in England. I contemplate that some similar provision would still exist in any currency system adopted in India, but it must be understood that if you want to have stability of exchange, the penalty of undue optimism in a period of boom is a period of very severe stringency afterwards.

269. (*Sir Henry Strakosch.*) Is not that the particular virtue of a Central Bank?—That is the very object of a Central Bank. It is the particular function of central banking to maintain the credit policy, to prevent any undue strain on the currency system; and of course it is the particular virtue of an automatic currency system that it results in undue speculation or optimism meeting with its own reward without the intervention of any other party who could be accused of being guilty of causing the trouble. That, I think, is one of the great objections to the Government controlling the currency system, that the trouble is caused as a natural result of the speculation or undue optimism in business circles, and the remedy is a contraction of the currency; but if Government are the agent for bringing it about, they are accused of causing the slump, and the accusation also is made that the boom was engineered by the Government. If, it will be said, the boom is not engineered by the Government, then it is said that the Government has brought the boom to an end wickedly for its own purposes, for example, because it does not like to see people making money. This is not peculiar to India. It is exactly the position that you have had after the restoration of the gold standard in England.

270. (*Chairman.*) I would like to refer to a matter mentioned by Sir Reginald Mant with reference to what Mr. Denning says in paragraph 5 of his memorandum about the difficulty of amalgamating the reserves. I understand that you are not so much impressed by that. In your view the relation would be not to the circumstances mentioned by Mr. Denning, but to the proportion of the rupee circulation returnable from circulation, from which it is possible to make a more certain estimate?—Yes. I think you can make a fair estimate; as the ideal size of the gold standard reserve really is unascertainable on exactly the same grounds, namely, the unascertainability of the liability that it is called upon to meet, you do not really add to the difficulties in any way of the problem by transferring the element of uncertainty from the gold standard reserve to the new amalgamated reserve.

271. In your view the circumstances to be taken into consideration in trying to estimate whether your reserve is adequate or not is not the difference between the token and the bullion value of the total circulation outstanding, but what amount of the currency in circulation it is possible to spare out of circulation, *i.e.*, the degree of contraction?—It is the degree of contraction. I do not mean that you can ignore hoards entirely. You do not need cover in the reserve for the whole of the rupees in circulation or in hoards, because they themselves carry part of their own cover. Nor do you need cover for every rupee in circulation or in hoards, because a very large proportion of them cannot in any reasonably conceivable circumstances be spared from the purpose that they are serving. The size of your cover is dependent upon the amount of rupees in circulation or hoards which you are likely, in the most extreme circumstances, to be called upon to meet.

272. Is it right, in considering the reserve necessary, to take into account at all the bullion value of rupees returned from circulation; because will not those rupees be required to be reissued into circulation with the recovery of trade?—That is one of the great difficulties of having an over-valued coin as your main medium of circulation and unlimited legal tender. If you have fully valued coin and it comes in, owing to redundancy, in times of trouble, the metal in it, if gold, at any rate, has an immediate world value which is not fluctuating. If you have an inconvertible note as your main medium of circulation, you have got the whole of your reserve against that centralised all the time; and as the note comes in, your reserve is realised and you can deal with it. But if you have got, as you have here, an inconvertible currency consisting ultimately of a note printed on silver, you have got only a proportion of your cover in reserve under your own control in the centre and the reserve that is carried about in the coin itself is of least value at the moment it comes back to you.

273. Why of least value?—Because if you want to sell it you immediately depress the price; it comes to you under circumstances in which the price of silver is likely to be low, and you would depress the prices further by using it, so that your natural desire is, if you can, to put the rupee by and not to use it at all for the purpose of meeting your external drain, and hope that circumstances will come later on when you will be able to reissue it. The result of that system, of course, is that we have at present over 90 crores of rupees in the paper currency reserve locked up. We have considerable difficulties in finding accommodation to keep them in and we are losing, of course, interest on the whole of the bullion value. There seems to be no particular likelihood that we shall be able to get rid of them, say, even within 10 years, and, of course, a large part of the cost of the suggestion for a gold standard is due to the existence of this large hoard of rupees locked up uselessly and the need for liquidating it.

274. (*Sir Norcot Warren.*) You stated that the maximum number of rupees now in existence—hoards and circulation—certainly does not exceed 400 crores. Do you include in that 400 crores the coins hoarded in Hyderabad, Gwalior, and other Indian States?—Yes; in so far as they are Government of India rupees. Some of the hoards are believed to be in gold. Some States, for example, Hyderabad, have their own rupees, and some only of the hoards are in Government of India rupees.

275. (*Prof. Coyajee.*) Two of the objections advanced against the old gold exchange standard, that is (*c*) and (*d*), seem to be capable of being remedied by statutory obligations. A statutory obligation might be imposed on Government to sell reverse councils—that the proceeds of such sales and of reverse councils being in rupees, should be locked up in the gold standard reserve. And that is automatic contraction?—Yes.

276. So these two objections may be made to disappear. Thirdly, if convertibility of the rupee into gold could be introduced with the increase of our

gold reserves, then the people might get what currency they like, and the standard is capable of being considerably strengthened by these obvious expedients?—Certainly.

277. Because in this memorandum whenever we read of methods to remedy the defects, it is proposed immediately to abolish it, to make the rupee a subsidiary coin and so forth. That would certainly be a radical change, is it not?—The only way of remedying defects due to the fact that the rupee is an over-valued silver coin of unlimited legal tender is obviously to take away the unlimited legal tender.

278. Would that be a gold exchange standard at all when the rupee is in the position of the shilling? If it is some subsidiary coin then the system could not be such?—We might conceivably have a gold exchange standard with the rupee as a subsidiary coin if for internal purposes the only unlimited legal tender is a currency note—inconvertible except into foreign exchange.

279. (*Mr. Preston.*) With regard to that expression " foreign exchange," could you tell us why it has been introduced into these suggestions? Hitherto the settlement always has been through London I think?—I have pointed out in my memorandum that the pre-war standard was only a gold exchange standard in the sense that sterling was regarded as equivalent to gold. If you still regard sterling as equal to gold—and, as I think, there are very strong reasons for doing so—there is possibly no need to draw a distinction between sterling and foreign exchange. But if it is to be theoretically a gold exchange standard it must, I think, carry within itself some provision for dealing with the abnormal moment when sterling and gold are not at parity.

280. What I want to get at is this. It seems to me, I may be wrong, but the use of this expression " foreign exchange " seems to convey to one's mind that there is some idea that as against notes tendered for exchange, funds in New York might be provided?—Or Amsterdam.

281. Why should India go to provide funds in New York or any other centre?—As you will observe that is not the form which I have blessed very much in my latest memorandum on the subject. But you cannot have a system that is proof against the eventuality of sterling failing to maintain parity with gold, unless there is some provision either that your rupee or note is convertible into gold, or some provision that if sterling is not gold your rupee is convertible into currency that is gold.

282. Would it not be better in our case to maintain what has always been the practice—to hold against the note or rupee, gold funds or gold to be given in London; so that if one wants foreign exchange, he can buy foreign exchange in London—but it will be no part of the duty of the Government of India or the Imperial Bank on whose shoulders such an obligation might be imposed to go to the extent of providing funds in America or Amsterdam or any of these outside world centres?—I do not suggest, so far as I am aware, nor has it been suggested, that it is a desirable proceeding, but it is merely stated that some provision of this sort is required if you are to meet the objection, theoretical if you like, that sterling and gold are not necessarily identical. At least, the experience of the last 10 years suggests that they are not always identical.

(*The witness withdrew.*)

SECOND DAY.

Wednesday, November 25th 1925.

PRESENT :

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E.
Mr. G. H. BAXTER } (*Secretaries*).

The Hon. Sir BASIL P. BLACKETT, K.C.B., recalled and further examined.

283. (*Chairman.*) Sir Basil, there is one point in your evidence of yesterday I should like to be cleared up preliminarily. Sir Norcot Warren desires me to ask you this question. In your evidence you say that the reserve of 109 crores is available against unforeseen contingencies. He would like to ask you if you consider this sum is sufficient, and, if so, to give your reasons? — That is under the sterling exchange standard. I think yesterday there was some confusion between two different points. One point was, what is the maximum of contraction of active circulation that you would conceive possible, and the other was, what is the basis for estimating the amount of sterling reserves that you would require. There is some difference of opinion as to the maximum figure by which you could possibly contemplate reduction of active circulation. I put the maximum at something like 25 crores, and Sir Norcot Warren, I think, suggested that 10 crores would be the maximum. That is the amount by which I could conceive the actual contraction of the circulation that is actively employed as a medium of ordinary circulation of currency. The size of the reserve, however, I think depends also on the amount that is likely to come out from hoards in a time of scarcity, and it also depends on the amount of adverse balance of trade against India in such a season, including in that adverse balance the expenditure which has to be incurred by the Government in or through London. I still feel that 25 crores is probably a large figure for the amount by which you could actually reduce the active circulation, but something very much more is required to protect your currency system against the rupees that might come out from hoards, and for that purpose you need a very much bigger reserve. Taking all the factors into consideration, my view would be that 109 crores is a very very safe figure for any possible demand that you may have, but that you have to take into consideration not merely the figure of reduction in active circulation, but generally the

pressure of rupees to exchange themselves into external currency, and that is a very much larger figure.

284. Will you kindly explain what is the difference between the latter two figures to which you refer, the rupees that might come out of circulation and the rupees that are needing to exchange themselves into foreign currencies? They seem at first sight to be the same?—There is a difficulty in getting a correct definition of what is a hoard and what is in circulation. In a sense all rupees are in circulation, but those that are hoarded in a good time are, I think, a special danger to the currency system if for any reason they come out of the hoards, and are potentially a danger to the circulation, especially if they are an addition to the volume of rupees seeking conversion into foreign exchange.

285. Then we may consider that in a year of pressure on exchange the rupees seeking conversion into international currency, into foreign exchange, may come from (*a*) circulation and (*b*) from hoards?—Yes.

286. There are one or two questions still to be asked, I think, to complete the picture of the sterling exchange standard. I want you to make clear, in the first place, the nature of the balance of 18 crores which you refer to in paragraph 13 of your memorandum. Am I right in supposing that this is obtained by a reduction of silver and rupee securities in the reserve? Your point is that an extra 50 crores of assets are required to balance the liabilities of the new currency, and you think that with this surplus there will still be a free balance of 18 crores. You say in that paragraph that "it would be tempting to apply this 18 crores to reduction of India's sterling debt, but in order to start the new scheme with an extra margin of safety, I would suggest that it should be used temporarily to relieve the new currency reserve of some of the surplus rupees"?—In essence, of course, this is arrived at by adding up the potential liabilities of the new currency reserve, 50 crores being added especially for the liability in respect of the over-valuation of rupees, and then on the other side by adding up the total of the existing assets in the paper currency and the gold standard reserves. They come to nearly 18 crores more than the total liabilities so ascertained. The memorandum then goes on to suggest that 18 crores might be used for capital expenditure as being surplus to reserve requirements. It might be taken out in any form, either silver or gold or sterling securities or Government of India rupee securities, but the suggestion is that it should actually be taken out in silver rupees, and that these should be held in stock until such time as the demand arose for new coinage for additions to the silver rupee circulation. When that happened they would be paid for, and the Government would have funds in rupee balances available for other expenditure. This 18 crores of rupees is simply a calculation of the amount by which the existing reserves are possibly unnecessarily large.

287. And an unnecessary margin according to the arrangement for which you are liable in regard to former reserves in respect of the silver side of the reserve?—It is in essence a suggestion that the gold standard reserve is 18 crores larger than is required. If you remodel the currency system on the lines suggested in this memorandum, you could get the same result by writing down the Government of India securities and reducing the created securities by a corresponding figure, and leaving the assets as shown in paragraph 14: silver, 90·7; Government of India rupee securities, 39·1; and sterling securities, 109·7.

288. That would be an equally possible course?—Yes.

289. What would be in your opinion the relative advantages of the latter course?—The reserve would, in a sense, be stronger. On the other hand it would contain an enormous amount of silver which is obviously not immediately necessary, and the question might arise of the desirability of selling some of that silver, in which case you would incur a loss, with no means of recovering it except by recreating the Government of India securities.

290. (*Sir Henry Strakosch.*) Will Sir Basil tell us what is the amount of silver he considers necessary to maintain the convertibility of notes expressed in a percentage of the note circulation?—I think the old rule used to be that you endeavour to prevent the amount of rupees in the reserve falling below a minimum figure at the beginning of the busy season. The figure I know is given in the Chamberlain Commission Report.

291. Yes, it is given at about 600 lakhs above the normal figure?—I may read from paragraph 107 of the report, which says as follows: "To meet demands from this and other causes during the busy season the Government consider that the stock of rupees in the reserve should not be allowed to fall below 24 crores on the 1st November in any year, or 18 crores on the 1st May in a year of active trade." That puts 18 crores as the minimum required in normal circumstances at the moment when the stock of rupees is likely to be lowest.

292. May I ask what was the note circulation at that time?—About 69 crores. But I do not think the size of the note circulation is entirely relevant. The question is really what is the maximum amount of rupees that are likely to go out in a normal season. If you keep the minimum balance of rupees at a figure of, say, 18 or 20 crores, and raise it to something like 24 or 30 crores at the beginning of the busy season, you can always use your sterling securities to buy silver and coin rapidly if there is an additional demand, and it seems unnecessary to go to the expense of coining a larger number of rupees than that until you are quite sure they are required, and I think the best way to provide for the absolute convertibility of the note into the silver rupee is to have adequate minting facilities readily available, and sterling assets readily available from which to purchase the silver as required. I do not think a figure based on the proportion of the total note circulation would give you such useful results as a calculation arrived in the way I have suggested.

293. You suggest that the first rush in the case of a desire to convert would not be more than 18 to 24 crores, and that the balance of the demand might be met by minting?—Yes.

294. That depends upon the capacity of the Mint?—I think Colonel Willis is coming to give evidence before the Commission, and I hope he will be able to give you interesting evidence on that point. That is why I have suggested in my memorandum that it is not really necessary to lay down a minimum. I would rather lay down a maximum, to prevent the unnecessary coining of rupees before they are required than insist on a minimum by statute.

295. (*Chairman.*) We will probably be able to get from Mr. Denning statistics as to what within recent years have been the limits of the seasonal fluctuations in the demand?—I think Mr. Denning would give most useful evidence on that point. Figures are as a matter of fact given in one of the appendices to the memorandum on the history of the Indian Currency system. Appendix III gives the absorption of currency by the public, from 1899 to 1924-25.

296. That gives the resultant *plus* or *minus* figure for the year, but does it throw any light on the amount taken out in return of silver rupees at the commencement of the busy season for the financing of crops?—I agree that monthly figures are required which are, however, easily obtainable. I think Mr. Denning or Mr. McWatters would be able not only to give the figures but to elucidate them more fully before the Commission.

297. More or less in this connection it may also be useful to have some figures as to what, in recent bad years, has been the demand for sterling to maintain the rupee in each year of exceptional pressure, *i.e.*, by the demand for reverse councils?—Of course our chief experience there is the abnormal year 1920

when the facts are considerably obscured by the coincidence of the attempt to bring the Babington-Smith Committee's recommendations into effect. The most illuminating years are probably 1907-8 or 1908-9 and the year of the outbreak of the war.

298. On that point I think probably you have given all the figures in Appendix II to the historical memorandum?—Yes.

299. I think this would be the appropriate place to ask some questions which Sir Henry Strakosch desires me to ask relating to the constitution and the nature of the securities to be held in the reserve under the sterling exchange standard as defined in paragraph 11 of your memorandum. Do you not regard self-liquidating Bills of Exchange a more desirable cover for the note-issue than Government of India securities?—Theoretically, yes, for that part of the circulation which is elastic. But in Indian conditions as they are at present it has been found extraordinarily difficult to provide even the maximum of 12 crores of self-liquidating hundis required for the working of the emergency currency system. Broadly speaking, they do not exist. The Imperial Bank had, I believe, to put some pressure on their clients to convert cash-credits into hundis in order that they might have self-liquidating hundis to put up as a cover against what the Imperial Bank was borrowing from the paper currency reserve. It was recognised as not being a satisfactory way of meeting the situation, but the Indian system of business does not at present create any very large amount of suitable internal bills. The Government had also to accept the word of the Imperial Bank for it, as to whether a Bill was a genuine self-liquidating bill or not. The Imperial Bank did its best but very often the document on the face of it bore no evidence at all as to whether it was a genuine trade bill or not, so that I think my answer would be that theoretically there are advantages in having self-liquidating Bills of Exchange as cover for the elastic portion of the note-issue rather than Government of India securities, but that there is no practical possibility of substituting one for the other in India for a generation or more, until the public gets accustomed to the Bill of Exchange as an instrument of credit. It is a most desirable development, I think, but it is one that will have to come very slowly.

300. (*Sir Henry Strakosch.*) I may say that the same trouble is experienced in other countries which have introduced a central banking system, but the habit of drawing Bills is rapidly increasing in those countries?—Yes. But in a country like India unless, as would be most desirable, you get Bills of this sort drawn largely for the movement of agricultural crops it is almost out of the question to arrive at a situation at which you can rely on self-liquidating internal bills as cover for your note-issue.

301. (*Chairman.*) The second question of Sir Henry Strakosch's is this. If so, why is the holding of such Bills limited to a maximum of 20 crores (on present note-issue equal to 10·5 per cent.) irrespective of the amount of notes in issue. I take it that is not completely answered by the answer to the first question, because one might say that, even though you do not think you could get so much, why should you necessarily limit the theoretical maximum of your best security?—I put the figure at about double of what you are likely to get and left it at that.

302. Then why under those circumstances impose a maximum at all if a maximum is going to be imposed by the limit of supply?—I thought it would be better to put a maximum for the time being until you were sure that the right sort of Bank Bill developed and was available in sufficient quantities, leaving it until that date to alter the law rather than put in an illusory figure which might lead to attempts to create the wrong sort of bill.

303. The latter consideration is no doubt very important. Sir Henry Strakosch's third question is: Would Sir Basil Blackett see any objection to giving Bills of Exchange first rank by permitting up to 40 per cent. of the note-issue being covered by Bills of Exchange, the cover by Government of India securities being limited to an amount equal to any deficiency in the holding of Bills below 40 per cent.?—There is of course the objection that I have already given that you do not want to hold out visions of a system that you do not see working; with the possible result of the creation of the wrong sort of trade bill. Other reasons of course would be that at any rate at the time of the introduction you do want in order to reduce the cost of the transition to the Indian Budget to be able to place a considerable quantity of Government securities in the reserves to cover the nominal loss incurred by the sale of rupees.

304. (*Sir Henry Strakosch.*) Would not the Imperial Bank, when Bills are presented, be particularly careful to see that the bills are of a quality which is suitable as cover to notes?—The trouble is that if the Imperial Bank did that, it would hardly be able to use the existing facilities for borrowing even up to the total of 12 crores. It is careful of course to see that the Bills against which it borrows are not entirely of the wrong sort. But as I said, it had to go out of its way to invent bills of the right sort which do not normally exist and to encourage its clients who had cash credits to convert into hundis by offering to pay stamp duty. That is the essential difficulty. India being at present what it is, you cannot contemplate the Bill of Exchange taking the place that is assigned to it in the financial system which Sir Henry Strakosch rightly regards as most desirable.

305. What I am particularly anxious to avoid is to set a maximum for the most desirable security against the note-issue. If it is a fact that there are not sufficient bills available certainly at first, then the Government of India securities will still bulk very largely as a cover, and, as the habit of drawing Bills increases, so gradually the Government securities recede. If we take the nature of the check that would be put upon the quality of Bills by the Imperial Bank and the slowness of introducing the new habit, would that not be sufficient to eliminate the maximum which you have set?—I appreciate the point, but it does not seem to me to be probable that within a generation you would be able to use self-liquidating bills of exchange, internal bills of exchange, to the extent suggested. It would be quite possible no doubt by merely a nominal change in the finance to leave a wider margin, but I do attach importance to not holding out hopes of doing that prematurely.

306. (*Chairman.*) I have followed your objection to that as being that when you specify a maximum, according to the old rule it is apt to become a minimum; and if it became a minimum, and if it is used as a working minimum that might tend to create the acceptance by the Bank of bills not of the highest type?—Yes.

307. Continuing Sir Henry's question on another aspect, you are no doubt aware of the provision in the more modern Central Bank Statutes that demand liabilities of the Bank are required to be covered by a minimum reserve varying from 35 to 40 per cent. Do you not consider it desirable that a similar provision should be introduced in the reserve provisions of the Imperial Bank?—That I think raises the very interesting general question of the form in which the issuing Bank should keep its statutory published statements. The English system is to have a separation between the banking and the issue departments. Under the English system there are statutory rules in regard to the composition of the cover for notes issued by the Issue Department, but the extent to which cash is kept to cover demand liabilities in the banking department is left to the unfettered discretion of the Bank Court. As I gather, the suggestion here is that in addition to the rules regarding the proportions or amounts in which the cover against the notes issued is to be kept, there should be rules

requiring the bank to keep a minimum cash cover for its liabilities other than its capital and reserves.

308. (*Sir Henry Strakosch.*) May I say that I had in mind not domestic cash, but gold or gold securities in our case?—I have always had a preference for the separation of the issue department and the banking department in the form in which the Bank of England's statutory return is kept and I have also a preference for not fettering the discretion of the bank as to the nature and the amount of the cover they keep for their demand liabilities. It seems to me that if you lay down a rule that 35 per cent. has always to be kept as a minimum against demand liabilities you do more or less immobilise that amount of reserve and encourage the view that the reserve is to be looked at and is not to be used. The Federal Reserve System of the United States has of course very elaborate rules on this point. I confess they always seem to me to have been imagined out of the misconception that the greatest danger is the habit of a banker to run up demand liabilities and not to provide cash against it. The natural result was that in America, where that had been the danger to guard against in the case of small banks throughout the country, it led to the belief, which was quite common, if I may judge by the newspaper and other articles that appeared in the United States when the Federal Reserve System was being started, that a bank was never really safe unless it kept 100 per cent. of the liabilities in cash. I should not personally feel attracted by the idea of laying down a statutory provision that either the Imperial Bank or any other bank in India must keep as a minimum 35 per cent. of its liabilities in certain forms.

309. (*Chairman.*) Would it or would it not meet the case that your objection to the proposal on the ground that it tends to immobilise the reserve is to some extent met by the system permitting an extension of the note-issue under conditions as to tax in times of pressure on the currency?—That is the suggestion I have myself put forward, but that is in respect of a cover against the note-issue, and it is rather a different question from the one which Sir Henry Strakosch was putting in respect of cover against demand liabilities.

310. That is first what I was trying to clear my mind about. Would that not react on the proportion of the amount of deposit liabilities and reserve?—If you have rules as regards the proportion and the amount of the assets that you hold against the note-issue, you do get an immediate reaction in the banking department on the amount of the cash or cover held against demand liabilities. As demand liabilities increase, a prudent manager of a bank wants to increase his cash. The normal way in which it is done in the case of a bank of issue is by an additional transfer of notes from the issue department to the banking department, and you require larger cover in your issue department and you hold funds in cash in the banking department.

311. (*Sir Henry Strakosch.*) Is it correct to say that that reserve is a precautionary measure for a possible sudden increase in the note circulation, the deposits being potential currency, and in times of crisis these deposits become suddenly increased and withdrawn in notes when these notes would be required to be covered by the prescribed reserves. It is therefore really a precautionary measure for a possible sudden increase in the circulation?—I accept that. It is, of course, also a precautionary measure against any tendency on the part of the bank to make advances or create demand liabilities against itself without providing sufficient cash against them. The real truth to my mind is that you want to see for a central bank two different sets of accounts, one for the issue department separate from the Banking department, on the British lines, and then another with the two amalgamated. When I was at the Treasury I used to keep regularly a Bank of England return drawn upon Continental lines. It is now published every week very much in that form in the Economic Review of the foreign Press. But my objection I think, the essence of my objection such as it is, is to the suggestion to have a statutory figure for the minimum cover for demand liabilities. That is imposing a limitation on the discretion of the banker in cases where he can act better if left to his own discretion.

312. You agree the central bank has to be particularly cautious and to see further ahead than a commercial bank?—I agree, but at the same time I think one does want to be careful not to pander to the popular belief that a reserve is there only to be looked at and not to be used. That is the effect of laying down a minimum.

313. (*Chairman.*) Continuing Sir Henry Strakosch's questions on another point, you propose that special provisions should be made for the Imperial Bank to undertake to supply the funds required by the Government of India in London. Have you in mind a binding engagement to effect the transfer at the prescribed exchange rate?—The suggestion is that the bank should enter into an agreement with the Government of India to supply sterling month by month, not at a prescribed rate, not at a single rate prescribed in advance, but at some rate for which various alternatives are suggested, the one favoured being the market rate of the preceding month. We had in mind that the Imperial Bank might enter into something in the nature of a contract for a period probably terminable at short notice to supply all remittance required at that rate, it being of course understood it would be obligatory on the part of those who require money to give ample notice of the amounts likely to be wanted. Then, subject to any provision as to the termination of the arrangements it would be an obligation on the bank to carry out these transactions.

314. Subject to any provision as to the termination of the arrangement, it would be an obligation on the bank to carry out these transactions?—Yes, that is what is suggested.

315. That leads to the next question. Do you think that the bank can safely enter into such an engagement? To make clear the meaning of that question I will ask at the same time, would such a provision not mean giving the Government of India a preference in the matter of remittances as against the general public?—As regards the rates suggested there is no suggestion of preference. That would be merely for convenience. You might alternatively take the market rate of the day of the transaction. Is the suggestion that the Government of India would have the first call on a possibly limited supply?

316. Precisely. If there was not enough to go round, the Government of India would get it all and the public would get none?—Yes, if there was not enough.

317. (*Sir Henry Strakosch.*) You might, by using persuasion, get the general public under such an arrangement to postpone their remittances in order to enable the Imperial Bank to meet the contractual requirements of the Government?—The public have *ex-hypothesi* a right under any of the systems adumbrated here to take rupees to the Imperial Bank and get sterling at a fixed rate and at a minimum rate and that right is unlimited.

318. But why should the Government not rely upon that condition?—In fact the Government can only get sterling in London provided they pay for it in India. There is no suggestion that the sterling should be advanced to the Government, it is against payment in India.

319. I appreciate that. But you just said that, if the supply of sterling is not sufficient, the system would break down. You suggest by that that the public should be content to rely upon the conditions laid down under the statute that the bank has to maintain exchange within the gold points. Why should not the Government also be satisfied with that consideration, and why should the Government need to make a special contract?—I do not think

there is any suggestion that money should be reserved to the Government. The bank's obligation to supply exchange at the gold point is unlimited, provided it is paid for in internal currency. The fact remains that the Government require remittances which are a very large figure in proportion to the total each year. You might, instead of this arrangement, have an arrangement corresponding to the present one by which Government bought in the market and sold Bills in London. I do not see that would put the bank in a better position than this arrangement. The bank would know better where they were under this arrangement than if the Government were doing its exchange business on its own account independently of the bank, though it is an alternative that might be adopted if preferred.

320. The impression upon the general public would be that there is a scarcity of foreign exchange, that the supply of the Imperial Bank might run dry by supplying the Government with exchange instead of the public, and in the circumstances, would it not be better to omit this special provision in the contract?—If this special provision, which is only put forward for consideration, were omitted, I think it would be important that you should have some definite understanding as between the Government and the bank as to the methods by which they are to secure the very large amount of sterling which they require annually. The trouble, of course, is that at some stage every now and again, the question of borrowing by the Government in London in order to prevent the demand for exchange exceeding the available supply will arise under any system, and on that point the Imperial Bank and the Government will have to fight it out. That must anyhow happen. Not that they would necessarily disagree, but that is the position, especially if the Government is engaged in financing a capital programme of the kind that is before the Government of India for the next generation.

321. Would it, therefore, not be sufficient to say in the agreement that the Imperial Bank should undertake to purchase sterling exchange on behalf of the Government?—If that was decided to be the better method of dealing with this difficulty, I should have no objection. But I should have thought the bank itself would like to be protected by some contract of this sort.

322. (*Mr. Preston.*) If the bank gives you a contract of a monopoly right and supposing that it worked on average monthly requirements, would that not put it in the position of gambling in exchange?—An exchange bank is always in the position of being able, if it wants to, to gamble in exchange—not necessarily to its profit. But I don't think this would be an encouragement to anybody to gamble nor that the Imperial Bank would desire to gamble.

323. (*Sir Henry Strakosch.*) Moreover, under the sterling exchange standard, sterling would be one of the reserves of the bank?—Quite.

324. Therefore, the holding of sterling would not be a gamble but would be the holding of a very desirable asset to be set against the note-issue?—The Bank would obviously have to regulate its holding of sterling with reference to its knowledge of the demands that are going to be made for sterling by one of its biggest customers, namely, the Government. It must be desirable to give as much notice as you can of the time and amount of those requirements as far ahead as may reasonably be arranged. This suggestion was made as much from the point of view of the Bank as from that of the Government.

325. (*Sir Purshotamdas Thakurdas.*) In paragraph 6 of Mr. Denning's memorandum regarding transfer of management, it is stated, "if, therefore, the Imperial Bank is to be given control of the note-issue and the Paper Currency Reserve, it must take, at any rate, a part of the responsibility for the maintenance of exchange and for the remittance to London of the sterling requirements of Government." It indicates that you expect the Bank at least in part to take the responsibility for the maintenance of exchange. The Bank transfers the funds, therefore, at the minimum rate of the day or of the previous month?—It is a small part in a way of the bigger responsibility that is suggested being put on the Bank, namely, of undertaking always to give sterling exchange or exchange at the gold point and if it is going to undertake that obligation, I think it would naturally ask that it should be in possession of as much knowledge and control as may reasonably be given to it with regard to the requirements of a particularly large remitter.

326. Does it not actually lead to temptation under certain circumstances to gamble in exchange?—I do not think so. It has got to have very considerable control over exchange if it is to manage the currency system, because it will have to regulate the amount of its sterling holdings and its holding of foreign Bills, to use the wider phrase, with reference to the demands on the exchange from time to time. It is after all a responsibility that is undertaken by every central Bank.

327. That is transferring the control of operations in exchange from the Finance Department to the Imperial Bank?—That is very much what it comes to.

328. In paragraph 8 of Mr. Denning's memorandum on a Gold Standard for India, you have this: "Undoubtedly, the ideal to be aimed at is the system now in force in Great Britain under which the note is the sole full legal tender in circulation, and the gold value of sterling is stabilised by the statutory obligation imposed on the Bank of England to buy and sell gold at rates corresponding roughly to the par of exchange." Is that system likely to be feasible in India with the Imperial Bank?—That is, I think, very much the system which is suggested as the first stage in paragraph 10 of the same memorandum in the programme of the advance towards the gold standard.

329. Does the system in vogue in the Bank of England carry with it any responsibility to maintain exchange?—Certainly it does. It carries this responsibility, that the Bank of England has to work its discount policy and its credit policy very carefully in order to maintain its statutory reserves and still be able to give gold for export at the gold point.

330. Why do you not rely on the Imperial Bank in the same way instead of making it responsible for the maintenance of the exchange?—I do not think there is any suggestion that we have made to the contrary. The responsibility of the Imperial Bank will be exactly the same as the responsibility of the Bank of England.

331. If you think that is feasible with the Imperial Bank, why do you saddle them with any responsibility to maintain exchange?—That is only another way of putting the same thing. The responsibility is the liability to give gold or sterling or whatever it may be or to buy and sell gold or foreign exchange at fixed rates. That is the responsibility that is given to it. When you say that you are giving it responsibility for the maintenance of exchange, it is only meant to say the same thing in other words. I look upon that as involving the responsibility for the maintenance of exchange.

332. It amounts to the same thing as the responsibility of the Bank of England in buying gold?—Yes.

333. (*Chairman.*) This will lead us to a discussion of the gold exchange standard in comparison with the sterling exchange standard with which we are at present dealing, so that I think it would be convenient if we conclude the questions on the sterling exchange standard and then resume the discussion which you have just raised in connection with a fuller discussion of the gold exchange standard. The last of the series of questions which I am asking on behalf of Sir Henry Strakosch deals with

another aspect, viz., would it not be preferable to express the Reserve requirements in percentages of the Note issue rather than in fixed amounts?—It is largely a matter of individual preference which form you take. There are objections I always feel to expressing the amount of gold, for instance, that is to be held in a note reserve in the form absolutely of a percentage proportion as, for example, is done no doubt in the United States and other places. Because, it means that at the point when you are getting near the minimum percentage, a withdrawal of a lakh of rupees in gold compels you to force a larger contraction of the currency. Suppose the proportion is 33; you would force a reduction of 3 lakhs in the outstanding circulation for every lakh if you withdraw any gold at that stage. It means that it tends to make contraction rather violent and expansion rather too easy as compared with a fixed minimum above which you get an addition or contraction of one rupee of circulation for one rupee of cover.

334. (*Sir Henry Strakosch.*) But in fact, that would be the case any way, even if you express it in a different way—for instance, if the Bank feels that a reduction of the reserve requires a measure to be taken?—In fact, it is very nearly so. But the Bank has a little more elasticity as to the moment of its action if it is getting near its minimum fixed figure. It no doubt does take very activo steps in any case, but when it is getting down to its minimum it does not have to reduce 3 lakhs of circulation for every lakh that goes out, but only one lakh.

335. But do you not agree that it is a good thing for the public to appreciate what the Bank return really means and take warning of a reduction in the reserve percentages when they appear in the Bank return?—I attach very great importance to having a currency system which is reasonably intelligible to a fairly large circle. But I am not sure that a proportion is any more intelligible than a fixed figure.

336. Except to this extent, that one presents the matter in a more concise form to the public than if the public had to work out the reserve ratio itself, which, I believe, is almost instinctively done?—In England we have not got proportions, and it is done instinctively. You have only to add and subtract, but not multiply. I think the only real answer is that I have a personal preference for the fixed minimum rather than the percentage method throughout, but there are advantages and disadvantages in both methods, and it must ultimately be a question of a balancing of those advantages.

337. (*Chairman.*) Is not the objection that you advanced with regard to the forced redemption of the currency met by the mechanism as to the extension under tax to a higher limit?—That applies under either alternative.

338. (*Sir Reginald Mant.*) With regard to the question of fixed amounts, is it not one objection that it requires legislation to change the fixed amount? They do periodically require readjustment as the note issue increases?—Yes; that is possibly an objection. But at the same time it may possibly be advantageous in requiring the matter to come before the legislature from time to time. Sir Reginald Mant is no doubt thinking of the position before the war, under which the total of the Government securities in the paper currency reserve had to be altered by an act of the legislature from time to time, whereas it might have been reasonable to give a proportion right through and avoid that legislation. I have endeavoured to meet some of these difficulties in my plan by making the gold figure a minimum. I have endeavoured to make my system flexible by leaving the amount of sterling securities and rupee securities other than Government of India securities variable within the figures available. But I think I should answer Sir Reginald Mant in much the same way as I answered Sir Henry Strakosch, that there are both advantages and disadvantages in having the matter come periodically before the legislature for altering the fixed figure.

339. To come back to the amount of rupees that you think should be held in the reserve, you suggest that, normally, the reserve should not be allowed to exceed 50 crores, but it should be laid down that under no circumstances should the rupees so held exceed one-third of the total liabilities. What would happen if this limit is exceeded? Will the Bank be compelled to melt down the excess and sell it as bullion?—That is what is suggested, that the Bank would have to have it melted and sold as bullion, but would at the same time have a right to withdraw one rupee from the amount of cover required for every four that you melt down.

340. Whatever the strength of the silver market, there would be sales of silver?—Or they would have, temporarily, to hold it as part of the cash in the Bank. It ought not to be a frequent occurrence.

341. Would it not be reasonable to allow the Bank in those circumstances to hold rupees in the currency reserve by decreasing the amount of the rupee securities?—It would, I think, possibly be a way of solving these difficulties which might periodically arise. But the objection to that in the actual form would be that if the price they pay to the Government for the right of note issue depended, among other things, on the amount of their rupee securities and the interest thereon, they would then be holding these surplus rupees at the expense of the Government. If the result was to reduce the amount of their rupee securities they would pay a lesser amount to the Government in consideration of their monopoly of note issue. It depends on the terms on which the profits of the note issue are accounted for by the Bank to the Government. If you had a formula which did not depend on the amount of the rupee securities or the amount of the invested portion of the reserve, or if you included silver above a certain point as part of the invested portion of the reserve, then it would be at the expense of the Bank and not at the expense of the Government.

342. Apart from that difficulty of profits of investment, would there be any objection to having a limit simply to rupees and rupee securities instead of one limit for rupees and the other for rupee securities?—Of course, there is the economic side of that objection. I was giving it from the budgetary point of view—the loss to the Government revenue; but there is also the economic loss to India from the holding of an unnecessarily large amount of bullion; and if the Bank chose to carry 100 or 150 crores of rupees, you would have the loss on that—on the capital spending power of India.

343. But we are assuming that the market was not available and the rupees had to be carried?—The rupees have either to be carried or sold. If you carry them, you lose the interest and if you sell them, you make a capital loss at an inconvenient time. It is always difficult to know whether it is wise to take that loss or not. It is a problem before the Government and before this Commission at present whether we are wise in carrying as large a rupee reserve as 90 crores, or whether it is wise to sell some of that even at a capital loss on the ground that you would get in place of hoarded bullion some productive capital investment. The object of this provision was, I think, to put a certain amount of penalty on the Bank for unwisely risking the position in which there were too many rupees in circulation.

344. But could they not have avoided it to some extent by altering their credit policy?—They could avoid it to some extent if they altered their credit policy and also it will probably be a question of how comfortable they choose to keep themselves against the possible risks of sudden demands for rupees. If they relied rather on coinage when extra rupees are clearly required than on carrying a large reserve all the time, they are less likely to overtop the maximum. I think some provision is required

to prevent the easy method of getting rupees coined *ex majori cautela*.

345. When the redundant rupees have been absorbed this difficulty is not likely to arise?—It is with a view to the future rather than the present. One recognises that there are too many rupees for any reasonable reserve requirements at the present moment. One of my suggestions is that the Government of India should take 18 crores right off. I think you would certainly have to add to what I have said here, that the condition that the rupees should not exceed one-third of the total could not come into force until such a time, at any rate, as there has been a fall of silver to below 40. That would be merely a temporary arrangement. I agree there is a risk in the next year or two even if these 18 crores are taken off by the Government of India. A further return of rupees from circulation might take the figure above the proportion. I was legislating for the future when things are normal.

346. (*Sir Henry Strakosch.*) May I ask whether the inducement to issue an undue amount of rupees is not greater so far as the Government is concerned than the Bank, and would it, for that reason, not be advisable to limit the issue of rupees coined by a provision that an addition to the rupee coin currency should only be made at the request of the Imperial Bank?—I would welcome that condition. I think it was implied though it was not stated.

347. Of course, a seigniorage profit might be particularly attractive?—That condition was implied, though at the same time the seigniorage is not particularly attractive to the Government in this arrangement, because they have to supply the value of one rupee out of every four for the reserve. But there has been, I think, in the past a tendency to coin rupees with some undue freedom though not for the sake of the seigniorage. It went to the gold standard reserve and not to the Government's revenue.

348. (*Sir Reginald Mant.*) Would it clear up the arrangements you have in mind if they are put this way. At present, as you know, the Government remits freely when there is a strong exchange. What would be the arrangements in future; would they be in a position to take advantage of the strength of the market, or would they only have to adjust the budget, and would they only get their requirements from month to month?—Our suggestion is that they should not keep any balance in London of any considerable size except for the purpose of their monthly requirements. I think the present position is largely a matter of chance—there is a profit from the point of view of the Government revenues from remittance at an earlier date, not merely because they can take advantage of the favourable exchange, but still more because they do not get interest from the Imperial Bank on their balances in India and they do get interest on anything they send to London and lend out. I think that is an adventitious circumstance which was hardly in view when the Imperial Bank took on its present contract. It has no kind of sacrosanctity.

349. You mean to say Government would lose and the Bank would gain by a change in the arrangement?—That is one of the things that would have to be taken into consideration in any new arrangements for payment by the Government to the Bank or by the Bank to the Government for services rendered. It is undoubtedly a point in which there would be additional possible profit to the Bank, and it will have to be taken into consideration in the arrangement between the Bank and the Government. But of course if the Bank is to be responsible for the major question, namely, the maintenance of the gold points for the exchange, I think, they must have some means of controlling the action of Government in regard to remittance for Government's own purposes. The Government could hardly come down on the exchange market at the maximum and remit the whole year's requirements or try to remit the whole year's requirements and expect the Bank to take the consequences.

350. No, I do not think they would?—The arrangement can be made without any net loss to Government. Of course this will be taken into account in the general arrangements between the Bank and Government.

351. Government would not then lose interest on the whole?—It might or it might not. I think it will be true to say that the tendency might be for them not to get such favourable rates and to lose some small amount in interest.

352. The Bank will gain by having larger sums of Government balances instead of their being remitted to London?—Of course, the size of the Government balances partly depends on the remittance policy, for example, remittances made as against the paper currency and additions made in the Government balance against sterling. But it would perhaps tend either to increase the total amounts of the Government balance in India and reduce the amount in London or to economise the Government balance altogether. In the latter case the Government would get a return and the Bank would not get it. It is a point which will have to be taken into consideration with reference to the question of remuneration.

353. (*Sir Henry Strakosch.*) Would not the point be met by giving the Government all surplus profits of the Bank after paying a moderate dividend to the shareholders?—I think that question will have to be put to the shareholders of the Bank. As I said yesterday, the Government take no share in the profits of the Bank at present. One of the possible methods of arriving at a solution of the really difficult problems which will arise when the Commission is ready to deal with them is for the Government to take a share.

354. (*Chairman.*) Let us now pass to the gold exchange standard. The mechanism is, generally speaking, the same. It will therefore be possible to deal quite briefly with the gold exchange standard, dealing in fact with the differences between the two standards. In the first place do you consider it an essential feature of the gold exchange standard that gold coin should be put into circulation?—No. It is not an essential feature, either of a theoretical gold exchange standard or even a theoretical gold standard.

355. It has commonly been regarded as the central feature in the past, but that you ascribe to the circumstance that a complete apprehension of the gold exchange standard has not been arrived at?—Yes. That was the Victorian view of the gold standard.

356. Supposing anyone were to recommend the adoption of a gold exchange standard, one might eliminate any necessity for considering means for promoting the circulation of gold?—In theory, I think the circulation of gold coin in any form is wasteful and undesirable. The difficulty is to satisfy the public with a currency system in any country in which they are refused gold coin.

357. That is one of the chief considerations, but it is not an essential feature?—I agree that it is not an essential feature of the gold exchange standard that there should be a gold currency in circulation.

358. That is a consideration which perhaps will be more conveniently dealt with in connection with the gold standard?—Yes.

359. If it is not an essential feature, and if gold coin were not put into circulation, would the gold exchange standard be more expensive than the sterling exchange?—I think so. Because you will have an additional liability to provide gold in certain circumstances for external purposes as well as sterling and you would certainly have to keep, gold: theoretically you need not keep gold in your reserve in a sterling exchange standard, but in practice it will be difficult to set up such a system with no gold from the point of view of popular opinion both in India and in England. I think even the Bank of England would dislike such a system. A

system where there is no gold will not be liked by anybody. Apart from that the gold exchange standard does necessarily involve keeping an important proportion of the reserve in gold.

360. Assuming that in practice you must keep some of the reserves in gold under the sterling exchange standard, would it be necessary to keep a higher proportion under the gold exchange standard?—Yes, because you only want your gold under the sterling exchange standard, and it is in effect kept only, in order to assist the Bank of England in maintaining the convertibility of sterling into gold. Under the gold exchange standard, gold is kept to protect India against the liability of having to deal with a situation in which sterling has gone away from parity with gold. Gold is needed in view of your obligation to maintain the convertibility of your rupee into full value currency in any country in which gold is actually on a par with the local currency.

361. Would not what was adequate for the first purpose, *i.e.*, under the sterling exchange standard, be adequate also for the second purpose under the gold exchange standard?—Yes.

362. On what assumption are you saying so?—I think you could say that gold is unnecessary only on the assumption that the probability of sterling departing from parity with gold is so remote that you need keep no reserve against it.

363. What order of difference between the two amounts do you contemplate for the two purposes?—One wants to have it clear what the liabilities you undertake would be—it would, I suppose, be to maintain the parity of the rupee with sterling, or say, the currency of Amsterdam, the florin or the American dollar, whichever of these three did not depart from gold. I assume for the moment that you do not want gold for circulation in India. In order to do that, you should not rely solely on sterling securities. I do not think you ought even to rely on sterling securities *plus* gold, but you would probably have to hold 40 or 50 crores in gold, which you would otherwise have been able to hold in sterling securities.

364. You mean an additional 40 or 50 crores?—No. I mean 40 or 50 crores of gold in addition to sterling dollar or florin bills—of course, in all these things one is in a theoretical region—because it is extremely difficult for the Government of India and might be difficult for the Imperial Bank to manage a system of this sort though it is a system which is managed by the Central Banks on the Continent at the present time and though they keep in their portfolios bills of various gold standard countries.

365. Agreeing that it is theoretically sound to keep the reserve in, say, dollars or in the coinage of other gold standard countries, what is the necessity then of keeping any further balances in actual gold at all?—I suppose even in a theoretical sense you want to provide against the contingency that every other currency has gone off parity with gold and still you are gold. It is a remote region but that I think is essential.

366. When one is considering the practical necessity, both from the point of view of working the exchange and of public estimation, does not it make it a necessity to keep the gold balance in addition to the foreign currencies?—In practice most of the countries who are in a similar position do the same. I suppose one would perhaps be safe if one had a portfolio containing American Dollar, Dutch florin, and German and sterling bills even if there was no gold.

367. (*Sir Henry Strakosch.*) I observe Mr. Denning's proposal does not provide for gold to be given in exchange for rupees but for foreign exchange. Therefore he does not contemplate any holding of gold, or rather he does not contemplate the obligation of the Imperial Bank to give gold for rupees but merely foreign exchange?—I do not suggest that gold is absolutely necessary, but Mr. Denning's proposal does suggest that gold will be required in his reserve.

368. His reserve provides for a minimum holding of gold?—Yes, but if you look at the provisions he makes with regard to the establishment of a gold exchange standard you will see he merely suggests in his memorandum, under clause 7, sub-section (D) that all bank notes should be payable on demand in rupees or foreign exchange at the option of the presenter; that the currency of the country would consist of (*a*) overvalued silver rupees convertible into foreign exchange which would be the equivalent of gold and (*b*) notes convertible into silver rupees or foreign exchange as above.

369. That is the whole obligation?—Yes.

370. Therefore would it not be better to say that it is not essential under a gold exchange standard to hold gold or undertake to give gold for domestic currency, but that it would nevertheless be advisable to hold gold so as to avoid the ill-effects of releasing at an inopportune moment the great amount of securities that might be held in the form of bills on gold standard countries in which those securities are payable?—I accept that statement: under neither system, the sterling exchange standard nor the gold exchange standard is the holding of actual gold absolutely essential. But some holding will probably be desired or desirable in both cases, and it would be a larger one in the second case.

371. (*Chairman.*) I should like to ask you one more question on this point. Supposing under the gold exchange standard system or indeed under the sterling exchange standard, you were to hold part of the reserve in gold, in what form do you propose it should be held and in what manner should it be used?—You mean the location, and in what form, either bullion or coin?

372. Yes, and in what way should it be used. How should it be brought into account?—The probability is that you will in fact continue to hold it long after you have failed to remain on the gold exchange standard in case of a crisis. Theoretically you hold it I think in order to assist you to liquidate your securities at a time of difficulty, so that you may not be forced to sell at a considerable loss when the market could not absorb them or might assist that market to absorb them by releasing a certain amount of gold that would enable it to absorb some of your securities at a better price.

373. Under what conditions will the public be able to obtain possession of that gold?—It would not be the public itself. The public itself will not have any claim to that gold. They will have a claim to be able to convert your rupees or notes into the currency of some other country which has not departed from the gold standard and see that their currency is at par with gold. Certainly it might be desirable to give the Bank an option of giving gold instead of foreign exchange. That will make the reserve a little bit more useful.

374. You would not cover it by an acceptance on the part of the Bank to give gold against internal currency?—No.

375. Would it be possible to frame conditions which would ensure that the gold is used for the purposes of export?—I think it would be very difficult, unless your application of the system took the form of giving gold in some non-Indian Port, *i.e.*, in some gold standard country.

376. Where does the difficulty lie? Would it be a danger of gold being exported to some neighbouring country and reimported?—I suppose it would be possible so to draw a statute that there is no liability to treat a port in say, Kathiawar, as a port to which you could export gold from Bombay; presumably that could be avoided. You would have difficulties in laying down exactly what constitutes the export of gold unless you have a simple rule that delivery of gold is made in Europe or America.

377. It might be necessary that the Bank itself should be the actual shipper?—Yes. It seems always difficult to enforce a rule that gold is given only for export. I understand it is not so in England. I do not think there is a rule at present that gold is

given only for export. I was under the impression that it is only for export but I was looking at the statute the other day, and I could not see any limitation.

378. (*Sir Henry Strakosch.*) I think that limitation comes to an end at the end of this year?—You cannot get gold coin but you can get gold bullion, either for export or for internal use.

379. (*Mr. Preston.*) You can obtain gold bullion and then you can exchange your gold bullion for coin. That is how we are supplying India now. For the time being we can buy gold either in the London market or New York, but the bank reserves to itself the right of saying, "I am not going to give more sovereigns" it reserves to itself, the right to withdraw that facility.

380. (*Sir Reginald Mant.*) You said, Sir Basil, that for the sterling exchange standard it is not necessary theoretically to keep actual gold, but in practice the Bank of England might require us to keep gold to support sterling. Do you think that the Bank of England can reasonably require us to keep gold in support of sterling. Do not other countries such as Japan hold sterling securities to support their exchange?—They do in practice hold considerable amounts of gold in addition to securities both in England and America. As a matter of practice they do so, and I had in mind one of the resolutions of the Genoa Conference, that is the resolution 11 of the Genoa Conference on Currency. It is suggested that one of the conditions of a country participating in the Convention of international exchange standard countries would be the maintenance of currency at its gold value by the provision of an adequate asset, not necessarily gold. It is further suggested that certain of the participating countries will establish a free market in gold and then become gold centres, and it is suggested that participation in the convention would be conditional on either the keeping of some gold reserves or the payment by the participating countries of some sum to the Central Reserve country as a condition of participation without keeping the gold reserve.

381. Might I suggest to you the desirability of keeping a certain gold reserve not for the purposes of supporting sterling, but in the interests of India itself so as to have cash in case of a large fall in sterling securities?—I think it would be very difficult to prove that it would be economical to do so. The extra interest earned over a period of years by not holding gold would in any probable hypothesis exceed the loss incurred by not having gold at the moment of liquidating securities.

382. Then you think we should keep gold not in the individual interest of India, but as a contribution of the general interest?—Yes, that is the theoretical justification, but the ordinary man is not always a currency expert and he would not feel happy unless we have a certain amount of gold.

383. (*Chairman.*) You have told us, Sir Basil, that you also lay emphasis upon the retention of a certain amount of gold as a protection of the security market?—Yes, that would be one of the justifications but my impression would be as I said to Sir Reginald Mant that if we are merely considering the most economical method of keeping the reserve, we shall probably lose more by not earning interest on the proportion locked up in gold than by having to sell securities at a reduced price at a moment of crisis.

384. You referred to the greater expense involved in the larger gold holding required under the gold standard than under the gold exchange standard. Are there any other objections which occur to you under the gold exchange standard as compared with the sterling exchange standard?—Theoretically I think it is a slightly better system perhaps than the sterling exchange standard, though it costs a little more, but it is a little more cumbrous without in fact protecting you to any reasonable extent against one of the two risks, against which the sterling exchange standard does not protect you, I mean against the rise in the value of silver above 48d. It does theoretically protect you against the possibility of sterling and gold being divorced, but it is not very easy to conceive circumstances in which many countries would be able to remain on gold if sterling had been driven away from gold.

385. To raise another aspect of the advantages of the two systems, can you tell us what relative percentage of India's foreign trade is with sterling currency countries?—In 1924-25, of the exports, 24 per cent. were to the United Kingdom, 12·7 to the rest of the British Empire. I am afraid I have not got separate figures for Canada or other non-sterling using parts of the British Empire. Of the imports, 54·1 were from the United Kingdom, and 8·1 per cent. from the rest of the British Empire, *i.e.*, 67·2 per cent. of the imports and 36·7 per cent. of the exports were from India or to India from the British Empire or to the British Empire.

386. Another material consideration is: Is it possible to ascertain what percentage of India's foreign trade, including the visible and invisible constituents of that trade, is settled in sterling currency countries?—I have no figure. I think it is generally agreed that over 90 per cent. of the trade is settled through sterling using countries.

387. Does the very large percentage of the trade which both takes place directly with sterling currency countries, and the still larger percentage which is settled in sterling, suggest that there is an advantage in linking the Indian currency to sterling?—Yes. May I add that during the war, had it not been for the rise of silver, it is quite probable that India would have done what Egypt did and remained linked to sterling, keeping her exchange all the time at par rather than allow her exchange to wander away from parity with sterling. Probably she would have done so. But on the whole it was for India's good that she did not. That would, of course, have meant a very large rise in Indian prices.

388. (*Sir Purshotamdas Thakurdas.*) Have you any figures handy about the operation of India's trade with the United Kingdom 15 or 20 years ago?—I have only got them since 1913. That is, I have the proportions. I have not actually available here the actual figures but, of course, there would be no particular difficulty in getting these figures supplied by the Secretaries very quickly. In 1913 the proportions were:—

> Exports, 25·1 per cent. to the United Kingdom, 16 per cent. to the British Empire; imports, 62·8 from the United Kingdom, 6·9 from the rest of the British Empire.

I have a handy volume here of Indian trade statistics in a rather interesting tabular form. There are, however, plenty of statistical data to answer all these questions.

389. Trade since 1913 with the United Kingdom has gone down, has it not?—That is on the statistics to date; of course, there has been a recovery since the war. The exports appear to have gone down by 1 per cent., imports by 8·1 per cent. The exports to the United Kingdom are 24 instead of 25, and to the rest of the Empire 12·7 instead of 16. There is a fall in the case of exports. In the case of imports it is mainly a fall in imports from the United Kingdom.

390. The sterling exchange standard has apparently risen only in the sense of the running away of sterling from the gold point?—Up to 1914 nobody distinguished between the two.

391. I think for the first time now there is a mention of the sterling exchange standard?—It is not absolutely the first time. It was I think stated casually by more than one Commission that it is in fact a sterling exchange and not a gold exchange.

392. How then would it affect our export trade with other countries like Japan, for instance?—It is very hard to say. The two standards would have exactly the same effect. There is no difference. I think in ordinary times for practical purposes I should certainly be in favour of keeping Indian currency at par with sterling rather than with gold, because the sterling exchange is the one that really

matters. On the other hand, once currency goes off parity, there is no knowing how far it may be going. Therefore, for the sake of safety you do want it to remain on a par with gold.

393. It would affect India prejudicially in the case of a very big depreciation?—Yes.

394. And would it not be desirable that India should remain on gold rather than sterling?—This is a matter which was argued before the Babington-Smith Committee but in circumstances so very different that it is not very easy to translate them into present-day conditions because at that time there was a big depreciation in sterling. Their difficulties were quite different.

395. The difficulty to my mind is the function of the Imperial Bank and the liability which it is proposed to be put on the Imperial Bank. I understood you at that time to say that the responsibility at present rests on the Bank of England and that it is the same as that proposed to be put on the Imperial Bank. Will you refer to Mr. Denning's note, the last sentence of para. 10 (1)?—Expanded, that sentence means that the maintenance of the exchange standard would not depend on the Bank's selling sterling at about the lower gold point but would depend on the liability to give foreign transfers on the presentation of notes of Rs. 10,000. The Bank would in practice tend to buy sterling at slightly above the gold point. It is the statutory obligation to give foreign exchange for notes of the denomination of Rs. 10,000 that fixes the lower gold export point. The difference in standard does not make a material difference, not from the point of view of the automatic stoppage of exchange. The absolute exchangeability of sterling in England into international currency is maintained by the liability to buy and sell gold. The position in India is that under this suggested gold exchange system the only unlimited legal tender is the note including the note printed on silver, that is the rupee, and the exchangeability of that inconvertible currency into foreign exchange is maintained by the liability to buy or sell foreign exchange at the fixed points. It is only different in form; in both cases you get convertibility by statutory regulation.

396. (*Mr. Preston.*) That is in so far as you suggest that it should be applied to India, you do not mean to empower the Bank of England to give us foreign exchange?—It does in practice give us gold.

397. How can you say that it does in practice give us Foreign Exchange? If I tender notes and get gold for export, I get gold for export. You can hardly say that the Bank of England is in practice giving me foreign exchange?—I do not agree. It is giving you the means of obtaining Foreign Exchange.

398. (*Sir Henry Strakosch.*) Is it not right to say that if the Imperial Bank held foreign exchange on a gold standard centre that foreign exchange could immediately be converted into gold on presenting notes at the mint in that particular country? Say, for instance, the Imperial Bank had dollar bills. Those dollar bills would be discounted in America. If you go to the United States mint, you can obtain gold at the standard price fixed under their mint act. Therefore foreign exchange is immediately convertible into gold and that is contemplated under the Genoa Resolutions in every one of the gold centres. So foreign exchange at a fixed price is equivalent to gold at a fixed price in the gold exchange countries? —That is so, I agree.

399. (*Sir Purshotamdas Thakurdas.*) Under the gold exchange standard choice is to be left to the Imperial Bank of the extent of their reserves in foreign currencies?—That of course does raise a difficulty, but it is a difficulty that arises more with reference to the payment to be made by the Bank of the monopoly of note issue. I think it would have to be left to its free choice as to how it would constitute its portfolio of foreign bills at any given time.

400. (*Chairman.*) There is one final question on this point that I desire to ask. As I understand it, under a gold exchange standard, as you have sketched it, it will be left to the free choice of the Imperial Bank to what extent it would hold its foreign gold exchange reserves in any of the foreign gold currencies allowed under the statutes?—Yes.

401. In view of the facts which we have noticed as regards the amount of trade which is settled in sterling, practically it will be necessary, I imagine, for the Imperial Bank to hold a very large proportion of those reserves in sterling?—Yes, in practice the proportion held in sterling in the portfolios of the Central Banks of the world is a very large one. It is very likely that in normal circumstances they would feel it unnecessary to hold actual Bills other than British sterling bills. If the Imperial Bank had undertaken an obligation such as it is proposed, some arrangement would be necessary by which it could immediately obtain funds in another centre if it had undertaken to give funds at any other centres.

402. Its holdings in other countries, for instance, of guilders and dollars, would rather be a tribute to theory than of practical utility?—Probably

403. I now propose to pass from the gold exchange standard to the gold standard. Underlying your memorandum and those of Mr. Denning and Mr. McWatters on the subject of the gold standard we find great emphasis laid upon the desirability of limiting the rupees as legal tender?—Yes.

404. That, I take it, you are putting quite rightly in the forefront as a point of cardinal importance Let me ask you some preliminary questions on the next heading: what, in your opinion are the disadvantages of the right of unlimited legal tender now attached to the rupee?—They are of course a matter of experience. I think the main disadvantage is perhaps that to a very great extent the rupee is the same as the note but printed on a particularly expensive material. When that note comes in for exchange to be converted into foreign currency, it is extremely difficult to make any use of the valuable material on which it is printed, and you therefore have to hold a reserve against this note printed on an expensive material not very greatly less than the reserve you have to hold against the note printed on such a material as paper. It is very difficult therefore to be sure that you are maintaining the convertibility of the rupee at all times into international currency unless you are both maintaining something in your own central reserve against part of that note and paying the expense of having a large part of the cover of that note actually in circulation at the same time. It is then this that it is convertible coin circulating as unlimited legal tender and you need as long as that is your main form of unlimited legal tender to maintain a reserve at the centre against it of an amount not much less than you would have to maintain if you had to maintain a paper note in so far as it is really an unlimited legal tender doing the work of subsidiary coin.

405. Will you explain to us how you get rid of that disadvantage by limiting the right of tender attached to the rupee?—By having your sole unlimited tender a fully valued coin, namely, gold: against the paper note it is quite easy to keep reserve at the centre when the note comes in and against the gold coin when it comes in out of circulation you need no reserve.

406. I might summarise what you have said by saying that it is a very expensive form of note?—Yes. You have to distinguish between the two functions of the rupee; one is its function as a subsidiary coin, and the other is its function as unlimited legal tender, and it is only that part of it which is functioning as unlimited legal tender which is really the subject of my immediate observations.

407. Do you get rid of that defect by the mere fact of limiting the rupee as legal tender if you do not also oust the rupee from circulation?—As I was saying yesterday, you do not need to oust the rupee to any extent from circulation proper. Possibly for the purposes of an actual medium of ordinary circulation India will require not much less rupees than she is in fact using for ordinary circulation at the present time, but if some other form of legal tender,

either an inconvertible note or a fully valued gold coin, has replaced the rupees in hoards, then all the difficulties which we are faced with at present when there is an inflow of rupees from hoards would disappear.

408. I understand you are not assuming, in detailing the advantages of the proposed gold standard, any substantial substitution as regards actual circulation as distinguished from hoards, of rupees by gold?—I think the figure that has been used is something like 10 crores; gold would take the place of 10 crores of circulation.

409. Is it in view of past experience of attempts to substitute gold for rupees in circulation that you are led to believe that the actual circulation of rupees will not be substantially reduced?—To some extent on the supposition that a population of the size of India's will continue to require some coin or medium of circulation of the value of a rupee in very large quantities and I do not think that the work that is done by that coin can be done to any great extent by a gold coin of a value such as Rs. 20.

410. Then you refer to another possibility. We are contemplating a position in which the public can obtain gold freely against rupees: may such an opportunity not lead to the substitution of gold in circulation for notes?—To some extent yes, it is a possibility. I do not think from such indications as one is able to obtain from past history and from the requirements of the people that there would be any great tendency to effect such substitution, the note being a very much simpler form of currency, an easier form of currency to carry about and still more to send about the country. The facilities for remittance, for example, are very much greater in case of notes than in the case of gold coin.

411. The appetite of the Indian public for gold is one of the underlying facts of the currency situation, is it not?—Appetite not for the purpose of currency but for the purpose of hoarding or quasi-hoarding.

412. You agree, of course, that it would be a most undesirable consequence if such an alteration were to lead to a diminution of the use of notes unless it was very temporary?—But there is the other side of the picture and that is that in all probability there would be a very considerable gain in popularity for the note if it had printed on it the statement that it was payable in gold.

413. (*Sir Henry Strakosch.*) If we agree as regards the disadvantage of the sterling exchange standard or the gold exchange standard in fact, the previous system in this country is that the material upon which the rupee note in the form of a rupee coin is printed, is too expensive, it should be possible to assess what that expense would be. Now you have assumed in your plan under the sterling exchange standard that a reserve of 50 crores of rupee coin to secure the notes would be sufficient. Therefore the interest on these 50 crores of rupees would constitute the expense involved in maintaining the pre-war system. Do you agree to that?—I have not quite followed.

414. The expense involved, is it not the loss of interest on the reserve which you have to keep to secure the exchange value of that rupee note, i.e., the rupee coin? If it were full value, you would say no reserve is required to maintain it. Therefore the reserve that is required to maintain the exchange value of the rupee is the measure of expense involved under the old system?—I think I can agree to that as a logical statement but I am not sure I should not have to think very carefully to be sure that would contain the whole truth.

415. My point is this. If it is necessary to maintain the exchange value of the silver rupee in circulation, to hold 50 crores in sterling securities, then the expense involved under the old system, is the loss of interest that you are suffering by holding that reserve?—But we are not suffering a loss of interest.

416. You would lose interest on the 50 crores?—I think that logically that is so, except that you may earn interest on securities held in your reserve.

417. If this is correct, could you not assess the expense of a system of having notes printed on silver as the rate of interest which would be lost if you held the reserve in the shape of gold?—That is assuming that you would otherwise have an unlimited circulation consisting solely of notes printed on paper—or silver.

418. That the expense of printing part of your notes is assessed by the loss of interest on the 50 crores as conditions are to-day, because there is no difference between the note printed on paper and the note printed on silver, as both require an equally large reserve. If that is so, then the gold reserve which you are keeping is the measure of loss that you are incurring in having a note printed on silver? For these 50 crores then, the interest thereon at 4 per cent. is 2 crores. One might therefore say that the loss incurred by the system is Rs. 2 crores a year on Rs. 50 crores providing you are holding those reserves in the form of gold?—The loss simply amounts perhaps to the difference between the interest payable on an outstanding sterling loan of that amount and the interest receivable on short term sterling investments of the same amount.

419. I always assume that the reserve will approximately be the differenee between the bullion value of the rupee and its face value?—Yes.

420. (*Sir Reginald Mant.*) You said that you have to keep as large a reserve against the rupee note as against the paper note?—I assumed in answering the last question that that was so. Very nearly, I said.

421. But you only propose to keep one rupee in reserve against four?—It is only that part of the rupees in circulation which is liable to come out which constitutes a potential demand, it is not the whole of the rupees in circulation which require a reserve.

422. For further expansions of rupees you would only keep 25 per cent., so you don't really have to keep as large a reserve?—But you have to keep as large a reserve against that part of the rupees which constitute a threat to the stability of the exchange as you have to keep against paper.

423. (*Prof. Coyajee.*) But in the case of the notes you have also to keep another reserve, so there is no difference in cheapness or dearness because in the case of notes you have to keep a certain number of rupees? —That is because your rupee is unlimited legal tender. If your note is not convertible into rupees, you do not need to keep rupees in reserve.

424. But as it is, the notes are not so much cheaper because you have to keep a certain number of rupees against it as things are?—Yes. Sir Henry was isolating the exchange side of the reserve.

425. When the rupee is finally made a subsidiary coin with unlimited legal tender, shall we have anything like rupee securities?—The rupee security will be a gold security.

426. Because Mr. Denning in his memorandum on the gold standard says that the remainder would be rupee securities.—They would be rupee securities just as sterling securities are sterling, both may be expressed payable in gold.

427. But why call them rupee securities at all?—Rupee securities in the same sense as sterling securities are sterling securities. Rupees have become the general denomination for the Indian currency unit, but that does not necessarily imply a silver rupee.

428. (*Sir Purshotamdas Thakurdas.*) Since the time that the rupee became a token coin in India, it is only natural that the people's confidence in tho rupee should lessen. They know it is an overvalued coin and to that extent their appetite for getting its real worth is natural?—I think there has been a tendency all the time to hold another kind of metal rather than silver rupees. But at the same time there are many people who still regard the rupee as the same sort of rupee as it was in 1880, though it is difficult to make a very convincing statement on that point.

429. But irrespective of any statement, I was only asking whether it is not natural that people when they see token coin circulating amongst them would prefer for the purpose of hoarding something which is worth what they pay for it?—It is a natural tendency.

430. Then in that case, would not the first step be to convince the people that if they used their gold they will get it back whenever they want it and that need not be done by a more expensive token currency?—You are asking me, what are the reasons in favour of making the rupee convertible into gold. I agree that the strongest reason in its favour is perhaps that it would in time so convince the general public of the immediate convertibility into gold of any form or investment that they hold that there would be greatly increased confidence in the currency of the country and I hope a greatly increased tendency to use the opportunities for banking and investment intelligently.

431. I was trying to get at what is called the appetite of the people—of the masses—for hoarding gold as they get some surplus. I want to know whether in order to remedy that so-called tendency of the Indian people, an introduction of a gold currency would not directly show to the people that they can really get gold whenever they want and therefore they need not hoard it?—Yes.

432. The longer the Government keep the people away from getting it, the more the people will try to hoard it?—That is not a necessary logical consequence though I believe it to be true. I think it might be theoretically possible so to educate the people of India as to make them realise that their rupee note under the sterling exchange standard was so absolutely convertible for practical purposes into gold that their fears and attempts to hoard anything might disappear.

433. It is generally said that hoarding is a practice which is regarded as inevitable in India in its social and religious condition. Do you think it is susceptible of any change?—I should say that there has been and is an enormous change going on. Very much greater changes are needed and they are likely to be very long period changes in these matters but I look forward confidently to an increasing habit in India of using capital, if I may use the word, intelligently. But it is a very slow process and any means that can be found for accelerating it should also help to solve the great problem of teaching India to use her capital intelligently.

434. During the war period, gold was difficult to obtain, and it is true that since the gold prices went back the people have begun to make up for what they could not get during the war period?—The comparative cheapness of gold coinciding with a period of considerable prosperity owing to good monsoons has led to a very large demand for gold, particularly noticeable in the statistics of the last year. That, I think, from other evidence that we have, was the result of the comparative cheapness of gold and the comparative dearness of some other commodities, such as cotton goods, which the Indian people generally buy with their surplus. These resulted in a very considerable exchange of rupees in hoards for gold and in considerable new hoarding.

435. Do you think that this hoarding of gold to this extent just now mentioned would have taken place on the same scale at any rate if gold currency was in circulation? Or would it have made any difference?—I do not know whether it would have made any difference in that particular year. But I do believe that after a short time when the Indian people had discovered that they could get gold for currency without limit there would be a considerable tendency, instead of hoarding, to invest. It is more difficult to answer with reference to the particular year 1924-25, but as a general proposition I agree that after a short period the fact that the Indian people would have realised that they are able to obtain gold as currency and the rupee would be exchangeable into gold would lead to a very considerable tendency for them to invest rather than to hoard.

436. I am sure you must have heard during the last few years that people have begun to take gold bullion in small quantities of two or three tolas?—Yes, regarding the general operation of the gold market upon the small hoarder an ocular demonstration can be given to any visitor to the Delhi bazaar at any time, and might be instructive.

437. I want to know whether you think that this tendency to buy small quantities of gold would continue if gold coin was available in exchange for rupees—that is, with gold circulating as currency?—I think that instead of hoarding gold in the form of small bars, people would at first hoard gold coins.

438. When they have been satisfied that they could get gold whenever they want it?—The small hoard is not very easily distinguishable from the use of money in circulation; but one would hope that the savings bank and the cash certificate would make a much more real appeal to the very small investor. If the savings bank deposit and the cash certificate were expressed in terms of paying gold, it would be realised that gold could be had readily when required.

439. Gold sovereigns were available before the war fairly easily. There was no tendency to take small amounts of gold till 1914?—I believe that is a new tendency.

440. It has developed very lately perhaps by the cheaper price of gold?—I understand that is so.

441. Do you, therefore, think that it will be a fair conclusion to make that if gold was fairly easily available at the various Government treasuries, people may have hoarded less gold?—I think I have answered that really already in my broad statement that I am personally convinced that the easy availability of gold and the convertibility of the rupee into gold will after a certain interval have a very strong effect in reducing the tendency to hoard.

442. In that case, with a definite announcement of policy and an adoption of that policy, is it not likely that the people of India would reconcile themselves to the position that 'we can get gold whenever we want,' and the tendency to hoard may be very considerably reduced?—I believe so.

443. Regarding the loss of interest on currency, is not that loss borne by every country which has any currency at all?—Yes; gold in circulation, in theory, is a wasteful habit, which I hope has been finally got over in England, and has never been very prominent in America. Undoubtedly there is a loss, both in interest and in wear and tear, when anybody uses gold in circulation. At present there is no circulation of gold in England. When there was, it was a wasteful habit.

444. In the case of India, whether this habit is right or wrong, it will take a little longer time to have more confidence in the currency policy of the Government?—Is it confidence in the currency so much?

445. Currency policy of the Government, including the gold coin being kept in circulation in normal conditions?—I think one has to look a long time ahead before one can foresee the time when the whole population in India will be so educated as to prefer non-metallic to metallic currency.

446. I was thinking of the gradual improvement?—The improvement cannot be expected to be very very rapid.

447. It may take a longer time than it has taken in England?—England has been taught the lesson very quickly in a sense by the war.

448. (*Chairman.*) You tell us that the possibility of obtaining gold freely would, after a short interval, tend to reduce the hoarding habit, followed by an increase of the investing habit?—Yes.

449. I understand by your reference to a short interval, that there cannot be expected to be an immediate change?—One is in the region of pure prophecy, one can only express one's conviction and one's hope, which is based on such information and such intelligent examination as is possible. But I

have been led to the conviction by conversations with people like Marwaris and others, as well as by an examination of other evidence, that the fact that the rupee would be absolutely exchangeable for a gold coin, and the fact that our cash certificate would be expressed as payable in gold and the Government promissory note or the debenture of an industrial company would all be expressed as payable in gold, would give a tremendous inducement to the investing habit in this country. It is difficult to put it into figures. One assumes that there would be a large temporary addition to the demand for gold by India. If this policy were introduced that large additional demand would come rather quickly and suddenly on the world market. But the world might reasonably look forward, I think, to the gross demand for gold for India for the next 30 years not being increased; there will be a temporary increase in demand in the early years of that period, and thereafter a reduced demand.

450. We may, I suppose, look for a reduction in the demand of India for gold when such a change as that you are contemplating occurs in the course of the financial education of the public?—To a small extent one would hope that the change will come in any case; but one would expect that it will take very much longer without this special stimulus.

451. The desideratum being confidence on the part of the public in the stability of the value of the currency whch they are using?—I attach great importance to confidence on the part of the public in their currency, and also to the currency system being one which is comparatively easily intelligible to them. That is, they are coming to realise that this rupee is less than a full value coin, and that is about as far as you can expect to get our Indian currency system, as it now is, understood by the people generally, and since that is understood there is a natural tendency to prefer something else for the rupee.

452. We have been passing through a period of abnormal fluctuations in the value of the currency. What would be the effect upon public confidence in its value of a visible return to and maintenance of the stability of the currency through exchange on the exchange standards?—On the one hand the instability of the currency during the last 10 or 12 years has undoubtedly tended to cause distrust of the currency. On the other, that has been accompanied by a period of very rapid development in many directions of the banking and monetary facilities in India, including a considerable industrial development, and statistically a very large increase in the amount of the investments of the Indian people. For example, Government of India rupee loans outstanding on 31st March, 1914, were 145·9 crores, and 370·8 crores on the 31st March, 1925. They were nearly trebled, and this is in addition to the cash certificates. So there has been development going on. In addition the cash certificate system, which did not exist in 1914, has produced a total of 17 crores; so there has been a development going on.

453. We have at present realised an increase in banking facilities; statistics show an increase of the investing habit, and, as you have first told us, you have the growth of the industrial system giving increased investment facilities for the savings of the public. We might contemplate an additional factor of stability by the establishment of a firm exchange standard system. Might not all these influences be expected to have a powerful effect, leading to the good results which you say are the results to be desired?—There is such an immense possibility of advance. If you consider the size and the population of India and its potential resources, while one might confidently say that some advance would take place anyhow, it will to all appearances be a slow one in comparison with the immense possibilities that exist, and so long as that is the case there do seem to me to be very strong arguments for a bold policy of assisting and stimulating that development by giving to the Indian people an absolute convertibility of their currency into gold. I would expect that to hasten the process by possibly a couple of generations. At the same time one is naturally here in the region of rather mystic prophecy.

454. This is an appropriate place to ask a question which Prof. Coyajee asks me to put, *viz.*, would 10 years suffice for the introduction of the gold standard and the financial education of a continent? —10 years would hardly even suffice for the financial education of any one individual or any country or any people. 10 years was put down in that memorandum as the suggested period over which the iutroduction of a new system might be spread, not with the idea that the education of a continent would be completely achieved but as a minimum period in which it would be possible to carry through efficiently the changes in machinery and methods and meet the practical difficulties that the change involves. One would want another 10 or 15 years before one would see very appreciable results from the increased confidence.

455. (*Prof. Coyajee.*) What was implied in this question was that in order that gold circulation should continue in India some of the earlier demand for gold should be saturated as it were, and the question is whether 10 years would suffice for that process of saturation?—The process of saturation is not I think within the power of any individual to encompass. The difficulty of the situation is that the suggestion of a gold currency, of making the rupee absolutely convertible into a gold currency, involves some kind of public proclamation that the silver rupee is in process of being dethroned and may involve an enormous demand for gold by the holders of rupees and silver generally. I think that the danger is not so much that 10 years might not suffice for the saturation but that the immediate rush to obtain gold in place of silver might be rather difficult to manage. I think that 10 years would probably suffice. The danger is that it might happen even more quickly. The new hoards will be gold and not silver, but one would hope that the absolute value of the new hoards would be less and that rather more would be banked and invested.

456. (*Chairman.*) A period of 10 years is required, according to the scheme outlined, for the complete introduction of the scheme, as I understand it. During that period you contemplate with certainty a continuous and enlarged demand for gold. After that you hope that the educative effect of the new system will begin to tell and that there will be a gradual realization of the benefits in the return of gold?—You may say for certain that there would be a less absolute demand for gold after the change than there is now. The whole question is how much less and how quickly it would grow less.

457. In broad outline, the situation is that there is the certainty that there will be an immediate demand for gold and that you hope thereafter the demand will diminish and the gold will be returned?—I would say that there are two certainties. One is that there would be an immediate and large demand for gold, and the second is that there would be an absolute diminution in the demand for gold thereafter but that it would take a long time before that absolute diminution rose to very large figures.

458. (*Sir Henry Strakosch.*) You said, Sir Basil, that the system of having gold in circulation is an extremely wasteful one and no doubt you would also agree that the ideal function of gold in any currency system is that its use is confined to international payments. Do you consider that gold in circulation internally is of any great value for external payments in times of stress?—I must again draw a distinction between gold in circulation and gold in hoards. I contemplate that there will be very little gold in actual circulation in India. Gold in circulation is only available for meeting the demand for foreign exchange, external exchange, in so far as the currency contracts during that period and the contraction is in the gold portion of the currency. It is available in a way that silver is not available in that it is gold that comes back and is immediately

exportable, but undoubtedly gold in circulation is not much use in a time of crisis unless you can do as was done for example in the United Kingdom and in Germany during the war, that is, rely upon the patriotic intelligence of the people and secure a sudden change in their habits.

459. In India the gold actually in circulation will be of comparatively little value for the purpose of the maintenance of exchange. The object of the question is rather to elucidate whether in these circumstances, Sir Basil thinks that during the earlier period of the introduction of the system, it would be as necessary to hold substantial gold reserves to maintain the exchange value of the rupee as under any other system, such as a sterling exchange or gold exchange standard?—The introduction of the system necessarily involves the liquidation of a good part of the existing reserves and it probably involves recourse to external borrowing. Therefore during the period of transition I think that if a period of stress arises it would involve additional external borrowing.

460. The borrowing being for the purpose of making external payments for the purchase of silver, which function at present is performed by the reserves?—I think the extra gold would be in diminution of India's external balance.

461. But if that crisis in India is accompanied by a crisis abroad, would you not think it would be difficult to borrow at that period; would it not in the circumstances be advisable to hold a reserve in gold and gold securities?—I think some reserve would have to be maintained but in view of the fact that you have to borrow abroad anyhow, you would try to postpone your borrowings though of course not absolutely till the last moment, by letting your available reserves run down to a low point.

462. So that the gold required to introduce the system would be, first of all, the gold which will go into hoards in substitution of the present silver hoards, your silver ornaments, etc., and then in addition to that, the gold needed to maintain the exchange value of the rupee especially during the initial period in so far as your existing gold reserve is insufficient?—Yes.

463. You say that the central aim must be to educate the people of India to instruments of credit? Now we know the predilection of the people of India for precious metals and also their ignorance of the method of saving in the form of securities. You refer to cash certificates which are issued in this country, which I take it are something equivalent to the war savings certificates at home.—They are very nearly identical. About 17 crores are outstanding at the present moment.

464. Would you regard a system under which the public demand for gold and its ignorance of investing habits might not be met by offering to the public cash certificates of fairly short currencies payable in gold? You actually kill two birds with one stone; one, you satisfy the prospective desire for gold, and, two, you incidentally educate the public to buy securities which would yield them interest rather than hoard gold?—I think if that was the sole contribution to the problem, you might kill a third bird, namely the cash certificates because they are payable on demand. There is no interest paid during the first year and an increasing rate of interest from after the first year. It is absolutely encashable any time after issue at par. The rate of interest runs up by degrees to 6 per cent. at the end of the present maximum period of 5 years. The cash certificate that you contemplate would have to be not a cash certificate because that implies a certificate for cash deposited but it would have to be some form of a bond.

465. Why not have it in the form of a very short term bond?—Of course a short term bond is not what the very small man would hold because in the case of the cash certificate he can at any moment get cash for it and the bond is a thing for which there has to be a market.

466. But he would be able to get money from moneylenders upon a certificate which matures in say six months or a year?—God save us from the moneylender dealing in the cash certificate! No doubt however it would be most desirable if we did introduce the gold standard to accompany its introduction with a very well thought out campaign for encouraging investment.

467. Would it be necessary to do that—would it not be equally possible under a gold sterling or gold exchange standard?—We are of course doing what we can already. There are difficulties in India about the sort of propaganda campaign that there was for cash certificates in England, and still more in America. But in any circumstances I hope that the authorities in India will be always doing their best to encourage investment, and the introduction of the gold standard would I think give an opportunity for a specially vigorous and I hope a specially successful campaign.

468. I may say that the essence of my suggestion was that this certificate should be payable in gold so that the certificate holder would have the special privilege of cashing it in gold?—It might be possible I think to take advantage of the implications of that idea by issuing a gold bond possibly of some sort,—a gold bond payable five years hence as a preliminary or accompaniment of the first stage of the introduction of the gold standard; you might by that means reduce your immediate demand for gold, but I think by itself it would not attract many of the people who are now in the habit of hoarding gold.

469. (*Chairman.*) Sir Basil, I want to take you on to the state of affairs which would exist when the full gold standard was established. That is the stage three, if I remember right, of Mr. McWatters's memorandum. I am going to commit the unpardonable sin of repeating a question because I am not quite sure whether I made myself clear when I asked it at an earlier stage of the examination. In stage (III), para. 10, of Mr. Denning's memorandum on the Gold Standard for India, it is said "after a period fixed by statute (say, five years) the liability to give gold coin in exchange for notes or rupees and also for gold bullion on payment of a seigniorage should be imposed" and then on stage (IV) "after a further period fixed by statute (say, five years) the silver rupee should be made legal tender for sums up to a small fixed amount only (say, Rs. 50)." Is the liability referred to in paragraph 3 to continue after the commencement of period 4 or not?—Yes certainly. But it would no longer be in exchange for all rupees; it would be really in exchange for notes. The rupee would be limited legal tender only and the liability would only be to give gold in exchange for notes.

470. They would not then be able to bring an unlimited amount of rupees and require gold?—That would not be a legal tender, except for a limited amount.

471. What would that imply as regards the obligation of the Bank to give gold for rupees?—It would presumably have to give gold for rupees up to Rs. 50 only. The rupee would be in the same position as the shilling in England. It is more a technical distinction than an actual one except that there might arise occasions as they do in England when subsidiary coinage is redundant and when other Banks than the Bank of England find they have got more accumulated than they need and have no means of getting rid of it.

472. You cannot in England demand gold for silver for any amount small or large?—You cannot when the application is for a large amount; you can obtain gold for export on demand on presenting legal tender for the minimum amount required to pay for 400 ounces.

473. I think I am right in saying that there was never an obligation on the part of the Bank of England to give a sovereign for 20 shillings silver?—No, not now. There would have been perhaps before the war; it was up to 40 shillings.

474. That is the extent of the liability which you contemplate continuing, after the inception of the final period here?—Yes.

475. Now, again dealing with the period after the full introduction of the gold standard, there is a seasonal demand, as I understand it, in India for actual silver rupee coins for the financing of certain crops, is there not?—Yes.

476. Do you contemplate that the seasonal demand might be converted into a demand for gold for the financing of these particular crops?—It might be to some small extent.

477. But I imagine the currency requirements are such as regards the amount of the payments and the habits of the cultivators that rupees are likely to continue to be required in substantial amounts seasonally for the financing of certain crops?—Yes.

478. In view, then, of there being an excess demand at certain times of the year for rupees in some form or another, do you think it would still be necessary for the Imperial Bank to keep a stock of rupees?—In the same sort of way as the Bank of England has to keep subsidiary coin in England.

479. In the same sort of way as regards the nature of the demand; but would it not be very much larger as regards the magnitude of the stock which it will be necessary to keep?—The difference perhaps between the maximum demand and the minimum demand will be greater than in England.

480. Can you give roughly the order of the figure? It appears to me from such figures as I have been able to see that you can take the maximum additional seasonal demand for silver rupees as not exceeding six crores?—I have asked Mr. MacWatters to prepare figures of the fluctuations and the difference between the maximum and the minimum demand.

481. Those figures would show the stock of coined rupees which it would still be essential for the Imperial Bank to keep in excess?—Yes, that would give you some idea of it.

482. Will you clear my mind on a further point? It is really supplementary to some questions which have been put to you this morning by Sir Henry Strakosch. Supposing that the rupee has ceased to be legal tender except for small amounts, and supposing that there is still in circulation some 150 crores of rupees, would it not be the case that a part of that large value in rupees would still be available for contraction, if I may put it so, as payment in respect of imports, and therefore would it not still require, even though the rupee ceased to be legal tender, some provision for the protection of its exchange value in the form of sterling reserves or gold reserves?—So far as I am aware it is not the practice and never has been the practice in England to keep any kind of cover against the subsidiary silver coins in circulation. I am not sure that I see any reason why it should be necessary to do so in India.

483. Are we not here dealing with a value which has quite a different order of magnitude from the value of the silver coinage in circulation in Canada, in England or in any other European country?—Proportionately per head of the population, no. I have not got exact figures for the silver coin in circulation in England, but I believe just after the war it was something between 50 and 60 million sterling, which was more than £1 per head of the population. The figures suggested here is from 150 to 200 crores, which is about 5 rupees per head of the population.

484. Your reply to my question would be, if I follow you, that that rupee currency in circulation would not be capable of contraction?—Not to an important extent.

485. You are of opinion that it will be possible to disregard that store of value altogether as requiring any protection from the point of view of exchange?—Yes.

486. (*Sir Henry Strakosch.*) Continuing that particular aspect of the question—when the full fledged gold standard is in operation, would it be necessary nevertheless to hold reserves to protect the exchange in the same way as the Bank of England held gold reserves when we had a full-fledged gold standard in England and when gold was in circulation there?—Certainly—against the notes in particular.

487. And that reserve would have to be a substantial reserve because the position of India is, of course, a totally different one to that of the United Kingdom as a big creditor nation which kept its reserves deposited in other gold standard countries and could draw upon them as necessity arose?—Yes.

488. In India the position would be different, because India is mainly a borrowing country?—Yes.

489. And relies on a regular influx of capital from abroad?—No, I am not sure if India really relies on a regular influx of capital of any large amount from abroad. There has been a very great development in the last 10 or 15 years. We have not borrowed for purposes of Government expenditure of any kind now for 2½ years, and we have during that period financed very large sterling expenditure on capital account, apart from the revenue account, in addition to making small repayments in the nature of sinking fund repayments, of our sterling liabilities. I may mention, as an example, that we took over the G. I. P. Railway, and last year I think we found 2 to 3 million sterling to pay off the English stockholders. We did not borrow outside India for that; so that, though there has been a considerable influx of external capital into India in the past, and no doubt is still coming, I do not think it is true that India relies, in order to achieve equilibrium in her balance of payments at the present time on imported capital from abroad. She normally has a very large surplus of exports over imports, and if she used that surplus for investment at home, *i.e.*, in India itself, instead of for purchase of gold, she would certainly not have to rely at all on external capital. Indeed she might within quite a short period be a lender abroad rather than a borrower—which is in the future, not at the present time. At the same time I would not agree that she relies to any large extent on imported capital at the present time.

490. At what figure would you assess the reserves necessary to maintain the exchange value of the rupee supposing she went over to the gold standard?—I have endeavoured to give the figures in my memorandum.

491. You merely say that it may become necessary to borrow abroad without saying what figure?—No; I think in para. 25 of the memorandum entitled the Indian Currency System, I suggest a constitution for the reserve on the new basis. It is really the second of those two tables—based on the assumption of a circulation of 189·5 crores.

492. So that it would be correct to say that in order to introduce the gold standard it would be necessary to provide:—(*a*) an amount sufficient to saturate the country with gold for hoarding and currency purposes, and (*b*) a reserve of 89·5 crores to assure the exchange value of the rupee?—Yes. But I would like to be sure that we mean the same thing by saying "saturate the country". I would not suggest that it will finally saturate it and that it will be incapable of taking more gold in certain directions thereafter. But I think by saturation you mean, and I mean, converting into gold these hoards which are at present in silver, and are likely to seek conversion into gold in the event of such transition taking place.

493. And secondly?—Sufficient gold assets in reserve to establish a safe reserve under your new currency system.

494. And thirdly, to give the country sufficient gold coin for purely currency purposes?—Yes. That, I think, is included in the figure that we originally put forward. That is an outflow of 200 crores of silver rupees and a maximum extra demand for gold of £103,000,000.

495. So that if you were to add the 89·5 crores to the 200 crores just mentioned, the total amount needed to set the gold currency on foot would be 289·5 crores of gold, from which has to be deducted what is available at the present moment in the form of gold or gold securities?—I do not think you can add those two figures. 90 crores of silver is at present in our reserves.

496. I am speaking of the need for gold, irrespective of what is now held?—The extra gold required is, I think, set out fairly clearly in Mr. Denning's memorandum.

497. (*Chairman.*) It comes to 110 crores against hoards and 27·2 crores, being the difference between 56·9 crores and 29·7 crores, giving a total of 137·2 crores?—Yes. That is £103,000,000.

498. (*Sir Henry Strakosch.*) Is it suggested that 200 crores would be needed, 100 crores plus 90 crores from the silver rupees in the paper currency reserve?—The estimate of the amount required, which of course is necessarily a good deal a matter of guess work is the replacing of 100 crores of silver rupees now in hoards by gold, an additional 10 crores of rupees now in circulation to be replaced by gold; that gives you the figure of 110 crores. In addition to that, you need such gold as may be required to bring the present holding of the reserve in gold, which is at present 29 crores, up to whatever figure you decide is to be the minimum in the new reserve which, I have suggested, should be somewhere in the neighbourhood of 40 or 45 crores.

499. May I, therefore, put it this way? Estimated requirements at 110 crores plus 89·5 crores, less the amount held in the reserve?—No. 89·5 is not the amount of gold that I suggest is necessary for the new reserve—it is the amount of gold and sterling or other gold securities. I estimate the requirements as 110 crores plus—to take the second of my two tables at page 9—45 less 29·7 crores. Mr. Denning gets rather a higher figure simply because he asks for a slightly larger amount of gold in the reserve than I suggest. But, if you take his figure you get 137·2 crores, which is 103 millions sterling.

500. Taking your figure of 110 crores, that compares with an estimate of hoards at present in the shape of silver rupees or metal of 200 crores?—One of those hoards being in the hands of the Government of India.

501. You mean you include in the 200 crores the 90 crores of the Government of India?—Yes.

502. (*Chairman.*) So that your estimate of the total hoards outstanding would be very much below 200 crores, would it not?—On the figures that I gave yesterday, I think they were a maximum of 400 crores for the total amount of silver rupees absolutely out, a more probable figure of something between 300 and 350, and a minimum figure of 150 as the amount required for circulation in any case, the more probable figure approaching 200. If you waive from that 350 crores, the 90 crores in the hands of the Government at present in silver, you get 260 as a reasonable sort of maximum for the amount you have got to deal with; and, taking from it a further 150 or 160 crores as the amount in circulation, you get a rough figure of 100 for the amount of silver hoards there is any real probablity of having to deal with—and that probably a high figure. Mr. McWatters will tell you; the figures are extremely difficult to obtain. But 400 is, I think, an absolutely safe outside figure for the maximum in circulation, including hoards at the present moment.

503. Then you have whatever element of uncertainty there is between the 400 crores and the total maximum quantity of 600 crores?—Yes.

504. The difference contains the uncertain element of what has been melted down by the public?—Yes; but I have not got the exact figures. I think that the amount that has been in to be melted down by the Government brings the maximum total of rupees in existence at the present moment down to somewhere near 450. Then it depends how much has been melted privately and how much below that figure you could go.

505. (*Sir Henry Strakosch.*) So that you estimate the total amount of gold required would be, expressed in sterling, something like 80 million sterling?—103 million, according to Mr. Denning's figure. Mine would be just under 100 millions.

506. May I ask you what effect you think a demand of 100 million sterling upon the gold reserve of the gold standard countries would have, because that is the only source the gold can come from?

507. (*Chairman.*) Can you keep the question for consideration at a short stage later—in case there is anything more to be explored on the question of the reserves—because that raises rather a specific topic? I should just like to put it to you in this way, Sir Basil, if I may, that under the present system, under the present constitution of the reserve, and assuming throughout a present circulation of 189·50 for the note issue, the total gold and sterling held is 109·7 crores, is it not?—Yes.

508. Under Mr. Denning's final constitution of the reserves in the second stage the total gold and sterling held would be 99·5 crores?—Yes.

509. Under your constitution of the reserves the total gold and sterling held will also be 99·5 crores?—Yes, but the amount of gold rather less and the amount of sterling securities rather more.

510. To summarise our discussion, why is it, in your opinion, possible in starting the new system, to make that reduction in gold and sterling held?—At that stage the assumption is that the Government has got rid of all liability for the overvalued rupee, that you have drawn the 100 crores of rupees out of hoards and replaced them by 100 crores of fully valued gold. Any tendency for currency to come out of hoards into circulation or to seek export is therefore no danger to the exchange value, except in so far as in another connection it may tend to gold inflation, which is not a question in point. But anything coming out of hoards comes out in the form of fully valued gold and requires no reserves to protect it. It is valuable in international currency in any centre that is wanted, and no reserve is wanted against it, whereas at present you need a reserve against the silver in those hoards.

511. You look, then, upon the gold in hoards as it were as an additional reserve?—It is so long as it is there; and if it does not come out in any form, it is not a drain.

512. (*Sir Henry Strakosch.*) If contraction has to take place and if gold won't come out, then notes will flow back in greater volume than otherwise?—Yes.

513. So that contraction would be effected through the notes which would have to be converted into gold and exported?—Yes, and you are keeping a reserve against your needs under my proposal; only it amounts to 20 crores less than one would regard as necessary to keep against the notes *plus* the rupees under existing circumstances.

514. If it should happen that the issue of gold coin were to reduce the note circulation of the country, would that not produce an impairment of the elasticity of the system? Would it, then, not be necessary to rely upon gold imports at the busy season in order to provide the country with the gold that is needed as additional circulating media?—I contemplate, that in the existing circumstances, India being what it is, whenever there is a good monsoon there will be imported gold based on additional circulation.

515. But a permanent contraction of notes in itself would make the system less elastic?—I think it would.

516. (*Chairman.*) Mr. Denning in his memorandum proposes the introduction of the system by various stages. He estimates that the total maximum demand for gold to replace silver in hoards during the first stage would be fifty crores?—Yes.

517. I want to put this to you. Might not the commencement of the policy result in an acceleration of the demand for gold beyond what is here allowed for?—Yes.

518. And,—just to complete the picture—on the other hand a return of silver from the hoards which would upset all these calculations as to the gradual incidence of the cost?—I do not think they would seriously upset the estimates of the cost to Government; so far as the Government of India is concerned the suggestion is that an addition of 20 crores of gold to the existing holding of 29·7 crores, making roughly 50 crores, would be enough for the Government of India to start with in order to meet the obligation which it had undertaken, namely, to sell to any person who makes a demand at the Bombay Mint, gold bullion in the form of bars. If the demand were larger, as it might very well be, it would, I think, necessarily be at a time when there has been a good monsoon; and it would necessarily follow that exchange would rise to the gold import point and gold would be brought in which might either go to the Government in exchange for currency or might be sold to the bullion dealers direct. In the latter event it would not affect the Government directly, and in the former event the Government would be paying for it in notes.

519. You are protecting the Government of India from an immediate demand on their reserves of gold. But if you regard the matter from the point of view of the demand made by India as a whole upon the world's supplies of gold, have you any means of preventing the whole of the demand in the case of a contingency such as I have referred to being met within a short period?—No. It has been suggested, I think, by Mr. Denning just as a rough start that the demand for gold would be £15 millions at the initial stage, £35 millions within a year and the remainder over the whole period of ten years.

520. What I am suggesting against that is that the whole of that demand might be piled upon you almost on the announcement of that policy?—The whole demand might be piled on India. It would not, under our proposals, involve a breakdown of the Government of India's arrangements for meeting it. It might undoubtedly involve a strain on the exchange position and the necessity for additional sterling assets or additional external credits; but I think the point of the question is that, whatever the position of the Government of India, the demand on the gold market of the world might come very quickly.

521. That is so?—I think the only suggestions one has for preventing that would be something of the sort that we discussed before, *e.g.*, the issue of gold bonds: I entirely agree that we cannot protect the world under such circumstances against the demand coming very quickly.

522. And in the same way the burden upon the world's silver market also?—Not directly because we contemplate that in view of the enormous quantities of silver to be liquidated, nearly 700 million fine ounces at the maximum, it would be out of the question to attempt to do that all at once; and the liquidation would have to be spread over a long period: it will be largely in the hands of the Government of India.

523. How could the Government of India control liquidation by private sellers of silver other than rupees?—I doubt if they would exist in very large quantities; the demand for silver other than in hoards, is largely for bangles and anklets and things of that sort. I have never heard of anybody having a large hoard of silver bullion.

524. Is it the habit of the people of India to hold part of their savings in the form of personal ornaments of silver?—Yes. That is where a large proportion of the precious metals that come into India goes to.

525. I am contemplating that, taking alarm at the value of silver as a result of the announcement of this policy, there might be an immediate large throwing out of this stored value on to the silver market?—I think the tendency would probably be the other way. If the effect of the Government of India's decision was to reduce prices of silver in India and all over the world very materially, the demand for silver would probably increase owing to its cheapness.

526. That must depend on the somewhat psychological question whether a silver band is looked upon as an ornament or as a hoard of value?—I have no doubt that it is both. But the number of silver bangles that can be bought at any one time by the average individual is so small that they would not usually have enough to convert into a gold bangle even if they wished. That I think is a question on which the Commission might get much better evidence from other people than myself. I think the tendency of a fall in silver prices would, so far as I can judge the psychology of the situation, be rather to increase than to decrease the internal demand for silver in India. Everything would of course depend on the nature of the crops of a particular season.

527. With the somewhat surprising result, arguing merely *a priori*, of making an announcement, so obviously largely affecting the value of the substance, to increase the demand for it, when the substance is regarded as a store of value?—I think it is regarded as one, two or three silver bangles or so many tolas of silver rather than as worth a particular number of annas, once it has reached that stage.

528. (*Sir Henry Strakosch.*) Would not the effect be that the first shock of the announcement would lead to sales and that the purchasers would only come when people believed that silver had reached bottom and was really cheap?—There is not the least doubt that it would have a very serious effect on the silver market.

529. Which effect would be brought about by people desiring to exchange their savings from silver into gold?—As I say I do not believe myself that there would be any considerable selling of silver other than rupees in India.

530. (*Chairman.*) Continuing to deal with the situation that would arise on the establishment of a Gold Standard, you refer to the possibility of making arrangements with the Central Banks in order to avoid a disturbance of the distribution of the world's gold supply and the immediate demand for the actual metal. What is the nature of the arrangements which you have in mind?—Well it is obvious that a decision of this importance in relation to gold in the world could not be taken and acted upon without consultation with the Bank of England and the Federal Reserve Board of the United States. It is most important that it should be taken in consultation in order that such steps as are possible may be taken to prevent either a very large appreciation of gold or disturbance in the gold standard countries. My feeling about the matter is that just as in theory, an Exchange Standard for India with no gold in circulation would be cheaper for the Indian people, but that psychologically it would not in the end be of such benefit to India as a gold currency system because of the absence of expert currency knowledge among the majority of the population, so the sudden appearance of an excess demand of 100 million on the gold Reserves of the world would, owing to the attitude of the mind of the average man in the City of London or in the United States, be a very severe shock and could not be met unless something had been done to educate that opinion, but that if that opinion were reasonably educated there would be very little difficulty so far as the experts were concerned, in devising arrangements which would enable the gold reserves of the world to spare £100 million. I have not got the exact figure of the amount of gold and gold certificates in the United States, but I believe, it is a fairly large figure, and I think it is commonly agreed that at the present moment there is a very large excess of gold, apart from gold certificates, possibly as much as 500 million dollars in the Federal Reserve system of the United States which would be enough in itself to meet this demand, if the Federal Reserve Board were willing temporarily to reduce the proportion or were willing to get the

gold certificates out of circulation. Similarly I believe that the Bank of England authorities would agree that if popular opinion were more educated, a reserve of £150 million or £160 million is unnecessarily large. And what I contemplated was that there should be negotiations between the two and that after arrangements had been made for minimising the shock there should be arrangements made for temporary credits for the Government of India either direct from the United States or through the Bank of England so as to ensure the withdrawal of £100 million from the gold reserves of the United States and England in a way which would not upset gold prices.

531. I feel a little difficulty in apprehending what the arrangements to minimise the shock would be, and, in the second place, since what you require to put the standard into force is gold, of what benefit any arrangements for temporary credits is going to be unless except in relation to supplying you with the sterling necessary for the Government payments in London?—Theoretically, the Government of India could set to work to meet the first stage by using it up. It has got available 109 crores of gold and gold securities. It could theoretically proceed to convert the greater portion of those securities into gold during the first stage. Naturally its action in doing so would have a very severe effect on the gold reserves of the United Kingdom and it could hardly take that action until it had come to some agreement with the authorities responsible for those gold reserves.

532. The agreement would be in the nature of an announcement to those authorities as to what you are going to do, so that they might take action to meet the situation?—It would, as I contemplate it, be an agreement to assist the situation by allowing India to borrow temporarily in London and New York.

533. It would be apparent to those from whom the credits were obtained, would it not, that they were obtained for the sake of allowing India to draw gold?—Yes. After all, it was exactly what was done by the German Government when it issued its two large loans in 1924. It obtained thereby a call on the gold reserves of England and America and arrangements were made for assisting the supply of that gold to Germany without disturbing gold prices in the United States.

534. Considering the matter entirely from the point of view of India, and considering what the attitude of those with whom India would have to bargain would be in the event of such negotiations being undertaken, what will be the inducement to the authorities of the world's gold centres to induce them to facilitate the flow of gold to India under those conditions?—India's worst argument would be a threat that she would convert the 80 million crores of sterling securities into gold. That would be one inducement, I think, on the part of those concerned to collaborate in order to prevent any action of that sort from upsetting them. But the other inducement and the main inducement would be I hope, that they would be convinced that in the interests of India and of the world in general, the establishment of the gold standard was over a long period going to secure such improvement in the general economic condition of India and its position as a purchaser and partner in the world's trade and commerce as to make them willing, taking a long view, to assist the process of securing a gold standard for India. I recognise that it is a startling proposition and that there are very formidable difficulties in the way. But I do express my own personal opinion that with goodwill on the part of the various authorities concerned, the problem is one which really might yield to treatment.

535. You express the view in the final paragraph of your memorandum, paragraph 30, "It remains to consider the second question. Can the transition be effected without such a disturbance in the gold and silver market of the world as will threaten or destroy the utility of gold as a standard of value? If the effect of a decision to attempt the change to gold in India is going to be to upset the gold standard in the United States of America or in Europe, India has clearly nothing to gain by making the attempt. Even if the change is likely to cause an appreciation of gold by as much as, say, 25 per cent., India must hesitate before risking such an upset in her own internal prices, as would accompany a fall by 25 per cent. of world prices ", and you add that you do not feel confident to pronounce a decision on this point?—No.

536. I am sure the Commission would be most anxious to hear whether you have any provisional view as to what likelihood there is of so serious an upset as that to which you refer here taking place and what influence that will have upon your opinion as to the desirability of the policy?—I feel convinced that there is a serious risk in a matter of this sort unless there is some preliminary agreement for co-operation among those concerned. But I add that, in my opinion, it ought not to be impossible to arrive at some such agreement, and that, taking an objective view of the whole position, the gold reserves of England and the United States—particularly the United States—could spare the gold required without any appreciable effect on gold prices, if the public opinion in those countries was not unduly shocked.

537. So that the general effect of that is that these are considerations upon which further knowledge and assurance is necessary before anything can be decided as regards the balance of considerations for and against?—Yes. From India's point of view, I believe that, in spite of the real objections to the use of gold as currency, it is impossible to get such good results so quickly for the economic position and development of India by any other system than a gold standard system on the lines suggested, but that the transition to such a system is a big problem. India would have to pay a little bit more in her budget during the transitional period and for, say, a generation, but not, as I think, an impossibly large additional charge. The world would, somehow or other, have to be convinced of the possibility of finding the extra gold required for the transition period before it would be safe for India in her own interest, quite apart from the general interest of the world, to embark on such a plan. But I have expressed my own personal conviction that I do not think it ought to be impossible to convince the world that this can be done.

538. The world for this purpose being represented by the authorities in London and New York?—I believe that those authorities can be persuaded in so far as they are personally concerned in a short time. But they are faced with the necessity of dealing with a public opinion which has only hazy ideas on the subject of the gold standard and of the amount of gold required, and that shares the rather common view that a gold reserve is there to be locked up. And it is the difficulties of educating that opinion that would give pause to the authorities—not that they really believe that it is impossible. In the same way, as I said before, that India could probably get as good results without this system, if public opinion in India were capable of realising it, so I believe that India could get this system without damage to the rest of the world if public opinion in other countries could realise that it could be done.

539. (*Sir Henry Strakosch.*) I should like to ask one or two questions. Sir Basil Blackett mentioned that only the other day a good deal of gold migrated from America to Germany without having any appreciable effect, and that in pre-war days it was the custom to go freely backwards and forwards. I should like to have his view whether, when the time came to approach the Bank of England and the Federal Reserve Board, their decision to help in

establishing a gold standard in India would be influenced by the consideration whether the gold flowing into India will, when it has gone there, remain available as part of the world's gold currency reservoir; if they believed that this gold going out to India did not go into the gold standard reservoir of the world, whether in these circumstances, they would not be very much more reluctant to part with the gold because they would know that that gold would never come back for monetary purposes?—The authorities would certainly be very much influenced by the obvious fact that this hundred million is required in the first instance to go into hoards; but I hope they would also be influenced by the consideration though one cannot put it forward as a fact, but the consideration that it is very probable that, taking a long view, the result of this change would be to diminish the drain on the world supplies of gold within, say, 30 years, that it would diminish the drain immediately once the first operation of a hundred million had been carried through, and it would diminish it to an increasing degree year by year, so that over a period of, say, 30 years, the amount of gold that has gone into India would not have been greater under the new system than under the old; only in this case it would have been spread more in the first five years and less in the last 25 years. But I do not think it would be a consideration for the authorities that, taking a long view, this would remove from among the dangers which always face a gold standard in gold standard countries the threat of an absolutely unlimited drain of gold into India.

540. I should like to ask Sir Basil Blackett whether he thinks that the future production of gold is likely to keep pace with the economic development of the world and therefore the increased demand for gold for monetary purposes. In that connection I should like to remind him of our days at Genoa when that very question was being thrashed out?—I have been dealing with other questions in the last few years than the production of gold in the world, and I do not think that I am really in a position to give a view of any value in reply to the question especially when put by an expert like Sir Henry Strakosch, who probably could give the Commission a view of much more value.

541. I wanted to remind Sir Basil Blackett that it was, I think, then agreed that to keep pace with the economic development of the world, the yearly gold production has to amount to about 3 per cent. of the whole stock of gold money in the world and that that amount was worked out at a figure of about 110 million sterling per annum?—But that is assuming a drain to India of the same sort of proportions as had previously been in existence. If this change is carried through, one anticipates after it a reduction in the demand. It is an anticipation of the demand for a hundred million by a period of about, on the average, 20 years, and it surely does offer a possibility of economy of gold, to get India advanced a stage towards having a banking and monetary machinery, that will be more economical in regard to precious metals than her present habits are.

542. Was it not the proposition at Genoa that because the gold supply of the world was insufficient, countries should adopt the gold exchange standard for the purpose of economising the use of gold for monetary purposes?—As far as I remember those discussions, the subject of economising the use of gold in case it was insufficient was one of the big subjects discussed. But then the most important point underlying those discussions was not so much the economising of the use of gold as the attempt to stabilise the gold commodity value; so that in the event of an extra demand for gold, such as I am now suggesting India should make, the co-operation of the central banks of the world would secure that it did not cause a serious appreciation in gold, and, similarly, if there were some large new supply of gold from any quarter, it should be so absorbed as between the various gold using countries of the world as to prevent a rise in gold prices. I do not remember very particular stress being laid on the insufficiency of the world's gold supply except, I think, by Professor Cassel.

543. But are not those two questions almost inseparable? If my memory serves me right, the fundamental idea of the Genoa resolutions was that there was likely to be a scarcity in the supply of gold and that in order to maintain the purchasing power of gold at a stable level, it was necessary to economise it and that as a means of economising it, the introduction universally of the gold exchange standard was advocated?—Certainly; that was one of the purposes in view. I think, speaking for myself, I laid more stress on the importance of stabilising the commodity value of gold than on the economising of it; because I was not convinced in view of the history of the past, that we could say that there would be or would not be a sufficiency of gold. The fear of a scarcity of gold was in view of the very much larger amount of credit structure built on the gold during the war. That threatened the possibility of a serious contraction afterwards. To that extent there was a suggestion that it was important to economise gold; but I would suggest that in the Genoa resolutions, the suggestions for co-operation between the central banks of the world are very much germane to the subject we are discussing and that it was for this sort of purpose the conference in question made their suggestions, and that we are pursuing our ultimate purpose, namely, an international exchange standard, by suggesting for India that she should advance towards that through the stage which, I fear unfortunately, cannot be avoided of using gold currency in the meanwhile.

544. One last question. Your memorandum says that the project is a very formidable one and one that should be weighed very carefully. There are any number of factors which are highly speculative?—Certainly.

545. And being highly speculative, is it not advisable to take the most conservative view of the requirements rather than a less cautious view and, in the circumstances, would not the conclusion be drawn from the proposal that the amount of gold, in view of the fact that the factors are so speculative, would be far greater than you, with your great experience believe to be the case, and that that fact alone would be a factor in determining the purchasing power of gold for a long time?—Admittedly, the elements in the problem are largely speculative. In Mr. Denning's memorandum, I believe that in practically every case the figures represent the maximum in the sense that they are so cautious as to lead up to the final figure for the demand for gold which is the maximum which you can reasonably conceive as likely to result from this change. The very fact that the main part of the demand must come quickly in the first year or two, I think, is the answer to the other part of Sir Henry Strakosch's question, namely, that the uncertainty would, over a long period, lead to an appreciation of gold. I believe the uncertainty would be of comparatively short dimensions.

546. (*Sir Reginald Mant.*) So far we have arrived, I think, at this conclusion: that, in your view, the sterling exchange standard could be introduced at once without any appreciable difficulty?—Yes; it is practically in existence; all that is required for it, or almost all that is required for it, is a determination of the ratio at which the rupee is to be fixed to sterling.

547. But you would prefer to introduce the gold standard by stages? And that involves the selling off of a large amount of silver and buying gold?—Yes.

548. With the risk of upsetting both the silver and gold markets. The question I want to ask you is whether it would not be feasible to introduce or to perfect at once the sterling exchange standard and to let gold come into the country as it is doing and has been doing for some time, without attempting to force the process, without selling off rupees until the saturation point arrives by this natural

process, and to keep the gold standard in view as a goal to be achieved later? There have been large imports of gold lately and there is every indication of the process continuing?—Ever since the closing of the Indian mints to silver, with less or more emphasis, except, I think, in the case of the Chamberlain Commission, each Committee or Commission of inquiry that has sat on this subject has spoken about an eventual advance to a gold standard. It seems to me that the time has come when India may justly ask that a final decision may be taken on that matter. If, therefore, it is decided that the eventual goal is the gold standard, I would suggest that it is in the interests of India that the final transition moment should be reached as soon as circumstances will allow and the Rubicon crossed. I feel that any development of the exchange standard, unless it is accompanied by a definite decision to build up by all possible means a large gold reserve in physical gold—any attempt to develop the existing system—would merely mean that the same vast problem of converting hoards of silver into gold will stand as a wall against further advance at any moment that we can reasonably foresee.

549. But is not absorption of silver going on every year, and would not the problem become less difficult with lapse of time?—It may; but whereas on the one hand there has no doubt been a considerable tendency, visible last year at any rate, to convert silver hoards into gold hoards, I have no doubt that hoarding of silver rupees is also going on and will go on under the exchange standard and the liquefaction of those silver rupees will always be a problem ahead at the moment when the decision to introduce the gold standard has to be taken.

550. Would it not be more economical to let it come about gradually?—It might be. I am not sure it would come about gradually. But assuming that it would be so, it would be more economical in the sense that it might be less costly immediately to the Indian Budget. But I do not think it will be more truly economical in the interests of India as a whole; because I believe that the introduction of the gold standard is a necessary or at least a very desirable stage in the economic development of India as an investing country using western or highly scientific banking and monetary machinery.

551. Do you think that the fact that we move too slowly is a sufficient ground really for embarking now on this very hazardous course—a course to which there is likely to be so much opposition in both gold and silver markets?—I think the best argument for doing it is that it is in India's best interests to do it.

552. At once? That is what I want to know?—It must be as soon as possible. If the view is not held that it is in India's interests to reach this stage as soon as possible, then there is no argument for reaching it at all.

553. It might surely be said that there was an argument for reaching it when you can do it economically and without upsetting the rest of the world?—I do not think it can be done unless you can do it without completely upsetting the rest of the world. My argument is that if the first decision is taken that it is desirable, if possible, to give India a gold standard as soon as possible, then the second problem arises, is it possible to make such arrangements now or at an early date as will enable this to be done without upsetting the rest of the world?

554. (*Sir Henry Strakosch.*) And India, of course?—Certainly. India is as much interested as the rest of the world in seeing that her action does not simply destroy the value of the thing which she is trying to get for herself, because it would cease to be valuable to her if it caused such an instability or such a fall in prices as to amount to a complete reversal of the existing equilibrium, such as it is. I would, however, suggest that the moment just after the Great War, when things are not as stable all over the world as they might be, and when there is undoubtedly a large surplus of gold in certain parts of the world, is a moment when there may be opportunities for doing a thing of this sort, which may not recur when gold is more evenly distributed than it now is.

555. (*Chairman.*) You refer to the circumstance that in various Commissions and Committees the suggestion of gold circulation has been held out to India. Is it not relevant in connection with that point to remember the proposition, with which you agreed earlier in the day, that it had not always been clearly apprehended that a gold circulation was not a necessary accompaniment to a scientific gold standard?—I agree, though I think that some of the earlier Committees at any rate allowed themselves in writing their report to make assumptions about the necessity of a gold currency which were unnecessary.

556. (*Sir Purshotamdas Thakurdas.*) Is there any country amongst the Allied countries which took part during the war which has, as Sir Henry Strakosch has suggested, in accordance with Genoa resolutions, resorted to gold exchange standard instead of gold standard?—Of course, at the present time several of the Allied countries have completely fluctuating paper standards.

557. But England has returned to gold standard?—Yes.

558. What about France?—France has a paper franc whose recent value has deteriorated in proportion to the amount of the French Budget deficit which it has not been able to cover otherwise than by inflation.

559. What about Japan?—Japan is at present on no definite standard. Her exchange has depreciated, but she it no doubt attempting to work back to the gold standard of the kind that she had before the war.

560. She is not aiming at a gold exchange standard?—I am not sure to what extent gold circulates in Japan, but all these countries, I should say, are aiming rather at the international exchange standard than gold standard, in the sense of not desiring a large circulation of gold within their own country. England has succeeded in getting on to that, but that is a stage further ahead than it is possible for India to go at present.

561. I only wanted to know for my own information, because I do not know much about European currency systems, whether any country among those who were parties to the League of Nations has acted up to the resolution of the Genoa Conference.

562. (*Sir Henry Strakosch.*) Yes, all the modern currency systems set up or rather reconstituted since the war: Germany, Austria-Hungary are on the gold exchange standard; so is Holland. Holland has been on the gold exchange standard for a great number of years. Gold does not circulate in Holland, but notes and silver.

563. (*Sir Purshotamdas Thakurdas.*) But in Holland I should have thought that gold currency was very much in vogue?

564. (*Sir Henry Strakosch.*) No. Gold does not circulate in Holland, only notes and silver. (*Sir Basil Blackett.*) That is the difficulty. In India gold is wanted internally. In England it is enough to give gold for export. It may be broadly said that all the countries which have acted up to those resolutions have been getting into the position of having an inconvertible paper currency for internal use convertible into gold for export.

565. (*Sir Purshotamdas Thakurdas.*) In 1921 I think the paper was absolutely backed by gold?

566. (*Sir Henry Strakosch.*) Holland is on a gold standard. But gold does not circulate in the country. The Netherlands Bank will export gold, but there is no gold in circulation, nor is there any gold, as Sir Basil said, in circulation in the United States of America. They have certain gold certificates, but there is no actual gold in circulation.

567. (*Chairman.*) I believe there is a publication of the League of Nations which will give us full and accurate information upon these relative standards which it may be well worth while to obtain and circulate to the members of the Commission?—I have not really finished answering the question. I think

the answer is that every country that could do so is trying to educate its public up to the habit of being content with an inconvertible paper currency for internal circumstances, its absolute exchangability being maintained by the capacity to obtain gold for export. In some of these countries gold is actually in circulation to some extent. But in all of these absolute convertibility into gold is given, thought the gold is for export.

568. Just one final question on this aspect. You have told us in your memorandum, and I think again to-day, that you regard as a final ideal the system of an inconvertible note currency circulating and readily convertible into international currency for exchange purposes?—Yes.

569. In order to arrive at that ideal, the process is to educate the public by all possible means in the use of notes?—Yes.

570. Does it, in your opinion, recommend itself, as a means of such education, that you should provide them with another currency than a gold currency?—Possibly it may sound a little paradoxical; but I believe that is psychologically the only way it can be done owing to the existonce of the rupee, overvalued and with unlimited legal tender.

571. Then a last question on that; will it be easier to return from a gold standard by this process of evolution which you have just described to the ideal system of the inconvertible note currency than to arrive at it by a continunace of the evolution of the exchange standards?—That is the conclusion I have come to—I admit against my will—but very definitely, that it is not possible to reach the ideal system except through the temporary or otherwise extension into India of the use of gold currency. I believe it is necessary to make your ordinary means of circulation absolutely convertible into gold and to give ocular demonstration of the fact that it is so convertible before you can persuade the people especially of a continent such as India that an inconvertible note is entirely sufficient.

572. Is there any case of a population which has once been accustomed to even a partial gold circulation proceeding to an inconvertible note currency except under the influence of some great convulsion such as that of the great war?—I think the United States of America may nearly be said to be a case of that sort though, of course, there you had a civil war and green-backs and the long currency history. They did have civil war and green-backs and an incovertible paper currency, that had not a gold value; then it was given a gold valuo, and they have had the capacity to obtain gold and in practice did not use it except to some small extent, particularly in the Pacific Coast.

573. (*Sir Henry Strakosch.*) Would you say that we could have introduced an inconvertible note currency in Great Britain early in 1914, that is to say, take out of circulation the sovereigns current there and substitute for them inconvertible notes?—It is an hypothetical historic question, to which it is rather difficult to give a really useful answer.

574. (*Chairman.*) That is the ideal we contemplate as regards the future of India?—I do not think necessarily, because there is no suggestion of forcing the people of India to use gold coin habitually in circulation, but merely give them an opportunity of having it, as I believe they will habitually use the smaller coin rather than the gold one that I suggested should be given to them, namely, the twenty-rupee mohur.

575. With regard to the effective sterling exchange standard system, there is the actual benefit of an additional free balance of 18 crores?—Or, even ignoring that, some additional income from investments.

576. As regards the gold exchange standard, that allows whatever may be the additional cost of keeping a larger balance in gold in reserve?—Yes.

577. As regards the gold standard system the cost, according to Mr. Denning's original estimate, is 165 lakhs a year for the first 5 years, and about 112 lakhs a year thereafter?—Yes. May I suggest that you may take the figures in paragraph 20 of my note.

578. You suggest various proposals by which the cost could be reduced?—Either proposals for actual reduction of cost or inferences from the estimates that they are unnecessarily high.

579. In the first place, you reduce the estimate of 200 crores of silver rupees for substitution to 150 crores. In the second place, there is the proposal as to a silver import duty; and in the third place, a proposal for a reconsideration of the proportions proposed to be adopted for the new currency reservo?—The most important of those is in any case the actual amount, namely, whether the figure of 200 or some other figure is the right one, and that is the one that affects the proposal most. A definite proposal for minimising the cost is the 4 annas duty on silver. The proposal in regard to the modification of the proportions has some effect, but a comparatively small one, on the cost.

580. The substantial proposals are your re-estimate of 150 crores for substitution instead of 200 crores and a silver import duty. By these various means I understand that you arrive at the result mentioned in paragraph 26 of your memorandum?—Yes.

581. In fact, you reduce it, not to a vanishing point, but to an appreciable extent?—Yes.

582. I have one or two questions to ask on the silver duty on behalf of Professor Coyajee. Would not the proceeds of the duty on silver fall when Indians find that silver has entered on a course of very low prices?—I am not really relying on getting anything from the duty at all during the transitional period. The duty would act as a protection of the silver market, against any imports, in favour of the silver in the hands of Government; and if it is a 4 annas duty, such demand as there was for silver in India would be supplied entirely out of the Government of India's silver at some figure nearly 4 annas higher than that at which any silver could be imported from outside, so that probably there would be no import of silver during that period.

583. (*Sir Alexander Murray.*) In paragraph 13 of his note Mr. Denning says that when the gold standard is introduced, 74 crores of gold will be required for private imports, and that Government could force an increase in the private imports of gold of approximately 46 crores annually: will there not be another 20 crores necessary to replace silver which would not come in? That would bring up the imports of gold to about 140 crores per annum; if the silver does not come in, gold will come in?—No; my suggstion is that the imports of silver would cease, and in place of that the Indian demand for silver will be supplied by purchase from Government. For the time being there will be a reduction of the pressure of silver imports on the trade balance.

584. For the past three years an average of over 18 crores have come in?—That is about the figure.

585. What would take the place of this silver to adjust the balanco of trade?—It would enable the Government to make remittances of the proceeds of the silver sold here for the purpose of purchasing gold or buying credits outside India. In effect, it is the same thing.

586. (*Chairman.*) You are contemplating a reduction in the total imports of the country in proportion to the reduction of silver imports?—I am contemplating a very large increase, temporarily in the imports of gold, but stopping off of imports of silver would be one of the means by which the effect of the increased figure on the debit side in India's trade balance would be balanced.

587. It appears to me that you and Sir Alexander Murray are really at one, that the additional imports of gold which he referred to in this connection are really contained in the general increase in the imports of gold?—Yes. They have already been allowed for once.

588. (*Sir Alexander Murray.*) Mr. Denning does not do so in paragraph 13. He says, "Taking the sterling expenditure as £35 million or 46 crores and

neglecting remittance by Government in excess of the sterling expenditure, Government could force an increase in the private imports of gold of approximately 46 crores annually "?—But I do not think there is any need for the extra 20 crores that is coming in to take the place of silver. The suggestion is that the demand would be met without any further imports of silver for a long period from the Government's stock of silver.

589. How about your balance of trade then?—You are so much the better off. That gives India a better balance of trade to the extent of the cessation of the imports of silver. *Ex hypothesi*, the balance of trade including the extra imports of gold coming in would be turned against India to that extent. This absence of import of silver will be set off against that excess.

590. (*Chairman.*) I understand the assumption is that the importation of gold on private account continues as at present?—Yes.

590A. That really brings the two points of view together. The cost of the Gold Standard System is dependant upon the amount of gold required; and the amount of gold required is dependant upon those elements of certainty or uncertainty which we have analysed and which it is unnecessary to repeat; but we must recognise that if any of the adverse circumstances are realised they would probably increase the cost, such as the acceleration of the demand of gold for hoards?—I do not think they would proportionately increase the cost except in so far as they made the temporary borrowing involved come a little earlier. They do not increase the final result. The temporary borrowing is largely in the form of external borrowing, to meet the exceptional demand for external payments balanced by a corresponding diminution to a great extent of the amount of borrowing required in India. From the point of view of the budget, the two might be regarded as cancelling each other, but the point is that external credits are required rather than internal credits.

591. Let us take it from that point of view: supposing that one possibility were to be realised, that is a real upset of the world's gold prices, a fall in gold prices, and a rise in interest rates, that would increase the expense of temporary borrowings?—Why should there be a rise in the interest rates?

592. It will tighten up credit?—Yes, but a period of falling prices would tend after a short interval to lead to a fall in interest rates.

593. Might not the interval be coincident with the period during which you required to borrow?—Yes; that would not necessarily mean that the cost during the whole period of borrowing would be increased.

594. You do not see in the acceleration of the demand beyond that which is allowed for in the scheme any final increase in the cost of introducing the scheme?—I think the increase comes in only in so far as you have to hold a large stock of silver unrealised, and you are not able to use the proceeds of the sale of that silver for purchase of gold. You have to borrow a larger amount abroad, and the moment when you are able to amortise that borrowing out of the proceeds of silver is postponed, so that you have a longer interval during which temporary credits are required.

595. (*Sir Henry Strakosch.*) Those credits will be asked for at a time when you are going to withdraw very big amounts from the currency reserves of the gold standard countries?—They are for the purpose of enabling you to do so perhaps. I recognise that it is a somewhat bold request to put forward, first in the interests of India, and then ultimately of the world.

596. (*Chairman.*) From the general political point of view, might it not be said that if the Government of India has anything to give away in the way of financial benefits at the present time, that it has promised in the past to some extent to make use of these benefits for other purposes, such as reduction in the provincial contributions, removal of cotton excise duties, etc., and that if there is anything going they ought to come first and not a payment for the introduction of a new currency system?—I think I have said at one stage that I should not advocate the introduction of this unless the cost of it and the fact that that cost was to be met was as fully realised as it was possible to make it in India by all those concerned. I do not think it would be a breach of any undertaking on the part of the Government if it were to introduce a new currency system and find that thereby some of the directions in which it is desired to reduce taxation or give relief had to be postponed somewhat. It is a consideration that has to be met undoubtedly.

597. (*Sir Henry Strakosch.*) In order to visualise the effect of the introduction of the gold standard —and it is clear from Sir Basil's memorandum that he contemplates the establishment of a Central Bank, in these circumstances therefore to visualise the effect of introducing into India a big amount of gold, what would be the effect or what would have to be the policy of the new Central Bank in order to achieve that? Would not the policy have to be to keep a very tight hand on credit all the time, until saturation point had been reached, because there would be a need to attract gold from the gold centres, and that, of course, is done by raising the interest rate and keeping a tight hold on credit, because the flow of gold under that system would have to be automatic through the policy of the new Central Bank?—I think it is probable; I have not thought this out before. I think it is probable that just as we contemplate that it would involve exchange being kept normally at the gold import point for some little time, it would involve a policy on the part of those controlling credit and discount rates to avoid a period of too easy money. I do not know that it would necessarily involve periods of specially tight money, but it would probably involve action to prevent rates falling specially low.

(*The witness withdrew.*)

THIRD DAY.

Thursday, November 26th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Henry Strakosch, K.B.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.
Mr. A. V. V. Aiyar, C.I.E. } (*Secretaries.*)
Mr. G. H. Baxter }

The Hon. Sir Basil P. Blackett, K.C.B., recalled, and further examined.

598. (*Chairman.*) Towards the close of your most helpful evidence yesterday, Sir Basil, there is one aspect on which I should like to ask one or two questions, that is, the topic which we postponed at the beginning of your examination, viz., the Imperial Bank of India. On that there are four questions I should like to ask, all based upon the assumption that there is a transfer of the control of the note issue to the Imperial Bank of India, and also a transfer to the Imperial Bank of the management of the Government's remittance business. The first question relates to the constitution of the Bank, the second to the capacities of the Bank, the third to the financial aspects of the transfer, and the fourth to the account between the Government and the Imperial Bank of India in respect of services performed by the Bank for the Government and (on the other hand) the privileges of note issue. We might take them in that order. Do you consider that upon the transfer of the control of the note issue, assuming that is done, it would be desirable that there should be any changes in the constitution of the Imperial Bank of India?—This is a question into which I have not tried to go very far because I believe that this Commission would itself be better fitted for going into that question and making recommendations on it than any of us in the Government of India at the present moment. It is undoubtedly, I think, a question which will have to be considered —if it is decided that it is desirable to transfer the management of the currency to the Imperial Bank— whether the existing constitution of the Bank and its existing relations with the Government are adequate; but I have not any definite suggestion to make as to what form the changes in the constitution of the Bank should take.

599. There is, I believe, a widespread opinion that in its constitution a central bank of issue should be completely independent of any form of Government control: can you tell us what conditions there are peculiar to India which would have to be considered in connection with that question?—In relation to the total of banking business of India the function of acting as the custodian of the Government's funds and managing the paper currency and making Government remittances is a larger proportion of the whole than is probably usual in other countries at the present time; especially, I think, in the matter of remittances, where the Government is making remittances for capital or revenue expenditure outside India to the tune of 30 or 40 million sterling annually—a very much larger proportion of the total remittance business of India than anything corresponding in other countries. Even when, just after the war, the British Government was remitting four or five hundred million dollars a year to America, that was a very much smaller proportion of the total remittance business between London and America than the figures I have given for India; and, of course, in London that could be done without anybody knowing what the Government was doing, and it is much more difficult here. I think it is the proportion that the work done in India in connection with Government bears to the total work that is probably the most peculiar condition in regard to India.

600. You are calling attention to the circumstance that the interest of the Government of India in the business undertaken by the Bank on its behalf is so strong that India would rather differ from the normal case?—I was not drawing any conclusion from the fact, but merely saying that it is one of the points that would have to be considered in this connection.

601. It does point rather in the direction of indicating that there is at any rate an intimate connection between the financial officers of the Government and the Bank to a greater degree than in the normal case?—Of course while I agree that a central bank ought to be a private institution, and its capital subscribed almost entirely if possibly from private sources and in a position of entire independence politically, and representing the economic life of the country as a whole, at the same time it is most important that there should be a close co-operation between the Central Bank and the Government. There could not have been any closer co-operation that there was, or now is, between the Treasury and the Bank of England in the period since the war; and a very close co-operation of some sort is I think essential between a Central Bank and the Government. It need not necessarily be to any great extent controlled by the Government I think. Of course, as things are at present, we have the Controller of the Currency as a Member of the Central Board of the Imperial Bank.

602. But you point to the circumstance that experience elsewhere teaches one that it is possible to attain the necessary degree of co-operation without any formal or organized action by way of the establishment of partial control?—Yes. Historically, the Imperial Bank was formed by the amalgamation of the three Presidency Banks. There was this aspect of the establishment of the Imperial Bank that it was in the nature of a bargain, an arrangement between the three Presidency Banks and their shareholders on the one hand and those who were negotiating the unification on the other, the Government, so that the present constitution of the Imperial Bank represents something in the nature of a mutual agreement which might be looked upon as something of the nature of a sacrosanct charter by the shareholders in the original Presidency Banks.

603. Do you feel that there is any possible difficulty from the point of view of that condition in introducing large changes into the constitution of the Imperial Bank?—I doubt if those who were responsible for the constitution of the Imperial

Bank by the amalgamation of the three Presidency Banks expected that the exact form the Act would take at that time would remain unaltered for a very long time. I think they must have felt that it was a first step, to some extent experimental, and that alterations would naturally be made as time went on. In particular, of course, that is true is regard to the ten year contract between the Imperial Bank and the Government of India for the management of the Government balances. At the same time the shareholders have got to be treated with strict justice in any change that may be introduced; and the existing shareholders, who of course are the successors of the previous shareholders of the Presidency Banks, will have to be considered, and presumably will have to express their concurrence before important changes can be carried through, unless there were some suggestions for buying them out, which I hope will not arise.

604. By amalgamating the three Presidency Banks the shareholders in some degree surrendered a measure of independence?—They may have surrendered a certain amount of independence, but I do not think they have had any reason to complain that they have not done well out of the change. But it does necessarily mean, I think, that there must be a gradual transfer of emphasis, in regard to the work of the Imperial Bank, from the mainly commercial banking work that was done by the old Presidency Banks, to something more in the nature of work done by a banker's bank for the other banks in the country.

605. The second point is, as a condition of transfer, do you consider that it would be necessary to define more fully the capacity of the Bank as a trading concern, and if so in what direction?—The direction is easier to answer than the details. The direction is that of making the Imperial Bank a bankers' bank chiefly engaged in guiding the credit policy of the country and the financial policy, and run not mainly for private profit but more or less on a fixed dividend, with a reasonable return on capital, and not doing, at any rate in the Presidency towns, ordinary commercial banking in normal times, but more in the nature of rediscounting for other banks. Of course, upcountry it must have considerable freedom to do ordinary commercial banking. It has opened branches in new places, and I think it was Mr. Keynes in his annexe to the Report of the Royal (Chamberlain) Commission of 1913-14 who originally made the suggestion that the model should rather be that of the Bank of France than the Bank of England. We have now an Imperial Bank with a hundred or very nearly a hundred branches newly opened since 1920, in addition to the ones that existed before all over the country, which is of course quite a different model from the Bank of England.

606. In particular, would you look upon it as desirable, to attain those ends, that there should be a statutory obligation upon other banks to keep balances with the Central Bank, something in the nature of the Federal Reserve system, which requires a bank to keep balances with the Federal Reserve Bank,—and I believe it is also the case in South Africa?—It would be a matter for consideration. I am not sure that compulsion will be necessary in such a case, as soon as it becomes a central bank of issue. At present, I believe, all the important banks keep balances with the Imperial Bank.

607. (*Mr. Preston.*) We keep very large balances with the Imperial Bank?—Sometimes they are very small balances, even negative balances.

608. (*Chairman.*) What would be the effect of such a statutory provision upon the mushroom upcountry bank?—May I say, the upcountry bank is not necessarily mushroom.

609. Let me hasten to remove that implication by saying, an upcountry bank which is a mushroom bank?—I suppose it would give the Imperial Bank some power of controlling the opening of mushroom banks and to that extent and in that sense might perhaps assist the wise development of Indian banking. On the other hand the word "bank" as you know is very difficult to define. Banking business in India is done in all sorts of gradations—from a man who is little more than a village shop-keeper to the big Exchange Banks, or the Central Bank of India, and so on to the Imperial Bank. It is a little difficult to know at what point you would begin your obligation to make a bank keep balances with the Imperial Bank. You would hardly expect every village tradesman to do so.

610. The use of the word "bank" being such an important element in the situation, there might be some advantage in making the keeping of such a balance a condition of the use of the word "bank"?—Or you might perhaps distinguish between a registered and an unregistered bank? I think the use of the word "bank" has deceived many.

611. In nine cases out of ten it is the case, is it not, that when the public is deceived by an unsound institution it is deceived by the use of the word "bank"?—Yes.

612. Could you define a little further the limitations upon banking business in the financial centres to which you refer as being desirable in the case of a Central Bank for India?—Leaving out of question all exchange business, which is special, one would suggest that its business should be in that event confined as far as possible to such business as financing the trade and industry of the country by rediscounting general commercial bills of a currency of not more than say three months with two good signatures,—but that is rather a difficulty in a country like India, because in a country which is largely engaged in agriculture three months is somewhat short.

613. (*Sir Henry Strakosch.*) In South Africa a provision has been introduced enabling the Reserve Bank to discount bills with a currency up to six months subject to certain conditions?—I think it would make advances against bankers' drafts bullion, short-term Government securities and so on, again with a short-term condition if possible. I have endeavoured to note down some of the limitations, e.g., that it should not as a rule engage in trade or have any interest in commercial, industrial or other undertakings, etc.

614. It should not engage in trade, lend on debentures, make unsecured overdrafts?—It should be lending rather than engaging in trade. There is always the difficulty as to where the line of demarcation is. It should not advance money on mortgage of real property, or make unsecured advances, or draw or accept bills otherwise than on demand,—and then there is the rule that has been applied in a good many Central Banks, that it should not pay interest on balances on current account. The Bank of England I believe makes it a rule that it never gives interest on balances on current account, nor I think does the Bank of France, though of course arrangements are made by which it acts as agent for lending out money for its customers and it gets over that difficulty in that way.

615. (*Chairman.*) What would be the difficulty in India? Do you feel that there would be a difficulty in inhibiting a Bank from giving interest on current account in India?—Not on current account absolutely,—but on money deposited for a certain time it always has been the habit in India to give interest, and I doubt if it would be possible to develop the deposit habit in India unless that was fairly freely allowed; and as I say the Imperial Bank has got to do a certain amount of ordinary banking upcountry, and it is as a matter of fact I believe found that it does in a good many centres get money on short deposit, by offering a rate of interest, which otherwise would not be banked at all and that of course is obviously in the interest of India.

616. This is perhaps rather a question for the officers of the Imperial Bank but it may be that you can enlighten us upon it. Is it the case that, as a result of the amalgamation of the business of the old Presidency Banks, the Imperial Bank has still on its hands any volume of private business which should not be looked upon as properly the business of a central bank of issue?—Of course the Presidency Banks were subject to considerable limitations, and there is a good deal of banking business that the Imperial Bank is not now allowed to do, such for example as lending on mortgage; and there are a good many other limitations so that I fancy that the tendency must have been for the class of business which one wants to exclude at any rate from the head offices of the Central Bank to be excluded; but, of course, there are people here who would answer that question better than I can.

617. (*Chairman.*) Before I pass on to the next question, are there any supplementary questions on the constitution and capacities of the Imperial Bank?

618. (*Sir Norcot Warren.*) What is your opinion on the point that was raised that the Presidency Bank might do commercial business up country and no commercial business in the Presidency towns?—I recognise that that is a very difficult problem. It must be a question of originating business

619. I should think it is impossible. I do not know whether I am right, but I might ask Sir Henry Strakosch whether in South Africa the Central Bank was purely a central bank at first, and then they found they had no customers to lend to, and the Statute of the bank had to be altered to admit of their doing commercial business?

620. (*Sir Henry Strakosch.*) Yes, with limitations imposed upon the bank by its statutes, which were expanded so as to enable it to do some kind of commercial banking business; for instance, it is customary in South Africa also to allow interest on deposits, but that provision has remained in the Bank Statutes. Therefore its sphere of operations is very severely curtailed. Nevertheless it does do a little of the commercial business; but, of course, that is never capable of material expansion, because the bank cannot offer the facilities which an ordinary commercial bank could. But, of course, the bank has at times to enter into the general business of the country in times of stringency and stress.

621. (*Sir Norcot Warren.*) I say that the case is exactly the same as that of the Imperial Bank.

622. (*Chairman.*) At present.

623. (*Sir Norcot Warren.*) At present we are prohibited from doing all sorts of business by the Act. You have only got to read the Act to see the way we are limited.

624. (*Sir Henry Strakosch.*) Of course, your Act is far wider, and gives you much more scope than the South African Reserve Bank Act, and it is for that reason, I submit, that the statutes are not really the statutes of a real central bank.

625. (*Sir Norcot Warren.*) I quite agree with you; but at the same time, just as in the case of the Bank in South Africa, who are we to lend to? What banks are we to lend to, or re-discount their bills? There are only about three banks in India we might lend to. The Exchange banks I suppose would not want to borrow; there is only the Central Bank of India, the Bank of India, and perhaps the Punjab National Bank.

626. (*Chairman.*) Let us see if we can frame these points into a question, because Sir Basil is the best witness we could put the point to. I think it is really contained in your original question, Sir Norcot Warren, as to the difficulty of distinguishing between the business of a branch and the business of the head office, and to that Sir Basil has really given us his answer that he does see substantial difficulty?—May I say that in the answers I have been giving I was quite consciously rather suggesting the model statutes for a non-existent central bank than suggesting the exact form of the business that should be done by the Imperial Bank of India, and I recognise that a very great deal of adaptation to circumstances would be essential in India. Whether you could get even approximation to some of the central banks recently set up, in Central Europe, for example, is a very moot question. For instance, when we were dealing with a new central bank for Austria it was a very different problem from the one we are dealing with in India.

627. This scheme being obviously so largely experimental, that is, as to the effect of a true central bank upon Indian commerce and industry, that suggests the desirability, if possible, of establishing some machinery for the revision, without undue waste of time and elaboration of legislation, of the provisions as to this matter. Is that a matter which perhaps should be taken into consideration in framing the definition of the capacities of the central bank?—You would suggest something in the nature of rule-making powers in the Government to alter the rules without coming before the legislature?

628. Are there precedents for such a maxim in Indian legislation?—I was wondering whether the bank would like that power to exist—*viz.*, that the rules could be altered except otherwise than on its request or something of that sort. I have not thought out anything on these lines. I think it is possible to exaggerate the difficulties of getting an Act through the legislature.

629. (*Sir Henry Strakosch.*) If I may say so, I think it would be rather dangerous to allow changes in the statutes of the Bank to take place without the authority of the legislature; but I should imagine that it should be possible to frame statutes to meet the requirements of India. Obviously in a country where banking is so in its infancy one might have to introduce rules and statutes which differ from the rules of a central bank in a country with a highly developed banking system, and nevertheless retain the salient features of a central bank, to perform its functions properly. I should say it is not impossible to frame statutes on those lines?—I feel confident that it is not impossible if desired.

630. Of course, while the number of banks with whom the Imperial Bank would have business relations at the moment is small, I believe the fact that the central bank exists, and is able in times of stress to offer facilities for rediscounting and, moreover, that any of its business connections could only be established when the Imperial Bank has satisfied itself that the bank is run on sound lines would eventually lead to purifying the commercial banking system of the country; it will have to act at first principally as an educational authority, to build up a sound commercial banking system.

631. (*Sir Norcot Warren.*) And while the education is going on, what is to happen to our dividends?

632. (*Sir Henry Strakosch.*) The dividend is all right, I think; you have got the right of note issue, and you will have the benefit of the deposit of a substantial amount free of interest; I am not worried about the dividends; in fact, I think the dividends may possibly be too high, unless you make provision to limit them, as is the rule with many central Banks.

633. (*Sir Basil Blackett.*) Is it suggested that the dividend should be paid at the expense of the Government out of the Government's share of the profits on the note issue?

634. (*Sir Henry Strakosch.*) My ideas are—and they have been adopted in very many statutes—that a certain maximum dividend should be allocated to shareholders, and the surplus should be devoted first to building up good reserves, and the balance to go to Government.

635. (*Chairman.*) We will take that as a separate heading—that is, the terms as between the bank and the Government; it appears to me that Sir Basil has really taken us as far as he could in what he has told

us as to the possibilities regarding the financial capacities of the bank?—Rather further.

636. (*Sir Reginald Mant.*) Sir Basil, I understood you to say that theoretically the central bank ought to be independent of Government. Do you think that in the circumstances of India it will be possible to find competent management and direction for a central bank in charge of the currency, if it is cut off from the assistance and advice of Government officers?—Is it really cut off from the assistance and advice of Government officers by being made independent? Admittedly the problem of getting first-class management is a difficult one anywhere, and probably especially difficult in the transition stage in India. But I think there is always a tendency in life, when a difficult task has to be done, for the man to turn up, attracted sometimes by the very difficulty of the task.

637. You have not the resources or anything like what you have in London, for instance?—Certainly not at present; but London is not the only comparison.

638. But you think that the difficulty is not insuperable?—One would hope not; obviously one cannot say really more than that.

639. You have said that it is desirable to get the currency business out of the political arena—that the transfer to the bank was desirable for that reason. Do you think that the management of the bank could be kept out of the political arena?—I do not think I put it like that—that it would get it out of the political arena; what I said was that it would get it into a commercial and business atmosphere. The Bank of England has, on the whole, succeeded in keeping out of the political arena in England in spite of considerable temptations at times for it to come in and for it to be drawn in.

640. Have not political issues been raised in connection with the bank—such as Indianisation, for instance?—They are bound to be—in connection with anything in India.

641-2. They are raised in connection with every industrial company—that same issue of Indianisation. You cannot get away from politics by transfer to the bank?—No. But I think you get it into a different atmosphere.

643. (*Chairman.*) Now on the third question to which I referred, still assuming transfer of control of the note issue, I want to refer to the question of any necessary readjustments in the capital account of the bank, and in order to make my question clear, I put it in this way: as I understand, by the transfer it is proposed that the bank should take over the assets and the liabilities of the currency reserve; but now as to the gold standard reserve, what would you propose as to the adjustments in the capital account of the bank as regards the gold standard reserve?—If it took over the assets and liabilities just as they stand, an equal amount of both, it is not absolutely essential that there should be readjustment of capital.

644. What would be the liabilities as against the assets taken over from the Gold Standard Reserve?—The outstanding notes.

645. Are not those covered by the assets of the currency reserve?—That is what I mean; I was referring to the position under a gold standard they would take over the liabilities for the outstanding notes, and on the other side they would take over the assets, which in my suggestion include a considerable amount of Government of India Debt, some of it newly created, in the form of book debt to cover the nominal loss from the sale of silver. It would not necessarily involve readjustment of capital; it might be desirable, but it is not absolutely essential.

646. But here is the gold standard reserve of £40 millions without any defined liabilities of any sort against that asset. That will now appear in the balance-sheet of the Imperial Bank, and what is set against it in the balance-sheet?—The gold standard reserve would under the gold standard proposal have been completely used up in buying gold; it would have disappeared.

647. Under the gold standard proposal?—Yes, because the whole of it would have been required, or very nearly the whole of it, to pay for the gold that is needed for importation into India.

648. But that gold would either be held by the Imperial Bank or it would have been paid out in return for some other asset, would it not?—It would have been paid out for silver rupees, which would have been melted down and involved a loss.

649. There being only a balance remaining, the bullion value of the rupees melted down?—Exactly.

650. So that we reduce the free asset as it were to the bullion value of the rupees purchased with the gold?—Yes.

651. And what would appear against them on the other side of the sheet?—The Government of India book debt against the loss.

652. Against the continuing asset?—There is no continuing asset, I think. The best way I can answer that question is this: in paragraph 25 of my memorandum I have suggested a constitution for the new reserve. If you will take the second of the two tables there, I have suggested that against their liability for redemption of the notes and for the maintenance, of course, of parity of exchange the bank should hold a minimum of assets in the reserve of 45 crores of gold, 90 crores of Government of India Book Debt, and 54½ crores of sterling and other gold securities. Would not the bank have paid sufficiently for being given those assets by taking over the full liability to redeem the notes *plus* the liability to pay something in respect of the profits? My point is, it need not necessarily involve an alteration in the capital account.

653. It appears to me at first sight as if the liability of the bank to redeem the notes was set against the assets taken over from the currency reserve, and although a further liability has been taken over which it may be said is to be set against the assets of the gold standard reserve, the question is how that liability is to be defined?—I think the only liability that is left at the stage I am contemplating is the liability to redeem the notes. On this hypothesis there is 189½ crores of notes in existence, representing the promise of the Government of India to pay on demand. The bank takes over this promise and substitutes its own notes for them in due course—not, of course, immediately, but over a certain period of time; and as its own notes are substituted for these Government notes it takes over the assets that the Government has. There will not be any surplus assets under the gold standard proposal, because the gold standard reserve will, I think, have been fully dissipated in meeting the loss on sale of silver rupees.

654. (*Sir Henry Strakosch.*) Sir Basil, what you have just told us refers to the introduction of the full gold standard with gold in circulation. But is not the position somewhat different if the gold exchange standard or sterling exchange standard were to be introduced? In that case, as I understand the position, there would be the liabilities of the note-issue and assets to cover that fully, but in addition to that there would be 50 crores of reserves which have been set aside to meet the requirements for external stability of the rupee coin circulation; that is, an asset which would have to be taken over by the Imperial Bank, against which there is that liability?—A liability against which there is no asset.

655. No; there will be assets against which in the books of the bank there will not be any liability; the assets would be 50 crores, which, according to your scheme, would be set aside as a reserve for stabilising the exchange. A liability has to be created to meet that asset, and would you consider it an appropriate method if the Imperial Bank were to partially find that liability in increasing its capital and partially

as a deposit by the Government in terms of the charter?—I agree that the particular form of currency system chosen requires dealing with separately. What I was dealing with was the gold standard. I think that was the question that the Chairman was asking me. The arrangements with the bank will have to be different either under the gold exchange or the sterling exchange standard. In my memorandum I have suggested that there will be an additional liability of 50 crores created to represent the liability to maintain the exchange value of the rupee, and that against that gross liability for notes *plus* the 50 crores the Government should hand over to the Imperial Bank assets of the paper currency reserve and gold standard reserve up to that total. Under the sterling exchange standard I have suggested that that leaves a surplus of 18 crores on my figures which the Government would not hand over, but which they would retain for themselves as surplus. The suggestion of Sir Henry Strakosch is that the rupee liability of 50 crores should be expressed either in the form of an addition to the bank's capital, paid for, I suppose, by the Government by handing over these reserves and representing Government holding therefrom in the bank's capital. . . .

656. My suggestion was that I think 50 crores increase of capital would be unduly high; that a part of that 50 crores should be used to increase the capital, and a part of it should appear in the bank's balance-sheet on the liability side as a deposit by the Government for the term of the charter?—That is to say, the capital of the bank will be increased by any round figure, say 10 crores, and the Government would subscribe for that 10 crores by handing over 10 crores of assets of the currency reserves—really the gold standard reserve. In addition the Government would make a deposit of (on that figure) 40 crores, paid for by handing over 40 crores more from the gold standard reserve; and is that to be an interest-bearing deposit?

657. No; free of interest?—The Government getting its return, on whatever arrangements were made, out of the profits on note issue? That would be quite a feasible plan, as far as I understand it, if the shareholders of the bank could be brought to see its benefits.

658. If they get a free deposit of 40 crores they ought to be jolly glad?

659. (*Sir Norcot Warren.*) And no party to lend to.

660. (*Prof. Coyajee.*) Would not the liability be the statutory obligation to redeem rupees as they are offered for conversion into foreign exchange, and therefore you might save a certain proportion of the difference between the nominal value of the rupee and the bullion value?—That is ultimately what I have suggested; only I have taken the arbitrary figure of 50 crores as measuring it.

661. (*Sir Henry Strakosch.*) May I suggest that that does not seem to me to be correct. The bank undertakes, under its charter, to maintain the value of the rupee coin or notes, and for that purpose it needs an exchange reserve. It receives an asset from the Government of 50 crores and its liability is to maintain the exchange value; but you cannot express that in a balance-sheet; you must set against it some concrete figure; hence my suggestion. Sir Basil, the present capital of the Imperial Bank is 11¼ crores subscribed, of which 5⅝ crores are paid up. Would you not consider it desirable, when the Imperial Bank is remodelled and established as a pure central bank, that the uncalled capital should be cancelled and the paid-up capital increased, my reasoning being that a liability on bank shares, especially of a central bank, is not worth much, because, if the Imperial Bank has to call upon its shareholders to pay up the rest of the capital, one may suppose that the conditions are such that none of the shareholders will be able to pay it?—I am quite prepared to agree as a general principle that an uncalled liability on bank shares, particularly central bank shares, is not a very valuable asset in time of trouble for the creditors.

662. And that therefore it would be advisable to cancel the uncalled capital and rather increase the other. And then another question. Would you consider a capital of 10 crores paid-up sufficient? At the present moment, as I said, the paid-up capital is 5⅝th crores. I may perhaps say that the principle which has guided many people who have framed the central banks was that the capital of a central bank should be moderate, as, in fact, the Bank hardly ever needs its capital except as a reserve, and that a big capital would be rather an inducement to a central bank to launch out into business which it would not otherwise do, and for that reason it is well to keep the capital of the bank within reasonable limits. Would you, in these circumstances, regard 10 crores as an appropriate capital?—I don't think I have any very definite view until one sees the exact scheme. It is rather hard to express any definite view. I would agree, I think, that the figure of the capital, as it is at present constituted, would look a little bit low in relation to the gross liabilities if the Imperial Bank took over the note issue.

663. (*Chairman.*) Then we come to the last of my four headings on this part of the subject and that is the account as between the Imperial Bank of issue and the Government. The Imperial Bank of issue would perform the following services for the Government. It would be doing the remittance business for them, and it would be controlling and managing the note issue for them. Are there any other services to be taken into consideration?—Of course, the bank will continue presumably to be the depository of Government balances?

664. That is on the other side. I was thinking of that as an advantage to the bank. The bank manages the rupee debt for the Government?—Yes. It does not do all the functions that the Bank of England does. There is a separate public debt office, but that is merely a question of machinery.

665. What business is transacted at the public debt office?—The business of transfer and all the business of registering transfers and so on which in England is done in the Bank of England—rather peculiarly in the Bank of England. I think it is rather peculiar to the English system that the Bank of England is the actual registrar of the debt.

666. And the business transacted in connection with the rupee debt in the Imperial Bank is the business of issue?—The business of issue and the payment of dividends; and of course in England they have recently taken over the actual management of the rupee debt from the Bank of England.

667. Is a register kept in England?—Yes.

668. Then, on the other side, the Imperial Bank of India has the use of Government balances?—Yes.

669. And it is proposed that they should have the privilege of note issue?—Yes.

670. In Mr. Denning's memorandum there are three methods suggested by which the Imperial Bank of India might make the balance payment in respect of these particular services?—Or rather, of the one particular service of managing the note issue.

671. I understand that it is proposed that it should be the only payment made by the Imperial Bank of India to the Government, or on the other hand that there should be no further payment by the Government to the Imperial Bank of India?—Yes, but I think Mr. Denning was intending really to deal with this question by itself, without raising questions of the payment made or not made in respect of other functions of the Bank. He wished to deal with what payments the Bank should make in respect of monopoly of note issue.

672. Are you contemplating that this should be in fact the only payment made as between the two parties?—At present the arrangement is that there are no payments made either way except the pay-

ment that is made in respect of the issue and payment of dividends,—what is called the management of the debt.

673. Is something in the nature of a fee charged in respect of the service and management of debt?—Any payments of that sort were left out of account in this memorandum. Mr. Denning dealt solely with what was a reasonable arrangement between the Bank and the Government in respect of these particular functions. They might of course be combined with other functions. In that case we should have to look into the other services.

674. I don't quite follow your last point?—You might take the whole of the relation of the Bank and the Government as a whole, and consider in respect of what service, if any, the Bank should make a payment or you might even have an arrangement by which the Government got its payment in the form of a share of profits. Or you might isolate each particular service that is rendered and consider whether in respect of it there should be or should not be a payment and deal with it by itself.

675. Which procedure would you recommend? Would you recommend that the mutual account for services should be balanced by a single payment in respect of the privilege of note issue?—I am inclined to think that at any rate the easiest way to approach it is to leave other things as they are and consider what payment the bank should make in respect of note issue.

676. So that the only other circumstance which we would have to keep at the back of our minds is that a payment is made in respect of the control of the debt?—And that the Bank gets the use of the Government balances without charge; and would get, not improbably, some slight additional control of the balances if the system suggested regarding remittances to England were adopted. Because in that case the balance might tend to be slightly higher in India and slightly lower in London.

677. That is the circumstance to which we referred yesterday. Then, in Mr. Denning's memorandum with regard to the payment of the Imperial Bank, three alternative courses are suggested, (1) that the Government might take a share in the profits of the Bank, (2) a separate profit and loss account might be kept for the note-issue department of the Bank, and Government might take annually all, or nearly all, of the profit shown therein, (3) the Bank might pay Government a percentage on the amount of the invested portion of its Currency Reserve over and above a fixed figure which would be free. Of these three alternatives, do you feel able to express a preference in favour of any one?—A preference is expressed in Mr. Denning's memorandum on the whole in favour of (3). I do not feel that I myself have so far got to the bottom of this question sufficiently to express a decided preference for any. It would depend on the whole arrangement arrived at. For instance, there are undoubted attractions in the suggestion that has just been made by Sir Henry Strakosch in regard to the Government getting newly created shares in the Bank; in which case you would introduce there a new set of circumstances and the whole would be reconsidered in that connection. But method (3) is undoubtedly the simplest. I don't know whether the Commission have seen a note circulated a day or two ago by Mr. Denning on the profits obtained by the Government from the existing note issue. That brings out some of the difficulties of the second alternative. If you look at the Appendix you will see that the profit varies enormously. And if a separate profit and loss account was to be kept, it would seem to involve some rather difficult calculations, and also to involve some control, for example, by the Government over the salaries paid to the people who are working in the Currency Department, which I think would be very undesirable.

678. (*Sir Henry Strakosch.*) Particularly so, if the fiduciary part of the note issue were covered by commercial bills?—Particularly.

679. Have you any other suggestions to make on method (1)?—I think at the back of my mind I have a preference for something in the nature of method (1). But I have not worked it out.

680. Those reasons in favour of method (1) which are at the back of your mind are not yet sufficiently formulated?—It would depend so much on the development of the proposal. On the lines, for example, just suggested by Sir Henry Strakosch of the Government becoming a shareholder.

681. May I just say this, that, of course, quite apart from the Government being a shareholder and therefore drawing its dividends from that share holding, the main revenue would of course come by way of surplus profit?—Yes.

682. (*Chairman.*) Then I think we must leave your evidence on that point in this state, Sir Basil, that method (3) commends itself on account of its simplicity; method (2) presents difficulties because of the considerations involved in striking a balance of profit and loss and the question of some form of Government control. Method (1) may have factors to recommend it but on the whole it is impossible rightly to decide which is the most appropriate method except after a decision as to the actual arrangements involved in substance between the Bank and the Government?—Yes, that expresses my opinion. I must apologise to the Commission for not being able to give them any other guidance in this matter.

683. If I may say so, Sir Basil, it needs no apology because the doubt is due to the circumstance that one cannot arrive at an exact decision until one knows precisely what the arrangements between the Bank and the Government are to be in substance?—Quite so, and that is what I have in mind. A good deal depends on what is the arrangement made in regard to the powers of the Bank, *e.g.*, as to the taking over by the Bank of the remittance business of the Government. That may involve, for example, the extension of the Bank's powers to deal with exchange, a point which perhaps I might have mentioned when you were asking what changes in the constitution would be required. And it may involve some addition to the Bank's capacity to earn profits at the expense of Government, which to some extent go to Government at present; I mean in connection with remittances. And that would have to be taken into account, I think, as well as the direct profits on note issue.

684. (*Sir Henry Strakosch.*) But which would come back if the Government share the profits of the Bank?—That is one of the reasons why I have at the back of my mind that a share of the profits might be a useful method.

685. (*Prof. Coyajee.*) How does the Government share the profits of the Bank, in France? Can you throw any light on that point?—I am afraid I have not got it actually in my mind. There are so many different methods in the various countries. It is rather difficult to carry in one's head all the different arrangements. There are different arrangements for different countries. They are not very difficult to obtain.

686. (*Chairman.*) We will have this ascertained, Mr. Coyajee. I am sure, Sir Basil, the Commission would like to express their very warm thanks for your evidence and the most helpful manner in which you have given it. I hope that we have not occupied too much of your time?—That certainly is not the case. Thank you.

(*The witness withdrew.*)

The Hon'ble Mr. A. C. McWatters, C.I.E., I.C.S., called and examined

687. (*Chairman.*) Mr. McWatters, you are the Secretary in the Finance Department?—Yes, Secretary to the Finance Department of the Government of India since March, 1923.

688. And for the sake of our record, will you tell us what your previous experience was?—I have been 21 years in the Government service in India, of which the last 16 have been spent almost continuously in the Commerce and Finance Departments of Government in various appointments, including Wheat Commissioner during the War, and Controller of Hides and Wool; in December, 1920, I became Controller of the Currency, becoming Finance Secretary in March 1923.

689. You were Controller of Currency for two and a half years?—Yes.

690. I understand that you are giving us evidence not as representative of the Government of India, but in your personal capacity?—Yes.

691. We have had the benefit of receiving from you two memoranda—an historical memorandum upon the recent history of the Indian Currency and a memorandum on the stabilisation of the exchange?—Yes.

692. And in addition to that you have taken part in the discussions, as appears from the memorandum, between Sir Basil Blackett and Mr. Denning, the Controller of the Currency, upon which both these memoranda and others with which we have been supplied are based. But, I repeat, in all these memoranda you are expressing your personal views?—Yes.

693. Now, let me turn in the first place to your historical memorandum. Passing to the events of the war period during which the Indian currency system had new and strange experiences, could you tell us in general what the effect of the abnormal events of that period have been upon the currency system in India?—When I arrived in India in December, 1920, I think it was fairly easy to obtain a general view as to what had happened in the immediately preceding period and why the attempt which was made in 1920 had broken down. I think, in very brief, it was that neither the reserves of the Government of India nor the position of the business community permitted such reduction in the currency as would have been sufficient to maintain the exchange at the rate which had been recommended by the Babington-Smith Committee. When I arrived in the country the rate was already 1*s.* 6½*d.*, the attempt to maintain the two shilling rate having been abandoned late in the autumn. By February it had reached 1*s.* 4*d.* By that time the swing of the pendulum, owing to the great fall in prices elsewhere and owing to the entire change in the balance of trade, had practically made it impossible for the Government of India to do very much directly to support exchange. In two ways they tried to help the situation. The first was by avoiding so far as possible any action which would prevent exchange rising. They were able, for instance, to utilise the large sterling receipts which they had, mainly owing to payments received from the War Office, in meeting their sterling expenses. They were able to borrow to a considerable extent in England and they kept out of the Council Bill market altogether for a period of years. At the same time they did actually make certain small reductions in currency. The greater part of the reductions were made before March 1921. The last was in August 1923. The second thing was that they endeavoured to put their financial house in order by balancing the budget; and also by borrowing both in India and at home so as to clear out of the way the extremely large and dangerous volume of floating debt in the form of Treasury Bills which at one time exceeded 50 crores. They succeeded in doing that, and it was not until that was accomplished that any action which they were able to take in reducing currency could have had much effect. I think reductions were practically nugatory so long as we had continued deficits. The deficits in 1921-2 exceeded 20 crores; this was reduced to 15 crores in the following year; and then, largely as a result of retrenchment, and also thanks to good seasons, they were able to get a surplus of two crores in the following year. And last year also there was a satisfactory surplus. I think that putting their financial house in order probably helped more than any action which they took in restricting currency, towards strengthening exchange. When exchange reached 1*s.* 6*d.* sterling in October, 1924 the position then arose that Government had before them, as Sir Alexander Murray knows, a strong representation from the Bengal Chamber of Commerce which pointed out that the commercial community were much exercised as to the possible results of the next busy season. They saw no chance of avoiding extreme fluctuations in exchange unless some definite action was taken by Government, and the Government at that time came to the view that any substantial rise in exchange above 1*s.* 6*d.*,—with possibly fluctuations up and down—might be extremely harmful.

694. Let us stop at that point and take the principal events in connection with the currency since the abandonment of the effort to maintain the 2*s.* standard. Let me take you a little further back and ask you this. I understand that the principal feature of the war period was the enormous demand for currency. Is it a conspicuous historical feature that the result of that has been to leave India with more elastic currency system than it had before the war?—I think that there was one very marked change in the course of the war period, and that is the great increase in the paper currency and the much greater readiness on the part of people in India to take paper currency. The increase is very marked throughout the war period and it has received no setback since. To that extent the currency is more elastic.

695. There has been an increased willingness to make use of notes?—Yes.

696. Also there has been a great expansion in the fiduciary issue?—Yes.

697. The last expansion was I think in February 1925 when the maximum was raised to 100 crores?—Yes.

698. The whole of that maximum is not now worked up to?—The increase from 85 to 100 crores was a permissive increase taken in view of the possibility of Government having to increase the currency in the event of extreme stringency in the busy season. Actually the fiduciary issue has not reached the figure permissible before, and a margin of more than 15 crores still remains.

699. Have we not in that fact an element of elasticity which there was not before the War?—Yes.

700. In the second place there was the new feature of the power to issue emergency currency against bills of Exchange?—That was originally 5 crores. It was raised to 12.

701. The date on which that came into force was October, 1924?—Yes, and the conditions under which it can be used have been modified; they are more liberal than when first introduced. At first nothing could be taken under 8 per cent.; but now the first 4 crores can be taken at 6 per cent. and the remainder at 7 per cent. or above.

702. Resuming now your historical account at the point at which I interrupted it, we got to the point at which the rupee had arrived at 1*s.* 6*d.* and you tell us in para. 18 of your historical memorandum that the action taken by the Government of India since October 1924, the date in question, has been directed towards preventing the rise of the rupee above 1*s.* 6*d.* Will you tell us why the action of Government was necessary at that point?—I think the real answer is that it was the beginning of the busy season. I do not think the fact that it coincided with 1*s.* 4*d.* gold was the deciding factor. I think, as I have already

said, it was due to the strong representations of the commercial community and the anxiety of Government in regard to the coming busy season; and as exchange was very strong that meant steadying the exchange at the upper rate.

703. Then shall we put it in this way, that it was considered that action must be taken at some time and the commencement of the busy season was the right moment at which the action should be taken?—It was the only moment to prevent, what we considered, might lead to serious trouble. If we had postponed action, as was proved by the actual purchases in October, it would have resulted in the exchange rising well above 1*s*. 6*d*.

704. That perhaps does not quite answer why the 1*s*. 6*d*. rate was chosen as the rate above which it was undesirable to allow the rupee to rise?—It was the rate which exchange had reached before the busy season commenced.

705. (*Sir Purshotamdas Thakurdas.*) I should like to ask one question about paragraph 4 of Mr. McWatters' historical memorandum. There Mr. McWatters says "A new system usually described as the gold exchange standard was then established". I wonder if Mr. McWatters will agree with me that the gold exchange standard was evolved by a policy of drifting away from the recommendations of the Fowler Committee. They recommended a gold standard. The gold exchange standard was not part of their recommendations; it was evolved by the Executive here?—I admit it was evolved. It was not in its final form what the Fowler Committee recommended. In fact Government adopted practically Mr. Lindsay's recommendations, which the Fowler Committee pronounced against.

706. (*Chairman.*) A feature of recent currency history has been, has it not, the introduction of a new mechanism for remittances?—Yes.

707. That is by the purchase of sterling in India instead of by the sale of council drafts in London?—Yes.

708. Might one say that this is the adoption of a more ordinary and commercial method instead of a more extraordinary and official method?—I am not sure that I should go quite so far as that. It is still an official method in so far as Government operates it direct. I should not regard it as a commercial method until the whole mechanism is taken over by the Imperial Bank. It was originally intended to take the place of the sale of "intermediates," so as to regulate the market in between council sales rather more effectively; and, more particularly, when exchange became more definitely fixed, it was found convenient to adopt this method more and more under the particular circumstances of the last year.

709. Has it been found to work equally satisfactorily?—I think so. There have been complaints. The principal complaint of the commercial community is the absence of sufficiently early information as to Government's operations. That matter will probably be brought before the Commission by the Bombay Chamber of Commerce, which has been taking interest in it. Apart from that, I do not think any serious complaints have reached Government.

710. Of course, the new method of the purchase of sterling is a method which is suitable if business were conducted by a bank; the method by the sale of council drafts is less suitable if the business were conducted by a bank?—Yes.

711. One final question on the historical aspects of the currency. What has been the effect, if any, in your opinion, of keeping the nominal 2-shilling gold rate on the statute book?—I think the answer is, none. The only instance in which I can recall any difficulty having arisen was in connection with Australia. At one time the Australian Government applied their dumping legislation against certain Indian products, and the ground alleged by them was that India had a "depreciated exchange" because exchange was much lower than the 2-shilling rate; but when the true history was pointed out they at once withdrew their order. Apart from that, the actual rate remaining on the statute book, although obviously undesirable, has not caused any material injury.

712. Would it have been the case, do you think, that more gold would have gone into actual circulation as currency if it had not been for this provision?—I do not see that. Some statutory rate has to remain on the statute book, and unless one is in the position to introduce a new rate, I do not think gold could go into currency.

713. Your answer is that if gold has been kept out of the currency it has been by the fluctuations of the exchange rate?—It has been by the absence of any effective rate.

714. And not so much by the mere existence of the 2-shilling gold rate?—It has been by the existence of a rate which was completly inoperative, a rate which offered 10 rupees for the sovereign when the value of the sovereign was very much higher. Unless the rate bears some relation to the reality there would be no possibility of sovereigns coming in.

715. (*Sir Purshotamdas Thakurdas.*) You said just now that the 2-shilling rate was ineffective. Had it any other adverse effect except the one regarding Australia? Large quantities of gold have been imported into India during the last two years. If you had, say, 1s. 6d. on the statute book, people could tender gold at Rs. 13 and odd instead of Rs. 10. To that extent it has prevented gold being tendered to the Currency Office if people who held gold wanted to realise it?—That, certainly, was the position up to a certain point.

716. Do you know that last season in Bombay 7 per cent. was paid by importers of gold? The banks charged bank rate against gold. And is not 7 per cent. a high rate at which to pay interest on gold?—Yes, certainly.

717. If, therefore, an operative rate was on the statute book, it is possible that gold would have come into the Currency Office?—I entirely agree that the sooner the 2-shilling rate can be removed the better.

718. (*Sir Reginald Mant.*) You said there had been complaints regarding the purchase of sterling on the score of absence of publicity. Can you tell us what degree of publicity there was?—The purchases are published monthly after they have taken place. The Bombay Chamber of Commerce pressed, I think, for immediate information of daily purchases made by Government, and in the alterantive they would perhaps have agreed to weekly returns of purchases made. Their complaint was that they had to pick up what knowledge they could get by going round to various brokers.

719. How were the purchases made?—Through the Imperial Bank. The Imperial Bank are given a buying limit and they make purchases through the Exchange Banks. They are given a limit, both of rate and of quantity.

720. They are given the minimum rate?—An actual rate which is fixed under instructions from the Controller of Currency.

721. It might be altered during the course of the day?—Frequently, yes.

722. Did you consider the possibility of introducing a tender system for these purchases of sterling?—I do not at the moment remember whether that was considered. I doubt whether in present conditions it is preferable to the system now in vogue.

723. You do not think it would have been preferable when you were purchasing large quantities of sterling at varying rates to invite tenders to obtain the best rates?—I think it would have been more complicated and could not be applied from hour to hour in the same way as the present system.

724. There are a number of markets?—Yes, the operations take place not only at Bombay and Calcutta, but at Karachi and Madras.

725. So you could not really work that system in this country?—I think it would be more difficult.

726. In fact, probably London would be the only market in which you could work it?—That may be so.

727. (*Sir Purshotamdas Thakurdas.*) You said that the deficit in 1921-22 was about 15 crores?—Over 20 crores.

728. Did this include any loss in exchange?—No; that is the revenue deficit.

729. Without the reverse councils?—Yes, that is quite separate. That is actual revenue deficit.

730. The loss in exchange is separate?—Such losses as have occurred in various ways through reverse councils or otherwise are quite separate.

731. They were not included?—No, they were not included.

732. (*Chairman.*) Now I proceed to your memorandum on stabilisation. The initial words of your memorandum are: "It may be accepted without question that there is a general desire, both on the part of the public and on the part of Government, that the exchange value of the rupee should be stabilised as early as practicable, and made, so far as possible, independent of Government control." Have you in mind principally the independence to be obtained by making the system of stablisation automatic, or rather by transferring the actual control of the system from Government to some other authority?—I was not referring to the latter point. What I was referring to was the inconvenience of the present system in which, without a stabilised exchange, Government is practically the only authority which can affect exchange by increasing or decreasing currency. The whole onus is thrown on the Government owing to the temporary difficulties of the present unstabilised system. I was not for the moment thinking of the question of the Imperial Bank.

733. You were referring to the removal of Government control by making the system automatic?—Yes.

734. Do you regard this public demand for an independent system as a conspicuous feature of public opinion in India at present?—Yes, I think so.

735. Now, continuing the general aspects of stabilisation, let me ask you a general question. In your opinion, is the present moment an opportune one for taking measures for the stabilisation of the rupee?—Yes. Of course, in a matter of this kind the opportunity of forming a judgment out here is naturally limited, because it depends on international factors of the greatest importance on which we have insufficient information here. But assuming that the most important factor which has occurred in the last year, namely, the return of the United Kingdom to the gold standard, is a permanent one, and also that other countries which have been able to go back to the gold standard can remain there, I think it clearly seems to be a favourable opportunity for India to follow suit by stabilising her exchange. It depends on a right judgment as regards the permanence of those factors and the likelihood of other disturbing factors not arising, such a factor, for instance, as financial crisis in France. We, here, are not really in a position to form a judgment as to how far world conditions are secure. But, so far as we can form a judgment, I should answer in the affirmative.

736. You say towards the end of your first paragraph: "The fixation of the rupee exchange in terms of gold necessarily means that world changes in the value of gold—and in particular the monetary policy in the United States of America . . ." What had you in mind in that reference?—What I had in mind was that once exchange is fixed, of the three factors which have to be considered—international prices, internal prices and exchange—one will be completely out of your control, namely, international prices; the intermediate link that is exchange will be fixed; therefore the remaining factor, internal prices, will be at the mercy of outside movements, and it will not be in your power to control the situation. Supposing that the monetary position in America were to lead to an increase in the value of gold, prices in India would be directly affected.

737. Assuming on the one hand that it is desirable that the rupee should be stabilised and on the other hand that it is undesirable to attempt to stabilise it while the situation is still liable to such disturbances as those which frustrated the recommendations of the Babington-Smith Committee, is there in your opinion, any event foreseeable for the determination for which it would be worth while to wait before fixing the rate of the rupee?—I cannot think of any such event.

738. (*Sir Reginald Mant.*) If you had reason to anticipate any considerable rise in gold prices, would you consider it advisable to stabilise the rupee at present? Would you contemplate with equanimity the possibility of a further rise or any considerable rise in internal prices in India?—If the contingency were really a dangerous or an imminent one, I should prefer to wait.

739. (*Professor Coyajee.*) I put to you one argument which has been often advanced at the present time,—that we have had a series of good harvests in India. By the law of probabilities the opposite state of affairs may come to pass soon. Therefore, should we not wait for a year or two before we stabilise the exchange?—I think I should answer that in the negative. I do not know how the law of probabilities applies to harvests, but we have gone beyond the normal period already and we might have to wait indefinitely.

740. (*Chairman.*) Now as to the rate. Assuming that the rupee is to be stabilised, what rate should be chosen? I want to ask you a question in particular as to the effect of various rates upon the Budget. In your memorandum at page 5 you say that if the rate were to be raised too 1s. 8d., that would be of benefit to the Budget?—Temporarily.

741. Were the rate to be reduced to 1s. 4d., I understand that that would be a temporary burden on the Budget?—Yes.

742. What is the total immediate additional burden which, in your opinion, would be cast upon the Budget by a reduction of the rate to 1s. 4d.? I have added it up according to your figures here. It appears to me that your figures give a total of 5 crores 88 lakhs?—Yes. That includes both the railway figures and the capital expenditure. That would not be the measure of the burden on the Revenue Budget. The measure of that burden would be 316 lakhs, unless it were then argued that the railway contribution to the general Budget was too high; the Railway might in that case want re-consideration of the separation terms which were recently agreed to. But, supposing that does not take place, the actual loss to the revenue would be 316 lakhs and the remaining loss would be capital loss distributed between the railway and the general Budget. These figures, I should also mention, do not include the figures of the Provincial Governments which are relatively small. The average sterling expenditure of the Provincial Governments on capital account may be taken at approximately £500,000 and the revenue expenditure at 2 millions. The extra burden in the case of the Provincial Governments would be 8 lakhs in respect of capital and 33 lakhs in respect of revenue. The total loss is round about 6 crores, which I think is the figure given in one of the memoranda supplied by the India Office.

743. You contemplate that the effect on the Railway Budget would be such as to require an increase in the rate or some other alternative; so there would be a burden on the public though not in the form of increased taxation?—I think it quite possible that the burden might be in the form of preventing a reduction in fares of which there is a possibility in the not distant future.

744. Finally on the question of stabilisation, would you tell us generaly what are the reasons for the opinion expressed in the final paragraph of your memorandum in favour of accepting the present position of 1s. 6d. to which you attach special importance?—I regard the question purely as a matter of

adjustment, that is to say, which rate will cause the least disturbance. I think it is a question of choosing the lesser evil, if I may say so. I am fairly confident, although it is very difficult to prove, that the adjustments necessary at the present rate will be less than at a rate either above or below it; and among the adjustments I include the adjustment of the Government's Budget. That Budget has been balanced on the assumption of a 1s. 6d. rate. That adjustment has already taken place at 1s. 6d. and a re-adjustment of the Government finances would be one of the big readjustments required by an alteration of the rate either above or below.

745. I understand that, in view of your special responsibilities, your obligation is to look at the matter, primarily at any rate, from the point of view of the national finance?—If it could be perfectly established that an alteration in the rate, higher or lower, would really confer great and lasting benefits on the country, the position of the Government finances would naturally be a subordinate consideration, but personally I do not believe that merely by altering the external level of your country's currency you can effect any permanent improvement in its material wealth. If that could be proved, I think it would weigh very heavily against any argument based merely upon Government finances.

746. Then, as I understand, the general effect of your answer is this, that to adopt any other rate than that which at present rules would entail disturbances, in the first place to the Budget, and in the second place to trade and industry (including agriculture) which would have a harmful effect, and it is only by accepting the position as it exists that you can avoid such disturbances?—I think the disturbances will be less if we accept the present rate. It is, I think, a choice of evils. The adjustments are probably not quite complete even at the present rate, but there would be less further readjustment with the present rate than with any other.

747. Let me ask a question which I should logically have asked at some other stage, and that is whether in your opinion Indian prices have adjusted themselves to the present 18 penny rate?—So far as one can judge from recent figures, the downward adjustment has gone some distance. Comparing Indian with sterling prices, and allowing for the great increase in the Indian customs tariff since the war, I think there is a general indication that prices have adjusted themselves although I never like to press an argument from index numbers too far. The statistics of prices are, I am afraid, in this country somewhat incomplete. The Statistical Department has been rather starved of funds. But in connection with prices there is a publication which I should like to bring to the notice of the Commission, that is, the figures of wholesale and retail prices which are published every fortnight in the Gazette for nearly every district in India. This publication gives you the retail and wholesale prices of the principal food-grains in use by the people. I have not attempted to make any tabulation of the figures but if the Commission desired it, this could be done and some inferences might conceivably be drawn therefrom. The figures reflect very closely the seasonal position; for instance, most of the food-grains which are grown in the autumn are now standing a good deal higher than a year ago, which is due to the comparative failure of the late rains in August and September as compared with last year. From this I think some indication of the changes in the cost of living as affecting the ordinary poor man could be obtained. There are also statistics which have been prepared by the Bombay Labour Office which give some indications as to the movements in agricultural wages. They seem to prove that although prices have fallen a good deal from their highest point the condition of the agricultural labourer has been steadily going up, and even the general fall in prices this year has not prevented a further small rise in the wages of the agricultural labourer in the Bombay Presidency. What I was trying to emphasize was that there are so many counteracting factors which affect the position—*e.g.*, the state of the monsoon in a particular year—that it is very hard to draw any general conclusion which will be universally applicable to the whole of India as to whether prices have moved in a particular direction or not. That is why I find it very difficult to give any definite answer to the general question, how far they have really adjusted themselves.

748. Taking the Calcutta index number for what it is worth, that would clearly indicate that prices were adjusting themselves. Can you base any conclusion upon these figures as to whether the process is completed or whether it is still in progress?—The figures would almost indicate that the process is complete but it is I think dangerous to press index numbers so far as to argue within a small percentage and an error of even 5 per cent. would affect one's conclusion considerably.

749. You suggest that we should consult the Government of India's return of fortnightly prices in various districts: can you suggest any other source of information which would throw light upon the question of the adjustment of Indian prices besides the index numbers to which you refer?—I think not, apart from the figures prepared by the Bombay Labour Office which are the most up-to-date in India. They have "cost of living" figures and they also have separate inquiries regarding the condition of the agricultural population. This is a book which originated in inquiries made by Mr. Findlay-Shirras and the figures are kept up-to-date.

750. The Labour Gazette, published monthly by the Government of Bombay, is one of the publications to which you refer. As regards the cost of living index, there is another special publication dealing with agricultural labour in the Presidency?—There is another publication dealing with wages in the mill industry.

751. (*Sir Reginald Mant.*) You said that the Government of India's Budget had been adjusted already to a 1s. 6d. rupee: that adjustment has been affected by a considerable increase in taxation, has it not?—Yes, certainly, a very large increase in taxation.

752. You think that taxation is undesirably high? —I do.

753. The adjustment has not been completely effected, and the Government of India have not fully discharged their obligations to the provinces?—I agree. There are still 733 lakhs of provincial contributions which have to be wiped out. The excise duty on cotton has also been definitely accepted as an obligation, so that the adjustment is Rs. 40 to £3.

754. With regard to the 1s. 6d. rate, do you consider that a convenient figure for purposes of conversion?—It is not a perfect figure; it is 13⅓ Rs. to the £. It is not however so inconvenient I think that this need weigh very much in the decision. It is Rs. 40 to £3.

755. It is not as convenient as 1s. 4d. or 1s. 8d.; if you want to change £1, you have to go down to pies? —Yes.

756. You cannot suggest any figure in that neighbourhood which would be an improvement in that respect?—There is nothing between 1s. 4d. and 1s. 8d. which is really any better.

757. Rs. 13 to the £, for instance?—I think it introduces other complications, *e.g.*, in the expression of the rupee in pence.

758. (*Sir Purshotamdas Thakurdas.*) It would appear from what you have said that the figure of 1s. 6d. was hit upon more by coincidence than by any sort of set purpose. It happened to be the rate ruling just before the busy season started and it happened to be ruling when the Finance Department made up their mind that they would stop any further rise in exchange. Then the argument that you urge in your memorandum regarding any change from it, upwards or downwards, would apply the same way to any rate at which the Government of India may

have stopped, say 1s. 5d. or 1s. 8d.?—I agree, except that I do not think that the Government of India would ever have contemplated going up to 1s. 8d., because the monetary position in the country would have been very much upset and also the industrial position. I think one can rule that out as a practical impossibility.

759. Take 1s. 7d. or 1s. 5d.: and suppose the Government of India had decided that exchange should be stopped from going any further: the same set of arguments that you put forward in your memorandum against any change from the present level could have been urged and would have been urged by you?—I certainly agree that the figure might have been 1s. 5d. Then you would have had a different budgetary position; otherwise there would be very little alteration.

760. Then was this figure adopted from the point of view of your Budget?—No.

761. Therefore the budget position did not enter into your consideration when the Government of India stopped at 1s. 6d. That did not form part of your aim?—We did not fix on 1s. 6d. definitely for purposes of the Budget. One was, of course, very glad to be able to get rid of 2½ crores of provincial contributions last year. But if exchange had been stopped at 1s. 5d. we should have done our best.

762. The Budget situation did not weigh with you at all, and, judging from what you have said in reply to the Chairman, the 1s. 6d. rate happened to have been a mere coincidence as being the rate which prevailed at the time and very largely an accident?—We were not considering the Budget in October.

763. Therefore, whatever the rate selected might have been, you would have to advance the same arguments against a change from that rate, whether it be 1s. 5d. or 1s. 7d.?—If exchange had been held for a prolonged period at 1s. 5d., I should certainly have argued that 1s. 5d. was the best rate.

764. If it had gone up to 1s. 7d., would the Government of India have moved in the matter of stabilisation? If the rate to-day were at 1s. 7d., for example?—I do not think the situation would have arisen; we should hardly have allowed exchange to rise to 1s. 7d.

765. With regard to what you say in paragraph 3 about increase in prices ,would the same be correct if prices went down six months or a year hence? If, for instance, they went down from the present level by 12 per cent.?—We are now 60 per cent. above the pre-war level.

766. Take cereals, pulses, and the articles which are consumed locally, including wheat. You are above the pre-war level, and my question is, in judging whether the cultivator can stand any artificial check from sharing the rise in other parts of the world in raw materials, did the Finance Department enter into any calculation as to what the increased cost to him was?—We have considered the question of agricultural cost. I was examining in that connection in the Bombay publication first referred to the increase in the wages of agricultural labour. But it is very hard to say whether this increase in cost is compensated for by any improvement in the actual work of the labourer. There is some evidence that the condition of the agricultural labourer has improved. How far he is doing better work it is very difficult to say, but in actual money wages he seems to be somewhat better off than before. The position of the agriculturist also would appear from this same publication to be on the whole better in the Bombay Presidency than it was some years ago.

767. As regards what the agriculturist gets for his raw produce, he has to pay something additional for labour and the balance is his increased margin?—I was referring particularly to paragraph 29 of the publication which contains the opinions of a number of experienced officers who examined the conditions, in the various districts, of the agriculturist and the agricultural labourer; there is also a great deal of information in the census reports.

768. You tell us in the last sub-paragraph of paragraph 3 why in your opinion any rise higher than 1s. 6d. would be undesirable; you also tell us why any decline would be undesirable. The difference between the two as it may strike one is that in one case while you say that a rise above 1s. 6d. would prejudice the cultivator, when you talk of the lower rate it is not the cultivator or the producer that you consider, but the Central Government?—I was considering the country in general. The producer would benefit temporarily, no doubt, from a fall to a lower rate, that is, some classes of producers. There are producers of different classes, those who work their own land, those who do not and who are unable to get the benefit of their whole produce, and you have got to consider a very large number of different interests before you can say how far a rise in prices or how far a fall in prices would injure them.

769. May we take the most numerous class of producer: what happens to him?—I do not know which is the most numerous class. Perhaps they are those who cultivate the land as tenant and have very little surplus to sell, but live on their own production. They would, I think, be practically unaffected.

770. (*Sir Alexander Murray.*) In your opinion the largest and most numerous class of producer is unaffected by exchange, whether it goes up or goes down?—Certainly in the long run, and even temporarily I think the majority would not get any very great benefit. They are all consumers. If they had any available surplus, they would have to buy something.

771. (*Sir Purshotamdas Thakurdas.*) Then the argument against the 1s. 8d. rate is not very strong? If the majority do not benefit by 1s. 4d., they would suffer by 1s. 8d.?—The movement to any different level does create disturbances. During that period there is a disturbance, but ultimately it does not make any difference to the class which lives on its own production whether 1s. 4d. or 1s. 8d. is adopted; there will be very little difference, practically negligible.

772. For all practical purposes, whatever the level of exchange, it would in your opinion make no difference?—With the qualification which I have made in the memorandum that the gap between the present rates and some other rates might be so large that the disturbances would be so great that they could not possibly be faced. The disturbances in the immediate period in making a big change from the present rate would be so great that such changes can be left out of account as not being within practical politics.

773. Regarding the gain to the Central Government, could you tell us what was the amount that the Central Government gained when in 1920 exchange was fixed at 2s., and why while it was 1s. 4d. actually in 1920 Sir Malcolm Hailey got it fixed at 2s.: can you tell us to what extent India gained by that change in the statutory ratio?—I think there is a misunderstanding here. The amount that you gain does not depend on the rate that you put in the Budget, but the rate that you realise. The rate realised was not 2s.

774. (*Chairman.*) What would the difference in the sterling expenditure have been if it had been a 1s. 4d. rate instead of the rate which was actually obtained in the year 1918-19?—There was an actual deficit in that year, of course.

775. But still you must have gained in your remittance owing to the exchange that was available being higher than 1s. 4d.?—Yes. The deficit was reduced by the difference in the cost of sterling expenditure. I will have a statement worked out to show the amount of the gain.

776. (*Sir Purshotamdas Thakurdas.*) Have you any figures with regard to the statement that you make in the last sub-paragraph but one of paragraph 4?—I made a calculation for the first five months of the present year from April onwards, and taking the

import duties alone the amount assessed *ad valorem* was 57 per cent. Taking the import and export duties together, it was 51; the rest were all specific.

777. Would you not by a lower exchange get a higher return on those assessed *ad valorem?*—Certainly, you would eventually, if prices rose and the volume was not decreased.

778. What would be the amount roughly in rupees?—I should have to work it out. A statement could be prepared showing the actual money difference between 1s. 4d. and 1s. 6d. of the customs duties on an *ad valorem* basis, assuming that the amount of imports is not decreased and that prices rise by the full difference.

779. In the second sub-paragraph to paragraph 5 you refer to bad monsoon and exchange; would it be a fair inference to make from what you say in the latter part of that paragraph, that the lower the rate of exchange, the safer would be the calculations for the Government of India's Budget in the normal cycle of years in India? Take a ten-year period?—Yes, I was dealing there with the adequacy of Government's resources to meet a financial crisis, and certainly the lower the exchange, the less the drain would be, to some extent.

780. Therefore for purposes of the Central Government's Budget a higher exchange may cause an undue strain to be put on the resources of the Government of India?—The real risk of a breakdown is, I think, remote so long as your resources are sufficient; but there does arrive a point when, if exchange is fixed very high, the effort to establish it may involve a risk to your sterling resources. I have prepared figures elsewhere dealing with the question of the actual drain. But I agree generally that the higher the rate which you attempt to establish the greater the possible drain upon your sterling reserves.

781. You say in the last paragraph of your memorandum—"Finally, it may be said that in view of the change in the price level since 1914 . . ." etc. This practically gives the impression that you think the ratio of one country could be changed should it suit either the Government or any special cases that may arise. Would that be a correct construction?—No, I think it is hardly a correct inference. What I meant was that ever since 1914 there have been disturbances quite outside Government's control, which have affected debtor and creditor, and creditor and debtor, far greater than anything which can be caused now by the fixation of exchange. The price level is the main factor that has altered and there have been price levels in between very much higher than the level now; there has been a constant maladjustment and this occurs even in normal times: injustice is constantly being done to some one or another through variations in the price level; but the maladjustment in the period since 1914 is so great that there is no sanctity, in my view, in one rate rather than another.

782. The maladjustment you refer to has been all over the world?—Yes.

783. And if there has been any maladjustment in India that is because world conditions prevailed and nobody could possibly have stopped it: has any other country in the world changed its ratio since the war?—Many have. The majority who have gone back to gold have tried to go back to their pre-war ratio; some, such as Germany, have not; I am aware of several that have adopted different ratios.

784. In one direction you mean? Some have changed it in the other direction? Those of course whose currency system broke down could not help doing so; they had to do it; but I do not know of any country which had a sound system of finance behind it which even thought of changing its ratio as the Government of India propose to do: am I correct in that? Is there any information that you could give me which might make me feel that I am incorrect?—I am not aware of any country which has attempted to stabilise at a higher rate; many have stabilised at a lower.

785. (*Chairman.*) As regards the effect of a change of rates of exchange on the cultivator, I understand you to argue that if as a result of the change of exchange rate the cultivator gets more for what he sells he also pays more for what he buys?—Yes.

786. If he gets less, conversely, he also pays less?—Yes.

787. Therefore after the period of adjustment, whatever effects it may have ultimately, you can effect no substantial change in the position of the cultivator by a change in the rates of exchange?—Yes.

788. That is perhaps a fair summary of your argument?—Yes.

789. (*Sir Henry Strakosch.*) With regard to the question of stabilising; I believe it was in October of last year, with the rupee at 1s. 6d., you were guided you said mainly by the fact that if you had not fixed upon a definite rate the risks were that the rate would have gone up at that time materially higher than what it was and that that would have caused a material disturbance. May I take it then that you were also guided by the fact that at 1s. 6d. a fairly large measure of adjustment had taken place between internal and external prices and that if you had allowed the rate to go up, a new adjustment would have had to take place with a corresponding disturbance of economic conditions?—Yes, I think that is correct.

790. You wished to avoid widening the gap of adjustment?—Yes.

791. And would you agree that for all practical purposes nobody benefits as soon as the adjustment has taken place?—Broadly speaking, I think that is correct.

792. That is to say, that any benefit accruing to any particular section of the community is confined to the period while the adjustment is taking place?—Yes.

793. And when the adjustment has taken place you may expect, except for long term debts, like land tax for instance, no benefit accrues to anybody?—Yes.

794. One thing I was not clear about in your explanation, and it is this: you said the higher the point at which you finally fix the exchange, the greater would be the risk of a break-down or rather the more difficult would it be to maintain the rate at that high level: would you say that it is more difficult to maintain it at the higher level when once the adjustment has taken place?—I was not considering the period after final adjustment. I was thinking of the immediate position, on the supposition that we fixed exchange, say, at 1s. 8d. and a period of extreme weakness of exchange ensued. It would be easier for us probably to establish 1s. 6d., even if exchange weakness occurred than it would be to establish 1s. 8d. I was not considering the ultimate period after adjustment.

795. In other words, what you were afraid of is that an adjustment of prices at a level which is materially below or above the level at which exchange stood would be more difficult and therefore there would be a greater danger of failing to maintain the exchange value at that point?—Yes.

796. (*Chairman.*) In short, if prices are adjusted to the present level the adoption of another level involves a disturbance, and the further the difference between the present level and the other level adopted, the bigger the disturbance involved?—Yes.

797. But once the new level is reached and a fresh adjustment of prices arrived at to the new level, then of course the new rate is as easy to maintain as the old?—Yes.

798. (*Sir Henry Strakosch.*) You mention that little reliance can be placed on the indices which are being prepared in this country. Which authority

prepares these indices? Are there any private institutions who do this?—I am not aware of any private institutions; the Government indices are prepared by the Director General of Commercial Intelligence, and under him there is a Director of Statistics; they are under the Commerce Department. They prepare the Government of India statistics.

799. Do you see any great difficulties in preparing a scientific index upon which as much reliance could be placed as upon indices prepared in other countries?—I think it is more difficult in this country owing to its size and owing to the enormous variety of conditions in the different provinces. I think that our index could be improved no doubt, but I think that the conditions are more difficult here than elsewhere.

800. But you see no insuperable difficulties in preparing an index?—I think an index number for the whole of India would be misleading; I think you really require index-numbers for particular areas; the conditions differ so enormously in different parts of the country.

801. (*Chairman*.) I shall now turn from the question of stabilisation to the question of the currency system for India. I may say that the memorandum is so full and clear that it will be unnecessary to deal with the matter from the beginning; the memoranda are based upon a comparison of three possible standards, the sterling exchange standard, the gold exchange standard and the gold standard. I would, if I may, just ask you some general questions which will give you an opportunity of supplementing the memoranda in any manner which you think is desirable, and in particular to show the Commission upon what considerations you lay particular emphasis. There is one proposal which is common to all three possible systems, and that is the proposal for the transfer of the control of the note issue to the Imperial Bank of India, coupled with a proposal for amalgamation of the reserves. Would you then tell us in general what your view is as to the desirability or the reverse of the amalgamation of the paper currency reserve and the gold standard reserve?—I think that in theory at any rate it is desirable to have a single reserve. I think it depends entirely on what system you eventually adopt. The system of gold exchange standard which is outlined in our memorandum contemplated the continuance of a separate reserve, only under a different name—a reserve for redemption of rupees. It really was a continuance of the gold standard reserve, fulfilling, not quite all the functions of the existing gold standard reserve, but more or less in substitution for it. That scheme therefore kept a separate reserve apart from the paper currency reserve. In the memorandum which Sir Basil Blackett has submitted separately I see that he contemplates amalgamation of the reserves in all cases, but that is not a feature of the first memorandum in which I to some extent collaborated. If the pre-war system were retained I think that the gold standard reserve might be very well retained as at present. The point to which I attach importance is more the amalgamation of the currency and banking reserves of the country.

802. That is the second question I come to. In your view is it possible to make any scientific definition of the difference between the purposes for which the gold standard reserve and the paper currency reserve exist?—I think it is difficult. I do not think that any real definition has been attempted so far, but the gold standard reserve is mainly to provide for occasions when there is weakness in exchange, and it is used mainly for that purpose. Logically, however, I think the reserves ought to be one.

803. And the practical aspect is that if they both serve a double purpose, then by maintaining the difference between the two reserves, as I understand it, neither is so completely available for either of the purposes which it has to serve as if they were combined?—Yes.

804. In the memorandum, I think, of Mr. Denning, on the gold standard, emphasis is laid upon the difficulty of combining the reserves owing to the difficulty of fixing any definite relation between the gold standard reserve and the liabilities which it exists to support. On the other hand one observes that in Sir Basil Blackett's memorandum on the Indian Currency System these difficulties are at any rate not looked upon as insuperable. What is your view upon that?—The difficulty is, first of all, that of obtaining anything like a correct figure for the amount of rupees outstanding, and secondly, the variation in the price of silver which makes the contingent liability vary from time to time. The position taken by Sir Basil Blackett, as I understand, is that although that is so you can safely take an outside figure which will be good enough and be quite on the safe side. The question of the amount of rupees outstanding is a very important one which arises in another connection also, in connection with the possible amount of rupees which might be returned in the event of your undertaking the obligation to give gold.

805. That is a question which I shall ask specially later. But as regards the present question?—I think that if you are prepared to accept an outside figure, the difficulties are not insuperable. I feel fairly confident myself that 350 crores is an outside figure, including Government's holding in the reserve.

806. Now, to complete the picture, let me ask you a general question as to what is your view as to the desirability or otherwise of the transfer of control and management of the note issue to the Imperial Bank?—I am strongly in favour of the transfer. The reasons are practically those given on the first page of this memorandum. The one to which I attach the most importance is that of both reserves, the banking and currency reserves, being under the control of a single authority. It is not merely an academic point; one could in practice give instances where difficulties either have arisen or have very nearly arisen owing to the existence of three distinct authorities controlling the reserves.

807. I think it would be of very great interest to the Commission if you could tell us any practical instance of the sort to which you have just referred?—I will give one. Take this last October. There was no difference of opinion between the Government of India and the Secretary of State as to the policy to be adopted in increasing currency when necessary during the busy season, but there might have been. I merely say that that is a particular difficulty that might have occurred, but did not. But at the end of October our Government balance in the Imperial Bank was just about 7 crores, which was fairly low; in the first week of every month there are always very heavy withdrawals for payment on Government account, for salaries to their officials and so on. The amount of the drop may be as much as three crores in the first week of any month. The practical point for decision which arose was how far the Government should put in extra currency during that week to increase their balance, and how far they should let the balance go down. The Bank's point of view, which was accepted by Government as right and correct, was that they should not put in more than one crore. The position of the bank was that if Government had done more they would have given what you might call an artificial appearance of easiness to the money market; they were able themselves to foresee what their coming liabilities were, how soon the cotton crop was likely to come on, and how far the business community would or would not be misled by any artificial appearance of ease at that time, which would be purely transitory. For that reason they advised us accordingly, and we accepted that advice, and instead of putting in 2 or 3 crores as we originally contemplated, we put in one crore. I am giving this instance, not because any difference of opinion arose, but because it could very easily

have arisen if we had rejected that view and put in more currency; we should have had a direct difference of opinion with the bank which would have affected their policy as regards their bank rate. That is an actual instance in which no actual conflict of opinion arose, but very easily might; and the exact opposite is very likely to occur in the busy season when the bank may want us to increase currency faster than the Government think desirable. The Bank was to watch the money market and the bank rate, and they have to carry us with them and differences of opinion may arise in practice.

808. And the responsibility of being able to affect such a situation is a responsibility of which you would be glad to see the Government of India rid itself?—Certainly. That is the first reason why a change is advocated, namely, the avoidance of friction between the different authorities. The second is that I think there is a possibility of the Imperial Bank, if it were in charge of both the currency and banking reserves, being able to reduce, to some extent at any rate, the fluctuations in the bank rate between the busy and slack seasons of the year. That certainly was the opinion of Mr. Keynes, and he put that forward in his memorandum regarding a State Bank. We have tried to work it out in the Appendix to this memorandum to show how the rates could be kept under control if both reserves were under one management.

809. That would be the result of the consolidation of the currency and banking reserves of the country, thus rendering the total value of the reserves more readily usable?—Yes.

810. Expansible and contractible for the purpose of the country?—Yes; those, I think, are really the two main factors. There are others. It has been argued, again by Mr. Keynes, and accepted by the Government of India in 1900, that a bank in charge of the note-issue would have greater facilities for developing and making popular the circulation of currency notes. They would be able to regulate the facilities for encashment and so on more quickly and more easily than when they have to make reference to Government. On the whole, I think there is probably something in that. They would be able probably to push the note-issue rather more than we are able to do. Another point which would be very much easier would be the arrangements for seasonal currency. At present, it is more or less an extraneous system; but if the reserves were amalgamated it might be made part of the ordinary statutory arrangements governing the currency reserve.

811. That is not quite clear to me?—In the proposals we have put forward for the bank taking over the reserve, it is contemplated that in certain circumstances they can increase the investment portion of the reserve on payment of a tax to Government. That would practically take the place of the present system by which we allow the bank to borrow from currency against bills of exchange. It would form part of the arrangements of currency instead of a separate arrangement grafted on it.

812. The present system is to make use of the unused margin of the fiduciary issue and instead of that you would have a more characteristically banking system by which the bank would have that work?—It is practically the same system as is adopted, I understand, in a good many other central banks, that they can reduce their cash percentage below the minimum ordinarily fixed, by payment of a special tax to Government.

813. So that instead of continuing a rather crude arrangement of a maximum fiduciary issue of which a margin is still unemployed, you would have the more scientific arrangement of an extensible margin, an elastic margin, of fiduciary issue, which can be expanded or contracted according to the needs of the season?—Yes. And finally there is one further argument perhaps; that is, the arrangements for Government remittances to London could be simplified if the bank were given control of the currency as well as the banking reserves. We contemplate a system, which should be exceeding simple, in which you practically impose the responsibility upon the bank, subject to due notice, of providing funds in London.

814. Is it relevant in this connection to refer to the circumstance that the Government of India has already, under the existing arrangements, adopted a system of remittance which would be more normal in banking practice than the old system of council drafts?—Yes; I think it is, but it is less simple than the system we would like to see.

815. The system which you would like to see differs only from the present system in that the remittance will be carried on by the Imperial Bank and not by the Government?—Yes; at present we give limits both of amounts and of rates, and the bank simply acts as our agent; in the other system you would be calling upon the bank, so long as you give them due notice, and they would not remit at any particular moment at all; they would make their own arrangements throughout.

816. It would be an essential part of the exchange system that there should be limits?—Some arrangements would have to be made as to the rates to be applied. We were contemplating taking something like a monthly average rate based on actuals; it would be near enough in the long run. There is a monthly figure which we use now for certain purposes which is fixed in consultation with the India Office.

817. (*Sir Henry Strakosch.*) I wish to ask whether you agree with Sir Basil in thinking that the proposal which he puts forward in his latest memorandum on Indian Currency with regard to providing a reserve of one rupee in respect of every four rupees issued to the public of new currency is adequate?—I think the figures taken by Sir Basil are adequate.

818. And do you regard the system as one that could easily be worked and preferable to the one proposed by Mr. Denning which is much more complicated?—I have really scarcely formed a judgment as between the two systems; I have only seen Sir Basil's system quite recently; it has certainly attractive features.

819. (*Sir Reginald Mant.*) You said that you preferred not to amalgamate the two reserves?—That perhaps is going rather too far. I think, if we were retaining our present system without change, you could justify retaining them separately.

820. If we were to retain practically the sterling exchange system?—Yes.

821. If you had the gold standard reserve kept as a separate reserve, would you not introduce some arrangements for contracting the currency when you operated against it? At present I understand that when you draw on the gold standard reserve you do not contract the currency and it fails really to achieve its main object?—That is so. That is one of the reasons why the operations in 1920 were ineffective.

822. Could you devise machinery for removing that difficulty?—It could be done, I suppose.

823. Do you not think it would be necessary to do that?—I think it would be desirable if the present system were retained.

824. (*Chairman.*) Before proceeding to ask you some general questions about the various alternatives that are developed in your memorandum, I think it is natural to call your attention to the defects in the present currency system in India as specified in one or two of the memoranda submitted to us, and to ask you your opinion as to the remedying of those defects. I refer in particular to the memorandum of Mr. Denning on a gold standard for India in paragraph 2, where those defects are analysed. The first reference is to the defect in the system of the high silver bullion value of the rupee as affected by possible changes in the price of silver. I should like to ask you a question in this form—whether you consider that the proposals for the limiting of the position of the rupee as legal tender

would themselves remedy completely that defect in the existing system?—The answer is, "No." They would certainly not remedy it completely, but they would, I think, make the problem more manageable. In the event of a situation arising in which the bullion value of the rupee rose above its exchange value, the position would be that there would be a more limited number of rupees circulating which would begin to be melted down. It would be easier for Government in any circumstances short of a world crisis to meet the demand for currency by re-issue, for instance, of the one-rupee note as one of the steps, or by issuing a coin of reduced metallic value, possibly a two-rupee coin. Our proposals would certainly not eliminate the danger, but they would make the danger somewhat easier to be dealt with.

825. The argument, I take it, is that it is common ground at the present time that the reduction of the silver value of the rupee or the substitution of any other form of more economic coinage, nickel or silver, for the rupee would be attended by insuperable difficulties?—Yes, I think so.

826. That is because of the dependence of the population under present conditions on the silver rupee as the familiar basis of their confidence in currency values?—Yes.

827. Then I take it the argument continues that that objection would disappear after the population had been given an opportunity of substituting some other form of more suitable currency for the rupee? —Yes. It is, in short, what Sir William Meyer said to the Babington-Smith Committee, more or less, in the same connection. He said: "If you are going to reduce the rupee to a mere token coin, then you must have some other suitable medium. You must have your sovereign." That is, you must give some other currency of intrinsic value before you can limit the legal tender position of the rupee.

828. Anticipating somewhat, we have been told by Sir Basil Blackett that he allows for a continuous circulation of some 150 crores of rupees for the purposes of small coinage?—Yes.

829. Quite apart from theoretical considerations, if one is to consider the social reactions on a populace uneducated in currency matters, do you think that, even under the conditions to which you have referred which would prevail after the establishment of the gold standard, there would be any likelihood of any grave social disturbances as the result of an attempt to substitute a currency of less intrinsic worth for the rupee in order to meet the change in the silver market?—I think that there would be very much less likelihood of serious social disturbance, provided that another coin of intrinsic value had been made available. I think that a certain amount of social disturbance might occur even in these circumstances, but I think the problem would be a good deal less acute than the problem which had to be faced during the war.

830. You perceive, no doubt, that the difficulty which suggests itself to me is that for all the purposes for which this 150 crores is used, the fact is shown that the other coinage is not readily available because it is too large in dimensions?—Yes, that is so; although I think that the other coin would be taken in a great many cases if it were available and if the rupee were not available. There is a good deal of information on this point in the 1913-14 report by Sir Henry Howard when Controller of the Currency. He went in great detail into the question of the popularity of the sovereign, and there is one statement of his which bears on this point. He says: "On the whole, it may perhaps be fairly concluded from this evidence that the popularity of the sovereign as a medium of ordinary currency depends largely on the extent to which it is made available to the cultivator by the various firms and middlemen who buy up his produce, and that where it is so available in large quantities it is gladly accepted and used in everyday transactions."

831. Are there any supplementary questions on this question of the relation between the rupee and the silver market as a defect in the present system? Then, Mr. McWatters, the second defect in the present system, as set out in this analysis, is that under the present system the rupee is linked on to sterling and not on to gold. In view of the recent return of sterling to parity with gold in substance, what emphasis would you lay upon that as a consideration in devising an improved system?—It depends, Sir, I think, on the confidence one may have in sterling remaining in parity with gold. If one had complete confidence that it would do so, I think the emphasis need not be excessive.

832. Would you be prepared to express any opinion as to how largely this consideration bulks in Indian public opinion?—It is difficult to say. I think that the Indian public opinion would probably prefer a gold standard or a gold exchange standard rather than a sterling exchange standard. But it is very hard to speak for Indian public opinion generally. I think the Indian public opinion that is most widely expressed would certainly prefer it.

833. Is it possible to express any opinion as to the relative importance which public opinion here would attach to the elimination of this defect as compared with the differences of expense of the gold exchange standard and the sterling exchange standard?—I am afraid, sir, I could not express any opinion.

834. That involves no doubt a nicety of consideration which is perhaps beyond the possibility of the formation of public opinion under present conditions?—I am not quite certain what the relative difference in cost would be. If it is a large figure, it would make a considerable difference. But I should say that the preference for a standard based on gold is probably very decided in the minds of most Indians who have given much attention to the question.

835. The difference in cost consists in the difference in the expense of keeping a larger amount of gold under a gold exchange standard than it would be necessary to keep under a sterling exchange standard?—I understand that under Sir Basil's scheme you need keep no gold in the reserve under a sterling exchange standard.

836. Would you feel it possible to say that under a sterling exchange standard it would be possible to keep no reserve of gold at all?—Personally, I feel doubtful. I think that there is some difference between gold and sterling securities when it comes to their use.

837. What influence would it have upon your mind in that connection to consider the advisability of keeping a reserve of gold in order to avoid what I may call the full shock of sales in the security market, when you require to make use of your reserve under a sterling exchange standard?—I think a reserve of gold—a certain amount of gold—would be useful for that purpose.

838. So that, under any standard, practical considerations appear to point to the maintenance of a certain part of the reserve in gold?—I think so.

839. Now I will pass to the third defect in this analysis of the defects of the present system; that is the present system is deficient in its provisions for the automatic stabilisation of the rupee and the contraction of the currency. I understand that these defects, according to the opinion expressed in your memoranda, are equally remediable under any of the three alternative systems proposed?—Yes.

840. Just to make a matter perfectly clear which has been referred to already in your examination in reply to a question by Sir Reginald Mant, what arrangements would you propose for providing for an automatic contraction of the currency on a sterling exchange standard?—I think I said in answer to Sir Reginald Mant that I had not thought out any definite system, but that some arrangements were necessary if the system was to be logically complete. The system should impose some obligation on Government to contract currency rather than, as now, leaving it merely a

matter of practice; under the present system the action of Government has been, or could be, arbitrary.

841. Those arrangements would no doubt differ according to whether the note issue was controlled by the Government or by the Imperial Bank?—Yes.

842. Were the reserves amalgamated and the currency controlled by the Imperial Bank I understand that no special provisions would be necessary?—No.

843. On the other hand, if the reserves were maintained in a separate form and the control, or the partial control, of the gold standard reserve were retained in the hands of the Government, some new and special relation between the gold standard reserve and the currency in circulation would be required?—Yes.

844. Would it be easy to devise such a method in such a case?—The arrangements outlined for the reserve for the redemption of rupees are referred to in paragraphs 10 (sub-paragraph 5) and 9 of the Memorandum on Transfer.

845. The arrangements for meeting that contingency are suggested in paragraphs 9 and 10 (sub-paragraph 5) of Mr. Denning's Memorandum on Transfer?—The reserve is really described in paragraph 8—the use of it, the application of it. It is a somewhat complicated method of dealing with this difficulty, but short of the amalgamation of the reserve it suggested itself to us as one of the ways in which it might be dealt with.

846. (*Chairman.*) I am about to pass from this heading to the next subject. Are there any supplementary questions that members would like to ask upon these general questions?

847. (*Sir Henry Strakosch.*) I should just like to ask Mr. McWatters a question with reference to clause 2, sub-section (D); there occurs the sentence "but in so far as the sterling value of the reverse councils sold was obtained by drawing on the gold standard reserve, the amount of the currency in circulation was not affected." Would you please explain why the currency in circulation is not affected by the sale of reverse councils?—The payment for the reverse councils may be made by *borrowing* from the gold standard reserve. There would then be no reduction in the currency. The sentence quoted has actually been altered in the later draft so as to bring out the point more clearly.

848. But if no borrowing had taken place the currency would have been affected. If sterling securities from the gold standard reserve had been sold in India for rupees that would mean a contraction of the circulation?—Yes, if it had not been for borrowing from the gold standard reserve that would have been so. But the system of borrowing is resorted to when there would be practical difficulties in contraction, with the definite object of so arranging that there should be no contraction of the currency.

849. May I revert to a question I had intended to ask before? Would Mr. McWatters consider it essential in a gold exchange system of currency that gold should actually be held, remembering that the reserves should be held in currencies which are convertible into gold. To give an example, if a gold exchange standard were established and a part of the reserves were, for instance, held in the United States dollars, there would, of course, be no difficulty whatever in converting any balance standing to the credit of the reserve in New York into gold at any time. Or equally in Great Britain. Would you in these circumstances consider it nevertheless essential that there should be actual gold held in reserve, and, if so, for what purpose?—The only reason for holding gold is that it represents something that you might not be able to get by the use of your securities. In theory I do not think, provided you are satisfied that your securities are immediately transferable into gold, that there is any logical necessity for holding gold. But the question arises whether in practice the securities of any country could be realised in all circumstances as quickly and easily as gold. If one were satisfied on that point the answer is that gold is not logically required.

850. (*Prof. Coyajee.*) This practice of borrowing from the gold standard reserve when the balance of trade is unfavourable is an exceptional method. Generally the reverse councils are to be sold against the gold standard reserve and the price, the rupees obtained for the reverse councils are to be locked up. That is the idea of Lindsay and others?—That is so. It is in exceptional circumstances that it has been employed.

851. Generally, when the gold standard reserve is used, as it was intended originally, there would be a contraction of currency?—Yes.

852. (*Sir Reginald Mant.*) I would just like to follow up that point. You say there would be contraction of currency if the gold standard securities were sold for rupees in India. If those rupees are put back as part of the Government balance with the Imperial Bank, is there any practical contraction of currency? If you don't lock up the rupees in a separate chest, where does the contraction come in?—Yes, I admit that.

853. That is why there is not a contraction of currency—because the rupees are not really withdrawn. They go into the Government balance and become available for further credit. So really to make the contraction effective you would have to lock up the rupees?—Yes, I think that is so.

854. (*Chairman.*) Just to make my mind clear on that, to make the contraction effective you must adopt some regulation as to a relation between the reserve and the liabilities that reserve is supposed to support. If there is no such relation then there is no reason why the rupees received, as Sir Reginald Mant has pointed out, should not return into circulation through some other channel, and that is the intrinsic defect of the exchange standard as it has been constructed hitherto?

855. (*Mr. Preston.*) Mr. McWatters in 1907-8, at the time of the American crisis, when reverse councils were sold to the extent of about eight millions, the practice then was that when they were sold against the gold standard reserve the rupees received in return were credited to the Indian portion of the gold standard reserve?—That is so.

856. And that created the contraction which all along the gold standard reserve has been meant to fulfil?—Yes; the Indian portion of the reserve was subsequently abolished.

857. Yes, but that was always the method and the policy which it was understood would be carried out in connection with any reverse councils drawn on the gold standard reserve in England?—Yes.

858. (*Chairman.*) I now propose to pass away from the question of the exchange standard. Has any member of the Commission any supplementary questions to ask on the exchange standard? Underlying the memoranda which we have had for consideration Mr. McWatters, from yourself, and your colleagues one finds great emphasis placed upon the displacement of the rupee from the position of being a coin of unlimited legal tender. Will you tell us what, in your opinion, are the disadvantages of the privilege of unlimited legal tender as attached to the rupee, and conversely what advantages there are to be gained by limiting the rupee as legal tender?—The disadvantages, sir, are shown by the facts, I think, of history, which are evident from what happened in the war when the system broke down, when the bullion value of the rupee rose above its exchange value and exchange was made to follow upwards with it. That was the root cause of the breakdown of the Indian system, and, though that might or might not occur again easily, it is an inherent defect in the present system that it is liable to break down in circumstances of that kind.

It is not merely a theoretical but an actual defect. The second part of the question was, I think, dealt with in a previous answer. We hope, not to abolish certainly, but to reduce to a considerable extent the difficulty of dealing with a situation of that kind if it occurred in the future by being able to replace the rupees when they are limited legal tender more readily by other forms of currency should a crisis arise. I do not suggest for a moment that one can get rid of the difficulty altogether, but you can certainly reduce it and make it a more manageable proposition.

859. That completes the account given of the advantages and disadvantages referred to under the heading of the elimination of the uncertain factor of the silver market on the rupee. Are there any other substantial advantages which may be expected to result from limiting the position of the rupee as unlimited legal tender?—If one includes in that the establishment of a gold standard, some further considerations arise. What we were ultimately aiming at was a currency which would not have the rupee unlimited legal tender, and ultimately working up to a currency such as exists in England, if possible. If one could achieve that, I think there are other advantages one could mention.

860. Before we deal with that point let me ask you this question. Is it in your opinion possible to arrive at the limitation of the rupee as unlimited legal tender without the previous establishment of a gold standard?—Our view was that it was not possible. The rupee being used not merely as currency but as a store of value, it would be essential to make the change by giving in the interim a coin of intrinsic value—gold. It is only because of the peculiar nature of the Indian system, and because the transition could only be achieved in that way, that emphasis has been laid on introducing gold in the currency, which in itself is obviously uneconomical. It is merely because the Indian system has this peculiar difficulty that we thought it could not be achieved except through this stage. As was emphasised in the quotation I gave from Sir William Meyer's evidence before, it seems the only way to proceed in India. Historically, other countries, it is true, have made this step direct, but in India we have the peculiar problem of hoarding, and the fact that the rupee is used as a store of value. We felt that we had to give something of intrinsic value to replace these stores before anything could be done.

861. You have described as one of the features of recent currency history in India the very great increase in the circulation of notes employed, and a large increase in their use. That, I think, is a prominent feature of recent history, is it not?—Yes.

862. Would it be impossible to contemplate such a growth in the habits of the people as regards the use of notes as would lead to a dethronement, if I may use the word, of the rupee in practice owing to a process of education such as would make it ultimately possible to effect this limiting of the user of the rupee as unlimited legal tender without any intervening stage of the acceptance of the liability to give gold against rupees?—I think it would take a very long time. I cannot envisage those conditions for many generations to come.

863. Would it be quite unpractical to go so far as to suggest that possibly the process is actually taking place, as evidenced by the increase in the use of notes?—I think the process is taking place to some extent. The quotation I mentioned from Sir Henry Howard's report really bears on that point. I think that the ordinary Indian cultivator is very willing to take practically any form of currency that is given to him. To illustrate my point, might I mention something about the financing of the jute crop in Calcutta? The position there is that at the beginning of the jute season the Deputy Controller of Currency in Calcutta receives information from the Banks operating in the Eastern Bengal area and from the big firms who deal in jute stating the kind of currency they want. A few years ago they used to ask for notes, mostly Rs. 10 and Re. 1 notes. The cultivators in that area took quite willingly to the one-rupee note, and since the one-rupee note had been abolished they have been indenting very much more largely for notes of higher values and a much smaller proportion of silver than was represented by the old one-rupee notes. There is no difficulty in substituting for the old one-rupee currency notes of larger value. The expansion of the note circulation can thus be effected simply by giving currency in this form. The people are very willing, in some areas at any rate, to accept and respond to new forms of currency. And yet in this same report of Sir Henry Howard's of 1913-14 he stated that notes were not then taken at all readily for financing the jute crop. I am giving you now the history of 12 years afterwards to illustrate how rapidly the position has changed.

864. Before I leave that point, let me ask you a question which I should have asked before. In your opinion what would be the effect upon the acceptance of the note if it was an Imperial Bank of India note instead of a Government note?—I think it would be received without any distinction at all by the bulk of the people. I do not think any difficulty would arise. I believe that in 1900 the Government of India suggested the possibility of a double signature both by Government and an officer of the Bank; but in my opinion an Imperial Bank of India note would be accepted.

865. (*Sir Reginald Mant.*) One point I would just like to clear up in connection with the instance you gave us just now of ten-rupee notes taking the place of one-rupee notes. Was not that partly due to the fact that the one-rupee notes were done up in packets, and that it was one-rupee notes in this booklet form that to a great extent replaced notes of higher value?—The booklets did not really circulate in the sort of area I was speaking of. They were very largely used by the upper and middle classes in the towns. I myself used always to keep some. I now keep a few ten or five-rupee notes, and break into them when required. It is perfectly true that since the one-rupee notes have been abolished there has been increase in the use of notes of higher value by ordinary middle-class people quite apart from the financing of big crops like the jute crop.

866. But don't you think that the difference between ten-rupee notes and one-rupee notes and between ten-rupee notes and silver rupees was partly accounted for by the fact that when the one-rupee notes were used in place of the ten-rupee notes they tended to replace the ten-rupee notes?—I think the earlier history of the financing of the jute crop was that notes were extremely unpopular. The use of them was only gradually developed. When the one-rupee note was abolished, instead of sending up the equivalent amount of small coin, the firms and middlemen, as a matter of convenience, sent up a smaller amount of coin and the rest in larger notes. In no case has any difficulty been experienced.

867. Then you would answer my question in a really opposite sense: instead of the one-rupee note replacing the ten-rupee note, it led up to the extinction of the one-rupee note and increased the circulation of ten-rupee notes?—The circulation of ten-rupee notes has increased considerably since the one-rupee note was abolished.

868. (*Sir Henry Strakosch.*) You mentioned that the Indian system broke down because the bullion value of the rupee had risen above its normal value. That was the chief reason why the system broke down?—Yes.

869. Are you aware of any gold standard system which broke down for practically the same reason? Are you aware that in at least three of the British Dominions the currency broke down for the very same reason?—I think in one of my answers I carefully safeguarded myself by saying "except in a world crisis such as the war." I agree that in a crisis like that any system is likely to break down, and it is a question, on which however a different opinion was formed at the time, whether, if the

Indian currency had become inconvertible almost at once like those of other countries, we should not have escaped a good many of the later difficulties.

870. You agree, then, when we generally state that no standard, including the gold standard, is proof against an abnormal cataclysm such as the Great War?—I entirely agree.

871. I think that is a point which one cannot sufficiently emphasise, that even if India had had a full-fledged gold standard, with gold in circulation, notes being convertible into gold, the standard would have broken down during the war, just as it has broken down in South Africa, Australia, and New Zealand, where, I may perhaps add for the information of my colleagues, sovereigns, owing to the omission to suspend specie payments, could be demanded in exchange for notes, and these sovereigns, because their bullion value was higher than their face value, were speedily exported, and the country was left without any currency. Therefore, you have identical conditions in a full-fledged gold standard country practically as you had in India, and, therefore, if you introduce a full-fledged gold standard here, are you going to save the country in such circumstances from a breakdown of its currency?—No. I think that if India had had a gold standard, the currency would have become inconvertible almost at once, and it would in fact have saved a good deal of trouble and expense.

872. (*Prof. Coyajee.*) Might I submit to you one possible criticism of the idea of making the rupee limited legal tender? It might be argued that you are forcing the hands of the people and compelling them to take a gold currency. The general idea is that the people should be allowed to use gold or silver at their will, but as with, such an option the people would go on using rupees, the idea was adopted of making the rupee limited legal tender. Could that criticism be made?—I do not think it is a very serious criticism. I think we are constantly forcing people at all times. The ideal is to give them the currency they want, but the instance I have given from the jute crop shows that we do not; we give them what is most convenient, and it usually works.

873. (*Sir Alexander Murray.*) Regarding the financing of the jute crop, might I remind you that at the time you speak of the price of jute was comparatively low, Rs. 5, Rs. 6 or Rs. 7 per maund; and it is the case that at that time the rupee was a more suitable currency for financing crops. The ten-rupee note was not suitable. I remember when the one-rupee note was introduced it was said the one-rupee note would not be suitable. The one-rupee note was accepted very freely in Bengal. Is it the case that the very use of the one-rupee note led up to the greater acceptability of the ten-rupee note? Coming to this further fact the price of jute has doubled since then—instead of being Rs. 6 or Rs. 7, it has gone up to Rs. 14, Rs. 15, and even Rs. 25 a maund, it is only natural that people should be willing to take Rs. 10 notes where formerly they took one-rupee notes?—I quite agree: the higher value of jute would give a stimulus to the use of the ten-rupee note. Sir Henry Howard's comment was that the cultivators disliked taking them. That was in 1913. But obviously a much more highly priced crop would give opportunities for the use of these notes that a lower priced crop would not. Also I agree that the one-rupee note becoming acclimatised led to higher notes being taken later on.

874. (*Chairman.*) One further question before we come to the exchange standard. May I refer you to paragraph 7 of Mr. Denning's memorandum on the transfer of management to the Imperial Bank. The opening words of that paragraph are:—"A gold coin in circulation is not a necessary feature of a gold exchange standard." Do you find yourself in agreement with that?—Yes.

875. It continues—"but it is assumed that the recommendations of the Babington-Smith Currency Committee that a gold coin should be put into circulation will be accepted." That leaves me in some doubt as to why the assumption is made. I do not know if you are in a position to cast any light on that?—I think it is a case of somewhat loose wording. I do not think it is an expression of opinion by any of the members who collaborated in the memorandum. In fact, I do not know what Mr. Denning's opinion on that point is. We merely reproduced this as being the recommendation of the last Committee. We did not analyse it on its merits. Personally, unless it is a step to something further, I do not think that gold coinage is in any way essential.

876. Do I gather from that that, assuming an exchange standard is looked upon not as a transition but as the final stage, you yourself see no advantage in promoting the circulation of gold as currency?—No, Sir, I see none.

877. Following that up, are you prepared, on the basis of that opinion, actually to terminate the present provisions as regards the position of gold as legal tender?—I would not do that.

878. Will you tell us the reason for that distinction?—The position is, if people desire to use gold they may, and they have the opportunity, under the gold exchange standard of importing gold. But I do not myself see the necessity for Government, in addition to that, to go to a certain amount of expense and trouble in coining gold. Gold is under that system, available if the people actually require it.

879. Then you would preserve the privilege of gold as legal tender in circulation at the rate selected as part of the automatic protection of the rate of exchange?—Yes, I would revert to the pre-war arrangement as regards gold.

880. But you would not recommend, on a purely exchange standard, the adoption of any measures for the actual promotion of gold in circulation?—No.

881. Now I pass from that to the gold standard on the basis of what you have told us about the rupee as legal tender, and I would like to ask you first of all about the cost of that standard. I think it would be useful at this stage of the evidence if you would be so kind as to give the Commission a clearer account of precisely where, when, and how the cost of the adoption of a gold standard would arise. What would be the objects of the expenditure which involve the cost of the introduction of a gold standard?—The cost depends first upon the quantity of rupees which we must assume will have to be redeemed in gold. Secondly, you have got to sell the silver at a rate which also has got to be assumed. You have got to redeem a certain number of rupees and the first element to be decided in determining the cost is the quantity which you have to redeem. The second element is the price you are going to get for the silver and this depended upon the price to which silver may be driven down by your operations.

882. The cost of the scheme is thus the cost of replacing by gold whatever silver is tendered, less whatever is realised upon the bullion value of the silver which is received?—Yes.

883. Are there any other items of expenditure?—In providing the gold you will utilise such sterling resources as you have and a certain portion of those will be required to keep your reserve at the point at which you wish to fix it; any deficit remaining over will for the time being have to be borrowed. You will have to borrow in order to obtain the gold.

884. The cost of whatever borrowing has to be carried out in order to obtain the gold?—Yes, on which you will naturally have to pay interest. Those are the main elements. There is a capital charge which can be treated as such and there remains a recurring charge rather higher during the transition period, and rather lower in permanency.

885. Is there any other item of expenditure?—I think that is all.

886. Those are all contained in the analysis?—Yes.

887. Having obtained your opinion from the point of view of the nature of the expenditure, let us take now the actual figures. We have in the memoranda before us two accounts of what the cost might be.

The first is in Mr. Denning's memorandum, in which he arrives at a cost, for the installation of the system, of 4 crores a year for the first ten years and about 3½ crores thereafter. I am referring at the moment to the Memorandum on the Indian Currency System?*—If I may point out, Mr. Denning's memorandum has been corrected in two respects by Sir Basil Blackett.

888. Mr. Denning's proposal, as corrected afterwards by Sir Basil Blackett, is 4 crores for the first ten years and 3¾ crores thereafter?*—Yes.

889. Then Sir Basil Blackett suggests various corrections of estimates and various devices, such as the silver import duty, whereby the cost might be reduced, and he arrives at the final estimate that, with an import duty on silver, the change can be effected without the addition to the public debt of India of a charge on the general revenues during the transition exceeding one crore. I would like to ask your opinion as to what arithmetically the cost of the introduction of a gold standard system would be likely to be?—It is extraordinarily difficult, I think, to arrive at any figures which can be conclusively established. We are of course dealing with maxima. May I consider first the figure of 200 crores of silver which we anticipate would be the maximum that could be returned to us which would have to be redeemed in gold?

890. First of all, take the question as to the basis of the estimate of the amount of silver which would require to be redeemed?—The acceptance of that figure, I think, depends on accepting a maximum figure for rupees outstanding of something in the neighbourhood of 350 crores, because we have assumed that the amount of rupees which would remain in circulation when the rupee is limited tender is 150 crores or thereabouts. That figure seems a fairly safe one. But the figure of 200 as a maximum depends on the total amount of rupees outstanding being not greater than 350 crores.

891. I think it would be best if we went by steps from the beginning. What estimate can be formed as to the amount of rupees outstanding, and on what basis are you able to frame that estimate?—The only method which has been continuously employed in calculating the amount of rupees in circulation with the public is the method which was originally devised by Mr. Harrison and Mr. Adie, who were officers of the Finance Department, the second being a Senior Wrangler, and elaborated—with certain additional checks—by Mr. Findlay Shirras when he was Director of Statistics. This is called the rupee census method, which is very fully described at page 162 and in Appendix II of Mr. Shirras' book, "Indian Finance and Banking". The basis of the method is that every year in the first week of May a certain number of rupees, Rs. 10,000, is taken at random and examined in every treasury in India and in each of the currency offices. There are some 320 treasuries in India and seven currency offices; so that we get every year a total roughly of one-third of a crore of rupees examined, sorted according to the years of issue, and then the percentages of the different years of issue making up the total computed. The figures are published in the Report of the Controller of Currency every year. It is on those figures and making certain very broad assumptions, one of which is that the amount of rupees outstanding of each issue bears some sort of relation to the proportions shown by this examination, that this rupee census method with the various checks described by Mr. Shirras has been elaborated. These figures are kept up to date. I have the latest figure for 1924 which gives 234 crores as being held by the public, *i.e.*, rupees outstanding with the public apart from that held in our reserves. You have to add about 90 crores (including silver awaiting coinage) which we hold in the reserve. That gives us 324 crores as the supposed figure for rupees outstanding, including the silver held by Government. This system has often been criticized, but so far as it goes it does, I think, throw some light on the problem. I have tried to approach the same problem in another way to see whether any subsidiary check can be applied. I have taken the total coinage since the year 1835, when rupees were first coined—647½ crores. This includes 8½ crores coined for Indian States, but as these are current in British India, we must take 647½ crores. Since that time, we have withdrawn the rupees of the 1835, 1840 and 1911 issues; when rupees of those issues come back to our treasuries, they are not re-issued; they are withdrawn and sent down to the mints where they are recoined. The original amounts of those three issues were, of the 1835 rupees, 16 crores 40 lakhs, of the 1840 rupees, 107 crores 83 lakhs, and of the 1911 rupees, 94 lakhs. This last was a small issue which was withdrawn owing to a defect in design. Altogether there were 125 crores of those rupees issued. The orders for withdrawal were given, I think, in about 1900 for the 1835 rupees and about four years later for the 1840 rupees, and since that time the amount of those three issues withdrawn has been 49 crores 86 lakhs. A large quantity of these issues must be assumed to have disappeared before the year 1900, since our latest returns for the last five years show than on an average only Rs. 2,60,000 of the 1835 issue are now coming back, Rs. 29,13,000 of the 1840 rupees and only Rs. 9,000 of the 1911 rupees. You practically never see any rupees of these issues in circulation except by the merest accident and there is not likely to be a very large quantity of them retained in hoards. I think we may assume that the great majority of those issues have disappeared. If we allow even five crores to be still outstanding, we can deduct a figure of 120 crores from the total coinage. Again, the total amount of recoinages from 1835 has been about 90 crores from which we should deduct about 50 crores, representing the recoinage of the 1835, 1840 and 1911 rupees and allow, say, 5 crores for recoinage of half rupees included in my figure of 90 crores. We thus get another permissible deduction of 35 crores. Deducting 155 from 647½ we get 492½ crores as the maximum possible outstanding without allowing for any melting down or loss of any of the other issues since 1862. I think it may be argued from this that a figure anywhere in the neighbourhood of 400 crores would be too high, since 92½ crores seems much too low for the amount lost by melting and disappearance of the other issues. This provides some sort of confirmation of the figure given by the rupee census method and would, I think, justify us in taking 350 as the maximum amount outstanding rather than 400.

892. This is a matter of primary importance. Might we ask for a memorandum from your Department giving the result of these methods of estimation, on the one hand the census and on the other your own confirmatory calculation which you have just given to us?—Certainly. I have all the figures here, if you would like to have them now.

893. I think they would be more valuable if we might have them in the form of a memorandum. Such a memorandum would consist of the best estimate, based first of all on the census and secondly on your own calculations, that can be given as to the amount of rupees outstanding, if possible discriminating between rupees in hoards and rupees in active circulation?—That, I am afraid, I see no method of getting.

894. There is no basis for a scientific estimate of that?—No.

895. Nevertheless it is a matter which is of course very relevant and on which you possibly have formed some rough opinion in order to arrive at your maximum for the introduction of the gold standard?—We have to do it backwards by estimating the total amount outstanding and assuming the amount required for circulation.

896. Your estimate is a maximum of 350 crores, of which some 150 are in active circulation?—Yes.

897. One hundred and fifty crores would remain in active circulation, leaving some 200 in the hoard

* NOTE.—*These figures referred to certain drafts of the memoranda.*

category, which it is very difficult to define. Having arrived at that figure as the basis, may we refer to the cost of the introduction of the gold standard? In your own opinion, the principal thing to consider in this connection is that we have one estimate of the 200 crores of rupees to be redeemed, and Sir Basil Blackett's suggestion that that might be reduced to 150 crores. I would like to ascertain your views as to which of those two figures it is safer to adopt? —If I had to take a maximum, I should take the figure I have just given. It is, of course, a maximum, and the lower figure may be nearer the trnth than mine. I should, however, prefer, so as to be absolutely safe, to adhere to my figure, that is, the figure of 200. I think it is safe from both points of view, both to the amount outstanding and the amount required for circulation.

898. That is a difference of 25 crores in the capital cost of the introduction of the scheme, according to Sir Basil Blackett's calculations, as expressed in paragraph 21 of his memorandum. In the second place, the margin between the two estimates of cost that have been suggested to us is covered by an amount in respect of an import duty on silver. What is your opinion as to (*a*) the policy, and (*b*) the consequences of the adoption of that measure?— I think it would be justified if the policy accepted is that we should work towards a gold standard. Then, and only then, would it be desirable to introduce anything in the nature of a duty on silver which was deliberately abandoned as the result of the recommendations of the last Committee. But in those circumstances, and provided that the end was sufficiently desirable, I think that it would be justified. I think it would be unpopular in some quarters.

899. What would be the reactions, social and political, upon the populace of the introduction of such a measure?—It would confer some benefit, assuming you are going in for a gold standard, by giving some support to the value of the silver retained in this country. I think it would really be some benefit to the people of the country who are the possessors of silver. I think it would certainly be upsetting to those who are engaged in the silvor trade.

900. Any popularity, therefore, will be with the sellers and not with the buyers?—I think so.

901. Finally, the third factor, which accounts for the margin of difference between the two estimates of cost, is that Sir Basil Blackett allows for a reconsideration of the proportions proposed to be adopted for the new currency reserve. Will you give us your opinion as to which of the two schemes proposed would be the safer arrangement to adopt in respect of tho reserve?—The one in Mr. Denning's memorandum is the one to which I personally gave my adherence. The amount of gold provided in that scheme is not, so far as I am aware, greater than is considered necessary by most countries, but I am open to correction. The figures in Sir Basil Blackett's memorandum seem to be rather low in regard to provision of gold.

902. You consider that, as regards the actual provision of gold, the larger figure referred to in Mr. Denning's memorandum is, on the whole, the safer? —Yes.

903. So that I receive the impression (you will correct me if it is an inaccurate impression) that you are, on the whole, of the opinion that the safer course would be to anticipate that the expenditure would approximate to the higher figure than to the lower figure?—What we have attempted to do in this memorandum is to take an absolutely safe maximum, and on that basis if you want an absolutely safe maximum I should prefer to retain the figures in the first memorandum. I think all the figures in this memorandum are possibly a shade too high, but there is one figure which is very uncertain, the figure of 24d. as the price which will be obtained for the silver.

904. Will you explain to us in a little more detail why you feel some doubt as to the estimate of the price to be received for the silver?—It is more or less guess-work; I have very little inside knowledge of the possible reactions on the silver market, but I think it is fairly evident that whatever we may do, we shall not succeed in reducing very much the amount of new silver produced. It is not possible temporarily to throw out of action a large amount of the world's sources of supply. In the very full report before the last Committee by Professors Cuthbertson and Cullis it was made clear that only 20 per cent. of the world's silver mines are pure silver mines, and in 60 per cent. the main products are base metals, silver being merely a by-product, so that any action we can take cannot to any great extent bring about a contraction of the annual supply. Therefore, I should expect a very heavy fall in the price of silver immediately on the commencement of these operations. The only parallel which I can think of on anything like this scale was the sale of silver by Germany after 1872. Germany threw on the market in the course of six years a supply of silver equal to one and one-half times the world's production at that time, and there was an actual fall in the price of silver from 59 5/16d. to 50d.; but there were other factors then making for weakness of the silver market, such as the cessation of silver coinage by the countries of the Latin Union and Holland, and a shortage in the demand from India, so that one would have expected a fall in any case. It follows that the operations of Germany did have a comparatively small and a temporary effect. The operations here would be larger, they are twice as large relatively to the world's production as in the case of Germany. That is the only parallel I know of operations on this scale, but even allowing for the comparatively small effect of the German operations, I myself feel very nervous regarding the price that we should be able to get for our silver if anything like our maximum figure had to be sold.

905. Have you taken into consideration, in forming that opinion, the possibility that there might be a substantial selling of silver, upon the announcement of any such policy, on private account from the melting down of ornaments, and so forth, in India? —The fall in the price of silver would presumably stimulate the buying of silver out here.

906. That is just the point upon which I want to be quite clear in my mind. It has been suggested that silver is looked upon in the form of a bangle as much as a store of value as of an ornament, and that, if the value of that store is threatened with depreciation, there may be a movement on the part of tho holders of bangles to sell out in order to get into some safer store of value?—I am not certain what the effect would be on the holders. Bangles and ornaments are very largely regarded as a store to be drawn upon in times of necessity. If one visits the bullion market, one can see silver ornaments being brought in to be turned into cash in bad seasons. They are regularly drawn upon as a store of value in hard times, but whether the holders of these would get alarmed at the fall in the price of silver, I doubt very much.

907. That is really a question of the rapidity of apprehension on the part of the uninstructed public as to the future movements in the value of their silver ornaments?—Yes.

908. Finally, if we may assume for the purposes of the next question that the cost will be somewhere in the nature of the higher figure referred to, will you tell us in broad outline what would be the reaction upon the Government's finances of the incurring of such a cost?—The position as regards the Budget is, as I was saying this morning, that it is adjusted on a basis of 1s. 6d., and I was quite rightly corrected by Sir Reginald Mant when he said that we have only adjusted it without allowing for the obligations which have been entered into definitely so to shape our financial policy as to reduce the 733 lakhs of provincial contributions still outstanding and also to get rid as early as possible of the cotton excise duty of anything from 1½ to 2 crores. It is, of course, a matter for Government

and the Legislature to decide whether they would be prepared to find the money in some other way. I myself think that any figure of the kind contemplated in this memorandum is very difficult to contemplate until these obligations have been wiped out.

909. (*Sir Henry Strakosch.*) At what figure would you put the loss resulting from the sale of these 200 crores of rupees, taking your own estimate of the future of silver?—I am afraid I have framed no figure. The factors are too uncertain, but 24d. is, to my mind, rather high.

910. (*Chairman.*) If there are any supplementary questions upon the details of the last passage of the examination, we might take them now.

911. (*Professor Coyajee.*) May I be permitted to draw attention to some other factors affecting the cost of the introduction of the gold standard. In the first place, there would be a fall in the price of silver ornaments throughout the country. I mean, there are two kinds of hoards, the rupee hoards that will come out at once and claim compensation, but as regards the ornament hoards, their value will fall and they will have no compensation whatever. Is not that an additional element of cost to the country?—That is one of the reasons why I advocated in these circumstances the re-imposing of the duty on silver, because I did realise there would be a loss to the holders of silver ornaments, and to some extent you can reduce that.

912. But, of course, there is no compensatory element here. I submit there would be a rise in the price of the contents of gold hoards so far as anybody holding gold is concerned, and it may be supposed that the price of gold may be supposed to rise to a certain extent, and there would be some compensation to the holders of gold hoards. Don't you think so?—If the price of gold is going to rise, that is one of the difficulties, because of its effect on prices. At the same time private holders would gain something because of the rise in the value of their hoards.

913. Do you think an import duty on silver will be attractive to any considerable extent, because if the price of silver goes down people will be alarmed so that people would import or buy silver to a very slight extent, and there would be nothing much productive financially in any way from the duty?—We did not contemplate getting any money directly from the duty, but through the improvement in the price of silver which we would sell in India. There was no question of the import duty bringing in revenue.

914. (*Professor Coyajee.*) Because the price would fall back by a large amount owing to the sensitive silver market. In one year, as you have yourself seen, the price went down to 32d., so that the loss would be very appreciable.

915. (*Sir Purshotamdas Thakurdas.*) I understand you have about 90 crores of rupees and bullion, and that it is not likely that the Government of India will enter the silver market for purchases at least for the next year or two years?—There is no likelihood in the next year or two.

916. That fact already has had a certain amount of effect on the silver markets of the world?—I suppose it has.

917. Of course, the situation will be accentuated by any such announcement that the Government of India will not ever be buyers of silver and may be sellers of silver, and to this extent the fact that we hold more silver than we need for the next two or three years has a certain depressing effect on the market?—I suppose it has.

918. And if the bullion price of silver comes down the value of the silver ornaments in the hoards will depreciate and the Government of India cannot help it?—Yes.

919. But perhaps the most serious effect of all may be that if the bullion prices go down further, the very confidence of the people in the rupee may be shaken; have you considered this at all?—I had not really taken as a factor in the silver question the Government of India's recent abstention from coinage; they have not coined silver for some time, and as far as one can see there is no immediate likelihood of it. The silver market is a fairly wide one; but I have really no knowledge of how far the Government of India's recent position may have temporarily depressed the price.

920. The silver market has gone down to 31d. I am told?—Yes; it varied from 33d. a short time ago to about 31d. now.

921. I wonder if at 31d. what the actual value of the bullion in the rupee can be said to be?—It is given in an Appendix to the Babington-Smith Committee's Report,—Sir Lionel Abrahams' evidence gives the table.

922. Roughly the popular idea is that the rupee is worth less than 10 annas to-day?—I could find the figure for you.

923. I do not think I need an accurate figure: Sir Norcot Warren also confirms me in my supposition that it is worth about 10 annas, which means that there is already a depreciation of 40 per cent. in the value of the rupee. If there is likely to be any further depreciation in the silver market then the confidence of the Indian public will be shaken very rudely in the rupee, and to that extent is it not preferable to give them something which is more solid and something which would really have their abiding confidence rather than continue this token coin? As you said, it will be for the Government and the Assembly to decide regarding the extra cost; but does not this other question weigh equally from the point of view of keeping the people's confidence in the currency of the country?—I was naturally discussing the question of cost so far. I have not been asked definitely as to the advantages or disadvantages of adopting a gold standard.

924. (*Chairman.*) Probably Mr. McWatters would prefer to answer that at large.

925. (*Sir Reginald Mant.*) Do you estimate that you will be able to sell the whole of this silver in India?—I doubt if you could sell all of it in India.

926. But your estimate of reducing the cost by a four-anna duty on silver assumes that you will be able to dispose the whole of it in India?—It practically does, that particular estimate, yes.

927. If you cannot sell it all in India?—The silver duty will naturally help you so far as your sales are completed in India; the Indian demand is very hard to estimate; but over a period of ten years I should hesitate to say; but I should rather doubt if it would be as much as 200 crores.

928. Then you would either have to take a longer time to dispose of your silver or you would get a smaller price for it?—That is so.

929. (*Chairman.*) Before I ask you a final question, there are one or two matters I want to refer to. I understand you will be able to give us some statistics of the absorption and return of rupees from circulation during the busy season?—Yes; I understand those figures came in in the course of discussion when Sir Basil Blackett was heing examined.

930. That is so?—I have taken the period from the year 1912-13 to the year 1924-25, giving the absorption of rupees in the busy season, the return when there was one in the slack season, and the net result for each of those years in the form of a statement.

931. Do those give us monthly figures?—No, the statement distinguishes the two portions of each year; the busy season in some years begins earlier than in others; I simply call it the busy season; it is usually from November to March or April.

932. What are these figures?—They are crores and lakhs of rupees.

933. What are they,—currency outstanding?—Rupees withdrawn from the paper currency reserve and coming back into the reserve.

934. That is, figures of rupees withdrawn from the paper currency reserve and the rupees returned into the paper currency reserve, withdrawn in each busy season and returned in each slack season?—Yes.

935. (*Sir Henry Strakosch.*) Are they divided between notes and rupee coin?—The figures show rupees only.

936. (*Sir Henry Strakosch.*) It would be interesting to have figures of notes coming in.

937. (*Chairman.*) The figures of the total circulation are not given. Are those not given in the Appendix to the Report of the Controller of Currency?—Yes; I do not know if they are in the exact form to which Sir Henry refers.

938. Will you consider that and let us have the figures which Sir Henry suggests, either by reference to some readily available source or by addition to this table?—Yes. The reason that I prepared the statement in this form is that the currency reports do not distinguish between the busy season and slack season; I thought that what was required was the maximum amount of rupees that would be liable to go out during the busy season. It shows that in the year 1913-14 there was a total fluctuation of 26 crores and a total withdrawal on balance of 6 crores.

939. I will give you this back, and, if possible, you will supplement it in the manner Sir Henry has described. The second head of information which I trusted we might obtain from you was some statistics as to the amount of the demand on the sterling reserves in a period of exchange weakness?—Yes. I have prepared a statement. The first period of which I have given information is the crisis of 1907-1908. I have given details here showing the total demand to have been about £18 millions. For the later periods the information is given most conveniently in statement No. 3 in the Controller of Currency's report for 1923-24 and earlier years. The statement does not occur in the report for this year; so that you will have to go back to the year before; it has been omitted in this year's report because it was thought that it was not appropriate in the Controller of Currency's reports. But this statement gives the whole of the details of the cash transactions of the Secretary of State and from that everything that is required to estimate the demand on the sterling reserves could quite easily be picked out. It gives the sterling balances, war transactions, movements in the gold standard reserve, and everything needed in the form of a balance sheet and I think that statement would give any one who wishes to go into the matter further, absolutely all the information that is required.

940. It can be quite easily picked out by one who is not familiar with accounts?—I think so. I have picked it out for the three years in which reverse councils were actually sold, and the other years could be worked out in the same way.

941. A mere glance at this table suggests to me to ask whether some official of your department would be so kind as to analyse that information for us?—I think Mr. Aiyar can do it. It is actually his own report as Controller.

942. Just before I ask you the general question to which I referred just now, in order to make sure that our minds have the same considerations in view, the amount of gold required to put the gold standard system into force is estimated in the memorandum, if I remember aright, at 103 millions sterling?—Yes.

943. The requirement being spread over a period which may be estimated in various ways?—Yes.

944. The exact period during which the gold will be required being subject to many hypotheses?—Yes.

945. Have you taken into consideration, in forming your conclusions upon this matter, the effect of this demand upon the general level of gold prices?—Yes. I would propose to deal with that in my general observations on my attitude towards the scheme as a whole.

946. I only wanted to be sure that all major considerations would be dealt with in your reply. Then let me ask you: in view of the estimates of cost into which we have entered; in view of the effect upon the budgetary situation of the Government of India; and in view of the general considerations as to the effect on prices to which we have referred, what, in your opinion, are the comparative advantages of a gold standard, the comparison being either with the gold exchange standard or the sterling exchange standard?—I agree with the view taken in the memorandum that the gold standard system would remove, so far as is possible and more completely than either of the other systems, the defects that remain in the Indian currency system; and in particular that it would help to cure the first defect mentioned, viz., the danger to the system from a rise in silver prices. But the main value of the gold standard system must be joined on wider considerations. It is impossible to measure the benefit in money and it must be a matter of opinion how far the introduction of such a system would in practice work towards the ideal system, that is to say, how far you will really be able to get through the stage of gold currency to the stage of doing without it. If you could do so, I think that the gold standard system would be both progressive and educative and more suitable far more than any other. I think the main problem in India to-day is the development of the latent sources of wealth of the country. We meet this problem at every turn: the question of raising rupee loans in India; the question of obtaining money from Indian sources for all the great requirements of the country. If the introduction of a gold standard did have the result, as some of us believe, of weaning people from their present habit of storing precious metals, it would be worth paying a good deal for it. That it might do so, I think, follows or should follow from the fact of human nature that when people can be certain of getting something readily, they are less likely to store it; when the currency of the country is convertible into gold, they will be less likely to wish to keep a store of gold. It is really in expectation that something of that sort might happen that one desires to take rather a wide view of the possibilities of the gold standard. As I said, it cannot be measured in money; but I do believe that its introduction would be to the advantage of India, if it could be effected without corresponding or greater disadvantages—; and to that point I shall turn now. As regards the cost I have already expressed my opinion that anything like the figures given in this memorandum* seem to me too heavy a cost for us to face, at the present time at any rate. In the second place there are two dangers on neither of which I am in a position to give a definite opinion; first, the effect of such operations on the price of gold, with a consequent reaction on India herself through a fall in prices and the disturbance of the currencies of other countries; and secondly, the extremely disturbing effect upon the silver market. I think these are both dangers inherent in this scheme; and I am not in a position to form an opinion on their gravity; but the difficulties do appear to me to be formidable; and if the result of going on to the gold standard were to involve India in dangers greater than the benefits which I believe the scheme would bring, it would obviously be a dangerous proposition.

947. (*Sir Henry Strakosch.*) Do you think that the introduction of gold currency in India would have any effect on the volume of the note circulation? Do you think that the gold coinage circulation will not replace notes which at present are in circulation?—I think that to some extent the gold currency must replace notes; but with the establishment of a gold standard I should expect that there would be ample room for the expansion of the note issue as well as for a certain amount of gold in circulation; I do not think in the long run it would hurt the note circulation.

* NOTE.—This refers to the figures in the earlier draft of the memorandum.

948. Another question is this: would you regard the gold in circulation in the pockets of the people as of any great value to meet any pressure on the exchange? Do you think that in times of stress gold would come in about the same proportion as notes? —I think that it might be of some use as a reserve, though not nearly as useful as gold held by Government.

949. You would not think that, under really serious pressure, the tendency would rather be for notes to come in that gold?—The tendency would certainly be that.

950. So that one might say, if one were cautious that the gold in circulation would hardly be available or could not be relied upon as a reserve to maintain exchange?—That is, that gold in circulation is an ineffective reserve to rely upon? I agree.

951. And that therefore a reserve to maintain the external value of the rupee even under a gold standard would have to be practically as substantial as the reserve under any other system?—Yes, I agree.

952. (*Prof. Coyajee.*) It has been suggested that one effect of the introduction of a gold currency would be to weaken the hold of the Imperial Bank on the local money market, because the Indian money market will be swayed by the discount rate in London? —I am afraid I have not considered that.

953. (*Prof. Coyajee*): Because gold currency might be wanted in England and so it is the rate there which will sway the money market rather than the rate of the Imperial Bank.

954. (*Sir Norcot Warren.*) I do not quite understand that.

955. (*Prof. Coyajee.*) The hold of the Imperial Bank upon the local money market will be weakened by the introduction of a gold currency because with gold currency prevalent here gold will be coming out as required from London, and its coming out and going back will depend more upon the rates prevalent in London than on your rate.

956. (*Chairman.*) Have you any view on that?—I have not considered that.

957. (*Sir Purshotamdas Thakurdas.*) If I may repeat the question I put before. Should there be any further depreciation in the price of silver bullion, as is anticipated by some; do you think that the confidence of the people of India in the rupee would be badly shaken or not?—I should doubt whether the confidence of the people of India would be much shaken; they have experienced some very extreme vicissitudes in the price of silver in the last generation from 20d. to 80d. I do not think it will really affect the position as regards the rupee.

958. You do not think therefore that any depreciation in the rupee bullion values would really matter as far as the masses' confidence in the rupees is concerned?—I do not think so; I do not think there would be any essential danger.

959. Of course there have been fluctuations in the silver bullion value, but it was about 25 years back? —I was referring particularly to the prices, during the war, when they went up to over 80d. and down to 30d. within 12 months.

960. That was an appreciation first and later on a depreciation. The depreciation did not matter very much for two reasons, because there was no other metal available and we were in the midst of a war; but when you referred to the drop to 20d., I thought that you referred to a longer period back?—I was referring to the period from about 1902 to 1910.

961. During this interval the people have been clamouring for gold currency, and you do not think that in view of the lapse of fifteen years and the general clamour for a gold currency, any depreciation in prices of silver bullion would matter?—I do not think it would make any difference to the rupee being accepted in India and being welcomed as the coin of the country; I do not think the bullion value of the rupee really is known or appreciated by the ordinary people who use the rupee.

962. It would, then, I take it, surprise you, if you found that people were really beginning to think about this and that they were really watching the fluctuation downwards, if there were any, in the silver market?—I should be surprised if the mass of the people of India were doing so.

963. For example, if there were talk in the bazaars that the rupee generally was worth only eight annas? —I was not referring to the talk in the bazaar. I was referring to the opinion of the people all over the country.

964. The masses of the people take their cue, don't they, from what is being talked about in the bazaars, say in Delhi or Ahmedabad for example, leaving aside the presidency towns? Of course we know that what is being talked about in presidency towns does not come down to the masses so quickly?—Yes; I have no doubt the towns influence the country; they always do.

965. Regarding the question of cost, if the people felt that they were having something really solid and substantial and that something which was not worth the face value of it was being replaced, do you not think that the people may reconcile themselves to reasonable additional cost for that?—The question of whether the cost should be accepted really is not for me. It may be that the people as represented by their legislature might say it is worth the cost. I was giving my own opinion.

966. I was only asking you since you have been in the legislature. I was wondering whether you were prepared to express an opinion as to how the legislature is likely to view this?—I can give no opinion on that.

967. (*Sir Henry Strakosch.*) With reference to the last question that Sir Purshotamdas Thakurdas raised, whether a fall in the price of silver might cause distrust in the rupee, and might make it less popular, what was the experience measured by the note circulation in relation to the rupee coin circulation when the price of silver dropped? We have in this country circulation side by side of a note printed on paper of no intrinsic value at all, and the rupee coin which is a note printed on silver; their circulation side by side commands exactly the same prices. When the price of silver fell, did the circulation of rupees diminish and that of notes increase or *vice versa*?—The first effect of the year 1921, when there was a heavy fall in price of silver from 80d. to 30d. was an enormous return of rupees from circulation.

968. And notes were demanded?—Yes.

969. Which notes are convertible into rupees?—Yes; the two years following the fall in the price of silver resulted in the currency being choked with rupees.

970. What inferences would you draw from that? —At the time I did not draw any inferences except that it was an obvious proof of the slackness of trade, which is always shown by rupees returning.

971. It did not indicate to you that there was less trust in the rupee?—I drew no such inferences at the time.

972. (*Sir Purshotamdas Thakurdas.*) Just arising out of that question: the people realise that the note is only a promise to pay rupees and therefore if they had mistrust in rupees they would not rush for notes, is not that so?—I do not think there was any mistrust.

973. Even if there was a mistrust in the rupee they would not come for notes; they would come for bullion at whatever price they could give for their hoards; notes are simply a promise to pay rupees: it is not that the notes are backed by gold or anything but a promise to pay rupees?—Yes.

974. (*Sir Reginald Mant.*) I gather from your reply to the Chairman that you consider it to be too dangerous a leap in the dark to attempt to introduce a gold standard now. Do you think that the cost and the risk will be materially reduced by waiting a few years in view of the very large imports of gold that

have taken place in recent years, especially last year, when about 73 crores, I think, of gold coin and bullion was imported in 1924-25?—I think that both the cost and the risk would be reduced after a measurable period. The cost would be, because so long as we do not coin any more silver the amount of silver help in the reserve is bound to go down. It should go down at the rate of about nine crores a year. And therefore you could soon count upon a drop of 30 or 40 crores in the amount of silver that you will eventually have to redeem. You will certainly be able to reduce the cost by waiting. And the risk—it should be less also in view of the smaller amount of silver to be redeemed, but I should still find it difficult to estimate the risk arising either from the gold problem or the silver problem.

975. But India is absorbing gold now at a very rapid rate?—She did last year at a very rapid rate; this year to a smaller extent.

976. And that gold—the greater part of it—is presumably replacing rupees in hoards?—Yes there is almost direct evidence of that from our returns of absorption last year.

977. Well, if the absorption goes on at that rate, presumably all the hoards will eventually be converted into gold by natural processes, without any stimulation from Government?—I agree that the problem should be made very much easier by waiting. The process by which it will be made easier is going on.

978. It may in fact come about by natural causes, without any heroic measures?—That I am not prepared to say.

979. I was only asking whether it is a possibility?—It will take some time, I think, unless it is given a stimulus of some kind.

980. (*Sir Henry Strakosch.*) May I ask another question? Mr. McWatters, you mentioned just now that silver hoards have apparently been replaced by gold hoards. But what has happened to the silver? I see no record of any silver exports from this country except in years of really extreme prices?—We assume that the silver that has come out has been used as currency, because our currency returns do not show that amount of silver being issued which we should expect. In view of the fact particularly that the one-rupee note has been abolished, it is most extraordinary that the amount of silver that has been absorbed during the year is so small as it is, and the only way we can account for it is that a large number of rupees have been replaced by gold and are being used as currency in the country.

981. And the fact that your accumulation of rupees has not gone down might be accounted for by that fact?—That actually has been given by the Controller of the Currency as the reason in his opinion.

982. (*Chairman.*) The replacement of silver in hoards by gold is, therefore, indirectly inimical to the finances of the Government in so far as it delays the absorption of the Government's unnecessary stock of rupees?—I had not thought of it in that way. But it is so. We have a redundancy of rupees which, strictly speaking, on the ground of economy we ought not to hoard. They are uneconomical.

983. This is the last question with which I will trouble you. I think perhaps you may be able to give us some useful assistance with regard to the terms of transfer to the Imperial Bank. Suppose there is a transfer of the note issue. We have already discussed it in some detail to-day, so that there is no necessity for you to do so. Three alternative methods are proposed in the memorandum of Mr. Denning, by which the Imperial Bank might make a payment in respect of the privilege of monopoly of note issue. Can you express an opinion as regards the comparative merits and advantages of these three methods which are set out in paragraph 18 of Mr. Denning's memorandum?—The first alternative is that Government might take a share in the profits of the bank. My personal opinion is against that alternative. I think that it is somewhat undesirable for the Government to be in any way dependent, so to speak, upon the actual earnings of the bank or to be so closely associated with them. I think it would interfere not only with the Government's budgetting, but also with the independence of the bank. I should think the bank would also find it extremely inconvenient for the Government to be a part sharer. On the whole, I dislike that alternative.

984. The second alternative, to keep a profit and loss account, is practicable?—From the separate memorandum which Mr. Denning has submitted I think it will be realised that it involves a fairly complicated statement of accounts. The appendix to the memorandum on the profit obtained by the Government on the note issue shows the various items which go to make up the debit and the credit side of this account. On the whole I think it quite a possible system, provided that one can arrive at the proportion of certain costs to be debited. There are items, for instance, such as the loan of currency buildings—I think you could arrive at a balance-sheet. It is a little complicated and it is extraordinarily fluctuating. These are the two possible objections to it. It is fluctuating largely because of the difference in the amount of the sterling securities held and because the whole of the interest on the loans of seasonal currency may be credited in the next financial year, as happened last year. On the other hand, the expenditure has gone down owing to the abolition of the one-rupee note. But I think that alternative is possible.

985. With regard to No. 2, do you consider it possible that the Government might desire to keep some control over the overhead charges of the note issue department from the point of view of ascertaining their proportion of the profits?—I agree that would be a difficulty. And also they would have to institute a very elaborate audit and examination of the books. But in any case the books would have to be audited very carefully. On the whole I prefer the third scheme of a percentage on the invested portion of the reserve, if a workable scheme can be devised. If it is revisable after an interval, say, of five years, I think a tentative scheme of that kind would probably be the best of the three alternatives.

986. What specially commends No. 3 to you?—Its simplicity and rather the avoidance of the difficulties of the other two than any special merits of its own. I think it bears some relation to the actual facts.

987. There is also the advantage, if it be an advantage, that it has not uncommonly been adopted and has been found to work well elsewhere?—It corresponds, I think, to the German Reichbank system.

988. (*Sir Henry Strakosch.*) May I ask if the second system would not involve the separation of the banking department from the issue department?—I think it would. And that is, in fact, recommended in the memorandum.

989. (*Chairman.*) Are there any further supplementary questions on the question of the terms of transfer? Apparently no members of the Commission have any questions to ask. I do not know if there is any topic to which you think you might with advantage refer to supplement the questions which we have asked you?—No, Sir, thank you; I have nothing more to say.

990. (*Chairman.*) The Commission is very much obliged to you indeed for your assistance to-day.

(*The witness withdrew.*)

FOURTH DAY.

Friday, November 27th, 1925.

PRESENT:

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Henry Strakosch, K.B.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.

Mr. A. V. V. Aiyar, C.I.E.
Mr. G. H. Baxter (*Secretaries*).

Mr. H. Denning, I.C.S., Controller of the Currency, called and examined.

991. (*Chairman.*) Mr. Denning, you are the Controller of the Currency in the Government of India?—Yes.

992. Will you tell us, for the sake of our record, what your previous experience in the financial administration has been?—I joined the Finance Department originally in 1916. I was a Deputy Accountant-General for about two years. Then I became Under-Secretary in the Finance Department, in which position I stayed about six months. I then went to the India Office on deputation and was Joint Secretary of the Babington Smith Currency Committee. In April, 1920, I came out to India as Deputy Controller of the Currency, Bombay, in which position I remained, apart from intervals of special duty, up to March, 1923, when I became Controller of the Currency.

993. We understand that, on this occasion, the evidence which you will give will be given in your personal capacity and not officially on behalf of the Government of India?—That is so.

994. We have had the advantage of very full memoranda with which you have provided us, in particular, a memorandum upon the question of a gold standard for India, a memorandum upon the terms of transfer of the note issue to the Imperial Bank and a supplementary memorandum to that; and you have also, I understand, taken part in the consultations with Sir Basil Blackett and Mr. McWatters, on which the memoranda with which we have been provided were based?—That is correct, with one exception, that I took no part in the discussion on the separate memorandum put in by Sir Basil Blackett.

995. Oh, yes; that I should make clear, that Sir Basil Blackett's memorandum on the Indian Currency System is his own personal memorandum. I should like, in the first place, to ask you one or two questions suggested by the historical memorandum, and which perhaps can best be answered by the present occupant of the position of the Controller of the Currency. Let me draw your attention, first of all, to the system by which loans are made to the Imperial Bank of India from currency against hundis and ask you whether this arrangement works smoothly?—In my opinion, it does not work at all smoothly, for more than one reason. In the first place, the Imperial Bank find considerable difficulty in getting the necessary amount of genuine hundis to place in the reserve against the note issue, and both last year and the year before they had to resort to inducing firms which have hitherto financed themselves by cash credits to finance themselves by bills in the place of cash credits. These bills, although they represented a real demand for finance for trade, did not represent any definite goods or commodities. They were in effect manufactured bills substituted for cash credits. Another difficulty is the decision as to how the currency shall be expanded when necessity requires it—as to whether it shall be expanded by issuing notes against treasury bills put into the reserve in London or by issuing notes against hundis in India. The bank during the last two years, mainly because it certainly does not gain anything and may lose something by taking these loans, has always been pressing Government to increase the currency against treasury bills in London. On the other hand, Government, in order that it may keep its resources in London more liquid, does not wish to tie up its resources by placing treasury bills in the paper currency reserve to a greater extent than it is compelled to do. Therefore, during the last two years, there have always been discussions between the Managing Governors and myself as to which of these two methods should be employed. We have always come to an agreement in the end; but it is a definite disadvantage to have two systems of expanding the currency working side by side under the control of two different authorities. The third point which I mention incidentally is the possible loss to the bank. It is very difficult to estimate this loss, and Government have in the past refused to make the bank any allowance for this loss.

996. What is the nature of the loss?—The nature of the alleged loss is this: The bank rate is at 5 per cent. we will say and the hundi rate, we will say, is at 5½ per cent. The Imperial Bank lends money on three months' bills at 5½ per cent. The Bank rate then goes up to 6 per cent and in order to keep the necessary amount of cash in hand, the bank has to borrow from the Government at 6 per cent. while it has a large amount of money outstanding on bills at a lower rate. That I think, is one of the main ways in which it is alleged that a loss occurs. Another which I was going to mention is the stamp duties on the hundis which are manufactured. The stamp duty on hundis is regulated by a graduated scale; but it works out to about Rs. 9 per Rs. 10,000. The stamp duty on a promissory note is at a fixed rate of 4 annas. So in order to induce firms to finance themselves by hundis rather than by cash credits for which they would give promissory notes, the bank paid the cost of the stamp duties on the hundis which were manufactured. Government after some discussion consented to reimburse the cost of these stamp duties to the bank.

997. (*Sir Henry Strakosch.*) May I ask what the rate is?—Roughly Rs. 9 per Rs. 10,000; but for the lower denominations of bills it is according to a graduated scale which is laid down in the Stamp Act.

998. (*Chairman.*) What you have described is apparently a machine turning with a certain amount of sand in the wheels. What is your opinion in regard to the best method for improving the working of this part of the financial machinery?—Do you mean without handing over the charge of the note issue to the Imperial Bank?

999. I mean quite at large?—Assuming that Government continue to control the note issue?

1000. No, making no assumption at all?—Well, I think the best way would be to hand over to the Imperial Bank the control of the note issue, making a provision in the statutory constitution of their reserve which would allow them to expand and contract according to the seasonal demands for the currency.

1001. To complete the picture, excluding that possibility, what method should there be for improving matters, accepting the present basis as to the control of the note issue?—I am afraid I cannot give any definite recommendations on that subject. I have tried in my capacity as Controller of the Currency to devise a better system and I am afraid I have not succeeded in devising anything that is really satisfactory.

1002. (*Sir Purshotamdas Thakurdas.*) You said, Mr. Denning, that when the Imperial Bank want that emergency currency, they have got to present to the Government what you call manufactured bills, that is, bills made out of the cash credits that they give?—Yes.

1003. You are aware that these cash credits are generally given by the Bank against liquid assets of the concerns which the borrowers are in?—Yes.

1004. So that for practical purposes, there is nothing that can be said to be wrong in looking upon the cash credits as bills?—Except that they do differ from a credit given on a trade bill. The credit given on the trade bill is self-liquidating but the cash credit goes on more or less indefinitely.

1005. The trade bill is capable of being renewed.—I agree.

1006. And in ordinary course in a busy trade centre, it would be renewed at the current rate of the day at the expiry of three months. If the man really wanted money and had the liquid assets in which he was trading, it could be renewed as long as the man's credit was good.—Probably.

1007. Does not the same thing happen in the case of these cash credits? A mill for instance holds cotton and holds manufactured articles. Cash credit is given against absolutely liquid assets.—Yes; I do not think there is much essential difference.

1008. I suppose you are also aware in your position as Governor of the Imperial Bank that these cash credits are payable on demand and can be called up any time that the bank wants to?—Theoretically, yes.

1009. Are you aware that in a few cases recently, the Imperial Bank have called up cash credits?—I have seen reports to that effect; but as far as I remember, a fair amount of notice was always given.

1010. You are not aware of any case where they have been called up suddenly? I mean, if a few cases were brought to your notice where cash credits have been called upon at a very short notice, say a week—perhaps shorter than a week—then would you say that these cash credits are in effect the same as trade bills?—Practically the same.

1011. (*Sir Henry Strakosch.*) Dealing with the question of cash credits, when you said self-liquidating bills, you no doubt had in mind bills drawn against goods in the last stages of production and on the way to market, bills which are drawn not against fixed assets which cannot be consumed or against goods which are held up possibly for speculative purposes, but for goods which go to the market and by the process of going to the market become self-liquidated?—Yes, that is really what I meant.

1012. So that if a cash credit is given against that class of goods, that cash credit could legitimately be turned into a hundi, into a self-liquidating Bill, of as good a quality as such bills should be?—Yes.

1013. All I want to say, is that a cash credit given on the security of other things such as, for instance, the installation of machinery which is not a self-liquidating affair or the speculative holding up of goods—those you would condemn?—Yes, those I should condemn.

1014. (*Sir Alexander Murray.*) How would you treat cash credits issued against stocks of raw materials bought by mills either in the shape of cotton or jute that would probably be kept up for 6, 7, 8 months against ultimate manufacture and export in the shape of manufactured articles? They do not come under either of the categories that Sir Henry Strakosch has been putting to you.—I think they do except that the period is longer.

1015. (*Sir Purshotamdas Thakurdas.*) Cash credits which are given to, say, cotton commission agents at Bombay against cotton which is for sale would come under one of the categories mentioned by Sir Henry Strakosch. Do you think that that would be included?—I think, generally speaking, that would come under the class of self-liquidating bills.

1016. And such advances of cash credits generally are very materially reduced always of course in proportion to the stock of raw cotton, for sale, in Bombay, in monsoon months?—Yes. To my answer, I would make this qualification: that if a banker saw that stocks were being unnecessarily held up, he might withdraw the amount of credit given on those stocks.

1017. I am very glad you mention that. You know that the Imperial Bank in Bombay did very severely curtail their cash credit facilities when they saw that the stock of piece-goods was going up during the last six months?—Yes.

1018. Suppose the cash credit system was discontinued in the Imperial Bank and all the mills which are at present financed by cash credit system were told that they would have to present hundis to the Imperial Bank for 60 or 80 days as the case might be, would you, as Controller of the Currency, be inclined to say that these concerns which enjoyed facility of cash credit would be or should be debarred from having their hundis accepted by the Imperial Bank?—No; I should not go so far as that, because I do not know the details of all the cash credits given by the bank sufficiently.

1019. Taking it for granted that the cash credits are given against liquidating assets and not for installation of machinery or to finance capital debts, taking that presumption to be correct, would you then as Controller of the Currency be disposed to say that their hundis should not be accepted?—Not generally speaking: unless, as I stated before, they were holding up stocks unnecessarily.

1020. I wonder if you were in India in 1923 when there was a heavy corner attempted in Bombay known as Rai Sahib Sangli Das Jessiram cotton corner.—I believe I arrived in India shortly afterwards.

1021. In September 1923?—No, I was not in Bombay, though I was in India.

1022. I wonder if you ever heard after you took charge after September 1923, on your return, that the Imperial Bank definitely refused to give a single farthing to Rai Sahib Sangli Das Jessiram?—Now that you remind me, I do remember it.

1023. Do you recollect that the Imperial Bank in Bombay definitely refused to give a single farthing for him?—I think I remember reading that in the reports from Bombay to Calcutta.

1024. (*Chairman.*) We understand that the witness has answered these questions from his general knowledge from the newspapers.

1025. (*Sir Purshotamdas Thakurdas.*) I do not think so. Mr. Denning said he read it in reports from Bombay to Calcutta. I wonder if he means newspaper reports or his assistants' official reports.—As regards that particular question about cotton corners I cannot recollect where I read it.

1026. (*Chairman.*) What is your view in regard to the advantages or disadvantages of making the amount of loans against hundis, under present conditions, a percentage of the note circulation instead

of as at present limited by the gross amount?—I think the percentage system has the advantage that you have not to increase the amount by which notes can be issued against hundis periodically as the needs of the country expand. In India, the needs of the country for currency will probably be expanding continuously and it seems likely that the needs for the seasonal currency may expand also.

1027. Supposing that it were considered a more advantageous course can you make any suggestion as to the actual percentage which it would be desirable to fix?—I have not really considered that point. But I think ten per cent. of the note issue should probably be the maximum.

1028. I was going to ask one or two questions about the purchase of sterling by the Government. That is a matter which has come rather specially within your own sphere of experience?—Yes

1029. We understand that the method of direct purchase of sterling has recently been introduced. Are you in favour of continuing this method of remittances, either in its entirety, or, secondly in partial substitution of council bill sales?—I am in favour of introducing it entirely in substitution for council bill sales. I think it is possible that one might supplement it by a tender system in India. But I think that the conduct of the government exchange operations in two different places, that is, in London and in India, must necessarily lead to a lack of co-ordination between the two controlling authorities, and therefore a lack of continuity in the policy of Government.

1030. Will you amplify a little the reference you have just made to a possible system of purchases by tender? Would that, in your opinion, be a practicable course, and, if practicable, would it be a desirable course?—I think it would be a practicable course. In fact, I see no greater difficulties in receiving tenders, say in Calcutta, than in receiving tenders in London.

1031. What would the advantages of that method be?—Well, I am not quite sure whether there would be any advantages under a stabilised exchange; but during the last two or three years, when exchange has been fluctuating, there have been occasions on which it has been an advantage to have a weekly offer of council bills—I will take as an instance from January to March this year when Government were not prepared to purchase below 1s. 6d. From January onwards exchange weakened considerably, and Government were still anxious to make remittances to London in order to strengthen their sterling resources. If we had to come in to purchase sterling at 1s. 6d., there would have been some little difficulty in knowing how far one would let exchange go up, or how far one would keep it down by purchasing sterling. There was a weekly offer of Council Bills on the market, and in some weeks the tenders at 1s. 6d. or above amounted to the full amount of the offer; in other weeks they were smaller. I do think that during that period, at any rate, Government were able to remit certain amounts at 1s. 6d. without affecting the market at all seriously, and that if we had attempted to remit by purchases of sterling, we might have introduced unnecessary fluctuations into exchange.

1032. Am I right in thinking that the conclusion at which you arrive is that the system of tender might be held as it were in reserve as a possible method, giving desirable results at times of fluctuating exchange, but not for use at ordinary times of stable exchange?—Yes. I would limit it rather more strictly than that, and I would say that the system of tenders should be limited to the times when exchange is fluctuating with a tendency to weakness and when Government are anxious to remit.

1033. Mr. McWatters told us that there has been a demand by the commercial public for the more frequent publication of statistics of purchases, etc. Do you think there is any objection to meeting that demand?—I see no objection to meeting that demand to a certain extent. One form of the demand is that we should publish each morning the amount we purchased the day before. I do not see why we should give away such details of our operations to the public. On the other hand, I see no harm in meeting the demand so far as to publish a statement of our sterling purchases weekly, possibly two or three days after the end of the week to which it refers.

1034. What would be the consequences which you anticipate from more frequent publication?—Well I can give you an example which I think will show what evil consequences might result. In the early stages of purchasing sterling I was as Controller of the Currency giving the Deputy Controller of the Currency in Bombay certain limits up to which he might purchase at each rate; that is to say, I might instruct him that he might purchase up to £250,000 at a certain rate, and when he had purchased that amount at that rate he should raise the rate and inform me. Well on one occasion a speculative Bank surmised the amount of my limit conveyed to the Deputy Controller of Currency, and came in and bought the whole of that £250,000, and the rate was raised. I would point out that I have to give the Deputy Controller of the Currency in Bombay definite authority of this sort because I cannot give him a limit and tell him to stop. He cannot purchase £250,000 at a certain rate and then leave the market hanging in the air while he wires to me for further instructions. I have to decide the amount which I am prepared to purchase in Bombay and give him that limit, and tell him what he may raise the rate as soon as that limit is reached. On this occasion, as I say, this particular Bank realised what my limit was and bought the whole amount and put the rate up. So I say that if you give exact information immediately, that is the day after you have made your purchases, you will encourage speculation.

1035. (*Sir Henry Strakosch.*) I would ask Mr. Denning whether the sale of sterling in India is not a great convenience to the commercial community in India as compared with the tender of Council Bills in London?—Yes, I think so.

1036. You think it would be conducive to improving or facilitating trade in India if sterling were purchased in India?—I think so. I think that fact is rather clearly brought out by considering that most of the tenders for Council Bills are originally sent from the offices of Exchange Banks in India to the Head Offices in London, and that the Head Offices in London merely put in those offers which originally come from India to the Bank of England.

1037. Coming to the practice of selling Council Bills in London and making purchases of sterling in India, your objection to that is, I take it, that you think it would be preferable to have one authority only intervening in the market in the same direction, in fact, to concentrate the sterling demand in one hand?—Exactly.

1038. So as not to interfere in the market, and possibly one authority in reality counteracting the efforts of the others?—Quite.

1039. You would therefore concentrate at one spot, and that spot should be India?—Yes.

1040. I did not quite follow the objection to the system of tenders in India: what is the objection to offering sterling by tender in India somewhat in the same way as Council Bills in London?—I do not think there is any great objection. But, on the whole, I think that the system of purchases of sterling such as is being worked now is easier both for Government and for the public.

1041. Would you not by inviting tenders first of all obviate speculation, and, secondly, inform the public of what amount of sterling is being demanded? Do you assume under that that there would be intermediates between the tenders?—Yes.

1041A. And intermediates would be sold at a fixed rate?—Yes. I do not think that there would be any great objection to a system of that nature.

1042. You would then satisfy the public demand for regular publication. In the light of what would happen if the Imperial Bank were to take over the note issue, and, of course, the duty of maintaining exchange, would you point out what would happen? You would then say that tenders are to be asked merely for Government remittance?—I suppose so.

1043. You mean to say that the Imperial Bank would call for tenders?—Yes.

1044. Supposing the Imperial Bank takes over the note issue and the obligation to maintain the exchange, and also the obligation to remit money to England on behalf of the Government of India?—Then they would be the authority to deal with the exchanges, and they might then offer sterling on tender on behalf of Government?—On behalf of the Government or in order to transfer funds for themselves to London, I do not think there is any great objection to the system, but, on the other hand, I do not quite see why the Imperial Bank should not be allowed to come into the market in order to supply itself with funds in London. I believe there is no other country in the world where a system of tenders of this nature holds.

1045. That is true, but there is no other country that has to make such substantial remittances on behalf of the Government as the Government of India?—Probably not so large, but there are a large number of countries who have remittances to make, and they make them by the Central Bank operating on the market in the ordinary way.

1046. And you would say that as the Imperial Bank would not only be dealers on behalf of the Government but also for private people and companies, it would hardly be right to distinguish between purchasers on behalf of one of their customers or another, the one being the Government and the other private people?—Exactly, I think they would have to arrange their exchange operations so as to satisfy all the requirements, those of Government and those of their constituents.

1047. (*Sir Alexander Murray.*) Do you recognise any difference between remittances made, such as are being made now with a view to keep down exchange and remittances made purely by the Bank or by Government in the ordinary course? Are they equally suitable for tender?—Obviously, you do not want a tender system if you are simply buying sterling at the upper gold point because your rate is fixed; if you are buying an unlimited amount at the upper gold point in order to keep exchange down, the weekly tender is no use to you at all because you simply take all that sellers bring to you.

1048. (*Sir Norcot Warren.*) Mr. Denning, you just said, talking of tenders and the way we do it now, that it is just as easy to buy sterling in Calcutta by tender as it is to sell councils by tender in London. But is it as easy to call for tenders in Calcutta, Madras, Karachi, and Bombay, that is four places?—I think it could be arranged in much the same way as the tenders for reverse councils have been arranged in the past. I admit that there is necessarily a certain amount of delay. As far as I remember, the tenders for reverse councils were received in Madras, Bombay, and Calcutta, and they had to be put in at the various Government offices by 1 o'clock. Owing to the necessity of telegraphing these tenders to one place, and having the results collated there and then re-telegraphing back to the original office of receipt, the result of the sale could not be published till the next morning, that is to say, that after putting in their tenders at 1 o'clock on one day the market were unaware how much was going to be allotted to the market as a whole, and to individuals in particular, till the next morning.

1049. Does not that create a great deal of uncertainty?—I think it does. But I would say that it creates no more uncertainty than a system of tenders in London. In order to put in their tenders in London, the exchange banks I understand have to cable early on the morning of the day fixed for the sale, and they do not hear the results till the next morning, so that the time that elapses between the time at which they have to put in their tenders and the publication of the results is less in the case of tenders in Calcutta than in the case of tenders in London.

1050. Don't you think that objection is an objection to the tender system?—I think it is.

1051. (*Sir Reginald Mant.*) Mr. Denning, you said just now that the tender system is useful when exchange is fluctuating, but not when it is stabilised. Even though exchange may be stabilised in the ordinary sense of the word, there will always periodically be fluctuations between the upper and lower gold points—will there not?—Yes, I imagine so.

1052. There will be a considerable period of fluctuation even with a stabilised exchange?—Yes, between the gold points.

1053. You would agree then, that the tender system is an advantage when exchange is fluctuating between the gold points?—That is rather too general a statement of the case. I said there are advantages in the tender system when exchange is fluctuating and inclined to be weak and Government wish to remit. If exchange is fluctuating and tending to be strong, then I think it is perfectly easy to regulate purchases of sterling so as to let the market up gradually.

1054. But you gave an instance, didn't you, of a rising market?—No, I gave an instance of a weak market.

1055. No, you said you didn't know when to come in—at 1s. 6⅛d., was it not?—I gave as an instance January to March of this year, when exchange was inclined to be weak and to drop below 1s. 6d. It had been strong. We had been purchasing sterling at the end of December at 1s. 6$\frac{5}{32}$d.

1056. Do you say there is no advantage in the tender system when exchange is rising but is still below the upper gold point?—I don't see any advantage in tenders when the trend is definitely upwards; for instance, I think the way in which the remittances have been made since last May, when exchange first went above 1s. 6d. up till now when it is 1s. 6$\frac{3}{16}$d. has given fairly general satisfaction to everybody concerned. I do not see how the supplementing of purchases of sterling in such circumstances by an offer of councils would have offered any advantage at all.

1057. You could not have got better rates at times?—I think that is very unlikely. I distinctly remember instances when the rates at which council bills were allotted by the Secretary of State were distinctly below the rate at which I could have purchased on the very same day in Calcutta.

1058. (*Mr. Preston.*) Mr. Denning, would not the present system if kept in force rather give the Imperial Bank an undue advantage when they were dealing in exchange on their own behalf if before a rise or fall in the bank rate as they alone knew what was going to come along?—I do not quite follow.

1058A. Let me straighten it out. Supposing next week the Imperial Bank were going to drop their bank rate from 8 to 6 per cent. Exchange naturally would become weak. Now they alone would have that knowledge as against the market and by the present system they could operate to the disadvantage of the market. Would not that be correct?—They would operate, but would it necessarily be against the market?

1059. Well, they might be operating on their own account. It might be even to the disadvantage of Government?—But you must assume that the powers of the Imperial Bank will be limited, as I state in my memorandum. I say that their powers of dealing with the public should be nil, except in so far as they have to make remittances for their own constituents.

1060. (*Chairman.*) Let me develop that, Mr. Preston, with one or two leading questions, and then perhaps we will get the whole matter fully elucidated

as we are now on this point of the Imperial Bank and remittances. Have you any further questions to ask, Sir Reginald?

1061. (*Sir Reginald Mant.*) Yes, I hadn't quite finished. Mr. Denning, you recognise that there are certain disadvantages in the system of purchases of sterling. You gave one instance in which there was undesirable speculation?—That, I say, was because a certain banker made a surmise. I admit that I was inexperienced at the time. I took steps later to prevent similar speculation by varying the amount of my limit.

1062. Have you had no complaints otherwise of certain parties being favoured as against others in purchases of sterling?—I have had no complaints.

1063. The Bombay Chamber of Commerce, for instance, have made a reference to it in their memorandum.* They say "Their Committee are strongly of opinion that Government remittances should be effected by means of public tender, either in London or in India, rather than by private purchases of sterling as the former method is more equitable and promotes a greater feeling of confidence in the minds of the public"?—I do not see how it is more equitable.

1064. Well, I presume they mean that the amounts will be published and everyone will be at liberty to tender?—But everybody is at liberty to sell sterling through any broker or direct to the Imperial Bank.

1065. They don't know how much you are trying to buy. I am only trying to elucidate what they mean?—Quite; I don't see anything in that point.

1066. They say it will create a greater feeling of confidence in the minds of the public?—I don't see quite how it is going to create a greater feeling of confidence with the public. As far as I know, there have been no complaints against the system of purchasing sterling this year.

1067. Of course, we shall have to clear up this subject with the Bombay Chamber, but I wanted to know whether, from your experience, you could throw any light on it?—While I think there have at times been speculation, but the purchases are now so regulated that speculation is practically impossible.

1068. (*Sir Alexander Murray.*) Mr. Denning, with reference to the position indicated by Mr. Preston, where the Imperial Bank, acting on inside information of a likely rise in the bank rate might operate in exchange taking advantage of their position under the present system, if the Imperial Bank were prepared to act upon inside information under present conditions, would they not be prepared equally to act under a public tender system?—Not quite equally.

1069. Why?—Because they would have to announce the amount; that is usually done under the present system; they would announce the amount for which they were asking for tenders and the public would have some indication of the extent of their operations. I admit that so far as the rate is concerned there will be no difference.

1070. (*Chairman.*) I understand you to mean that, under the tender system, if the Imperial Bank were to act in this manner its operations would become more obvious to the public eye?—Yes, I think so.

1071. Some of the supplementary questions referred to the state of affairs which would prevail supposing the Imperial Bank were to take over the remittance business of the Government. Will you tell us generally what are the relative advantages and disadvantages of such a change?—I think that question is mixed up very closely with the control of the note issue. It is rather difficult to answer the question without considering the advantages of transferring the note issue.

1072. Would it enable you to answer if you were definitely to assume that the note issue were transferred?—Assuming that the note issue were transferred to the Imperial Bank, I think that it is almost inevitable that the control of the remittances should be transferred at the same time. If the Government are remitting independently, their remittance policy might come right up against the money policy of the Imperial Bank, and the remittance operations of the Government are so large that they might nullify the action taken by the Imperial Bank in pursuance of its policy. Another point is that Government would not have the same facilities for remittance directly. At present part of their remittances are made on behalf of the paper currency reserve. If the paper currency reserve is handed over to the Imperial Bank such remittances must cease. If Government retain the gold standard reserve, that might possibly be used to some extent, but the greater part of the Government remittances would have to be met from the Treasury balances, and it would not be possible to arrange remittances so conveniently as it is possible to do now.

1073. Supposing the transfer of this business were to be made to the Imperial Bank, what is the nature of the agreement which you would suggest between the Government and the Imperial Bank under which the bank would transact the business for the Government?—The bank should, I think, undertake the obligation to supply the Secretary of State with funds as required in London against payment in India in rupees; and assuming that the Imperial Bank is responsible for the maintenance of exchange, either directly or by the influence of its discount rate, I think that it ought to be laid down definitely that Government would never borrow in London merely in order to lessen its demands on the Imperial Bank. It might want to borrow in London because it could not obtain sufficient funds in India to meet capital requirements, but that would be the sole criterion for borrowing in London. Except in so far as the Secretary of State met his requirements by borrowing in London upon those lines, the Imperial Bank should undertake the obligation to supply all funds required.

1074. Supposing that such a definite obligation were undertaken by the Imperial Bank under the suggested agreement, do you consider the arrangement would be open to criticism on the ground that it gave a preference to Government over the public in the market at times of great pressure for sterling?—I do not quite see why it should.

1075. To put it roughly, when there is not enough to go round the bank would be under the obligation to give the Government all that there was and the public would have none?—I think the Imperial Bank would always have to supply the sterling required, both by Government and their constituents, even if they had to borrow temporarily in London to do so.

1076. Finally, to complete the picture, assuming that this arrangement had been made, what essential limitations upon the capacities of the bank to transact business in exchange would you suggest?—I suggest that they should not be allowed to deal direct with the trading public at all, but should be permitted to buy and sell in India from the exchange banks and possibly a few firms which have always tendered for councils, and that the banks and firms from which the Imperial Bank might buy should be put on a list which would have to be approved by Government, that is, their buying and selling would be limited to buying and selling from certain banks and firms on the list approved by Government. In addition, they should be allowed to make remittances to London for their constituents for *bona fide* purposes as they are doing now, and there might be a further limitation that the amount that they should buy and sell in any one transaction with an exchange bank or a firm should not be less than £10,000. Further, I think that the operations of the London office of the Imperial Bank should be limited strictly to remittances for *bona fide* constituents.

1077. That is the tale of restrictions?—I think that is the tale of restrictions.

1078. (*Mr. Preston.*) I would just like, with reference to my previous question, to put this: that if public tenders were adopted, would not that once for all remove all and every difficulty of Government

* App. 16.

getting all weekly requirements in the market? The point was raised when the statement was made that there might have been a possibility, where the bank was operating for Government, the bank might give all their purchases of sterling to the Government and the market get none?—I do not think the market was intended. I tried to make that clear. I thought that the constituents of the bank were intended.

1079. (*Chairman.*) And perhaps you should also regard it from the point of view of the market as Mr. Preston suggests?—Can that possibly arise?

1080. (*Mr. Preston.*) If you make the tender public you undertake to buy a certain amount of sterling. The Imperial Bank operating as they do at present might buy your requirements, and then they might conceivably say for the remainder of the week to the market, "I am not buying further"?—Yes, but during the period when the Imperial Bank is buying anybody has a right to sell to them.

1081. Granted, but markets change from morning till afternoon; Monday and Tuesday there may be no move in the market; during the balance portion of the week there may be heavy movements?—Quite, but assuming that you had a weekly tender various exchange banks and firms might put in for tenders on Tuesday, and the market might be absolutely different on Friday.

1082. What I would say is that if you have a public tender for a weekly amount the market always gets its portions of that amount at the average rate?—Provided it overbids the other man.

1083. Exactly, but still the market knows that there is, say, a crore of rupees or a million pounds put up, and that provided they bid the rate they will get their proportion of the tender or the whole of it?—That is true.

1084. (*Sir Henry Strakosch.*) May I ask Mr. Denning with regard to the question that has been raised regarding the advantage that might accrue to the Imperial Bank in the exchange market because it is in possession of the knowledge as to its own bank rate policy, on the supposition that the Imperial Bank becomes the note issuing authority with the obligation to maintain the exchange value of the rupee, would you agree that it is a perfectly legitimate thing for the Imperial Bank to use the only legitimate weapons there are to maintain the external value of the rupee, namely, the bank rate, and direct intervention in the exchange market?—Yes, I think it would be legitimate.

1085. Not only legitimate, but absolutely essential to its functions?—At certain times essential.

1086. Now if it is essential to its functions to operate in the exchange market, is it not logical that the Imperial Bank should have the utmost freedom in its dealings in exchange?—I would say the utmost freedom provided that it is not allowed to compete unfairly with the exchange banks.

1087. Yes, but is it not conceivable that the policy of the exchange banks may be running counter to the policy of the Imperial Bank? The Imperial Bank may think it necessary to contract credit in order to appreciate the rupee, and the exchange banks may be of a different view. Whose view is to prevail, and whose duty is it to carry into effect the policy; obviously the Imperial Bank?—I should like to think out this point a little more, because you are in effect, I understand, suggesting that the Imperial Bank should be allowed to deal directly with the trading public.

1088. Well, what I suggest is that the Imperial Bank if it acts as the Banker's Bank would in the ordinary course of its business not deal with the public except with its customers, who will be the banking institutions of the country; but I would not by statute debar them from dealing if they think fit, and if in their view it is essential that exchange should take a certain course?—I think that might have advantages, but I should like to think it out more, because I have never contemplated such an arrangement.

1089. (*Chairman.*) The question, I suppose, to which Mr. Denning would direct his attention is whether the Imperial Bank would discharge its essential functions as regards the control of exchange within those limits as to trading and exchange which Mr. Denning has specified?—I think on the whole that it would be able to exercise its functions adequately.

1089A. (*Sir Henry Strakosch.*) With the limitations you put?—Yes, I would say that in effect the limitations placed on the Imperial Bank are the limitations already placed on Government operations. At present Government purchases only from exchange banks and certain firms and Government does exercise its functions of controlling the exchange without dealing direct with the trading public. I do not see any reason at present why the Imperial Bank should not do the same.

1090. Then one other point regarding the agreement between the Government and the Imperial Bank with regard to the supply of sterling remittances to the Government. Would it not be the Imperial Banks' duty, having entered into the agreement, and having undertaken the obligation to supply the Government with exchange first and the public after, therefore to give the Government as compared with the public the advantage which accrues to anyone who is first in the market?—I am not sure that the question would arise as to whether the Government should be given sterling in London or the Bank's constituents. I think in practice the bank would have to arrange to supply both. If it had temporarily not been able to remit enough from India for that purpose, I think it would have to borrow the money in London in order to meet its sterling obligations.

1091. My question then is, why make an agreement, because the Imperial Bank under its statute would be obliged to keep the exchange value of the rupee between the two gold points?—Yes.

1092. It therefore has to supply any demand for sterling within those points by statute?—Why is it necessary then to say that it must supply the Government with the whole of its requirements?—It is necessary because if you treat Government as an ordinary constituent of the Bank, in its capacity as a consituent it has to enter into some contract with the Bank as to the supply of funds, and the contract would be that the Bank must supply all the funds required. If there is no obligation to that effect there is nothing to prevent the Imperial Bank saying to the Secretary of State when he asks for a million pounds or two million pounds, "it is not convenient for us to supply it now."

1093. The Imperial Bank, I take it, would act on behalf of the Government of India merely as agents and the Imperial Bank would buy whatever exchange there is to be got and at the same time being obliged to give sterling at the gold point, the Government can never be in danger unless the Imperial Bank fails to comply with the provisions of the statute?—I think that you must have something down in the agreement that the Imperial Bank will supply all the demands which the Secretary of State makes in sterling on payment by the Government of India of the equivalent amount in rupees in India. That is undertaking a definite piece of business for a constituent, the constituent being Government, and unless there is an agreement between the Bank and the Government, I do not see why the Imperial Bank should not refuse to put through any particular transaction of that sort at a given moment.

1094. But then all the other banks are there to supply the Government?—Yes, presumably they are. But the time the Imperial Bank would choose to refuse would probably be a time when it would be

extraordinarily difficult for the Government to put the transaction through any other banks.

1095. If they refuse they have broken one of the essential conditions of their statute which provides that the Imperial Bank has to sell sterling at one point and buy it at another.—I do not see that the conditions of their statute would necessarily be broken. Supposing exchange is at par, midway between the gold points; the statute imposes upon them no obligation to buy or sell; they could simply keep out of the market. On the other hand Government wants certain funds in London, and must get those funds either by direct remittances themselves or by remittances through a Bank. I say that there should be a definite obligation by the Imperial Bank to supply those funds when required, and I think that obligation must be incorporated in an agreement between the Bank and the Government.

1096. (*Sir Reginald Mant.*) Mr. Denning, at what rates do you contemplate the Bank should undertake to supply remittances for Government? Would you take an average rate?—I think on the whole the best rate would be the average rate for the month preceding the date of drawing by the Secretary of State from the Bank.

1097. And the Bank would then be under an obligation to supply any amount required by Government at the average rate of the preceding month?—Yes; I predicate that the Secretary of State would give the Imperial Bank an estimate well in advance of the amount of his probable requirements and would state definitely a month in advance the amount of his drawings. If he were drawing in August, he would have to give on the first of July notice to the Bank of the amount which he was going to draw in August so that the Bank would have the time to make the necessary arrangements and the Secretary of State would be definitely bound to take that amount. He could not suddenly say "I do not want so much. I will take a little less". He would have to take that amount, and in the present circumstances transfer tho balance to the Bank of England.

1098. As you know under the present arrangement under which the balances out here carry no interest and the Secretary of State gets interest on his balances in London, it often suits him as an economical arrangement to make large remittances from the balances here to his balance in London at a period when exchange is strong and it also suits him to get a large portion of his annual requirements in advance when the exchange is strong?—Yes.

1099. Do you contemplate that arrangements of that kind would continue under the new arrangement?—No; I think there are two separate points in your question; one is the question of levelling out the balances in India and the second is the question of the rate at which Government will obtain its sterling. As regards the regulation of balances in India, I think it is possible to achieve much the same results as we are achieving now by issuing treasury bills for short periods which would carry us over the times when our expenditure tends to exceed our revenue.

1100. Treasury Bills in India?—Treasury Bills in India. They would probably never be outstanding for more than six months. It is possible by regulating treasury bill issues to produce a practically even balance in India all the year round. We would have lower balances on the whole too. As regards the rate of exchange I agree that Government might not obtain their remittances, and probably would not obtain their remittances at so favourable a rate. The tendency now is for the Government to remit in the busy season when exchange is strong, lend that money out on the London market until the slack season when it is required and exchange is weak, and it is not desirable to remit; so that on the whole the average rate obtained by Government for remittances is a high one. Under the system I propose, the rate obtained by Government would be approximately the rate prevailing for the time being, that is to say, it would be the average of the rate prevailing throughout the year and the effect would be that the gains by Government on exchange would be less. The amount that Government lost would go to the Imperial Bank, if they arrange the remittances upon the same basis that we arrange now and that could be regarded as remuneration to the Bank for the business they had undertaken on behalf of Government.

1101. But do you contemplate that the Secretary of State should not in future be entitled to anticipate his requirements?—I contemplate that he should only draw as required for current expenditure.

1102. (*Sir Purshotamdas Thakurdas.*) Would the responsibility for maintenance of exchange which you propose should be put on the Imperial Bank entail any risk at all of loss on the Imperial Bank?—I do not think so.

1103. You don't think that the Imperial Bank rnns the risk of any loss by honest errors of judgment by the people who may be operating on their behalf?—That is possible.

1104. You have already said that the amounts which have to be remitted from India by Government are colossal and have no parallel in any other part of the world?—I think so, yes.

1105. Do you know of any Central Bank with power to issue its own notes replacing Government currency notes having such liability for maintenance of exchange put on to it?—No, I do not think I do.

1106. The proposal here is that the Government notes should be withdrawn and should be substituted by the Imperial Bank currency notes. The Imperial Bank is a commercial institution and side by side with the other risks of loss which they incur in their ordinary course of business, one more source of possible loss due to honest errors of judgment is being added on to it.—Yes, I agree that the larger the functions of the Bank the greater the possibility of loss from mismanagement; but on the other hand the larger the functions of the Bank also presumably the greater the gains, and I am, as I have pointed out just now, presuming that the Bank will, on the whole, gain by their exchange operations.

1107. They may or may not?—Well, I think almost certainly they will.

1108. You mean there is no room for an honest error of judgment which in exchange operations may land them in losses?—I did not say that. By an error of judgment it is possible there may be a loss—but an error of judgment is really mismanagement for the time being.

1109. I then wanted, Mr. Denning, to ask you, knowing India as you do, where rumours are very liable to exaggeration, whether the note issue of the Bank may not suffer under some peculiar circumstances owing to rumours of loss by the Imperial Bank? Do you consider that this liability should be put on the Imperial Bank?—I think the contingency is remote. I see no reason to believe that the losses incurred by the Imperial Bank on their exchange operations would be known to the public.

1110. You are going on that presumption. But, if they happen to be known to the public through the exchange banks or through other sources which are well up in the exchange operations, would you consider that a risk to be avoided?—I do not consider it a serious risk.

1111. You have said in paragraph 8 I think in your memorandum on the gold standard exchange that the ideal that is to be aimed at is the system in force in England?—Yes.

1112. What difficulty is there in acting up to that ideal in India?

1113. (*Chairman.*) We are getting rather in advance of the examination in connection with this point.

1114. (*Sir Purshotamdas Thakurdas.*) No, Sir, it is just in connection with the liabilities put on the

Imperial Bank. I am restricting myself strictly to that. You set out your ideal there. What objection is there to aiming at that ideal being achieved as far as the Imperial Bank is concerned?—That ideal necessitates a complete change of the currency system. That really is covered to a large extent by my memorandum and is a big subject rather disconnected from the risk incurred by the Imperial Bank.

1115. I was coming to that. I was wondering whether what you mention in the next stage—the legal tender of metallic currency being dispensed with in India, would you consider it advisable not to saddle the Imperial Bank with this liability by remitting money to England?—No, I don't see any objection to putting this responsibility on the Imperial Bank.

1116. It is indispensable for Government to insist on their being responsible for remittances on behalf of the Government of India to the Secretary of State?—I don't think it is absolutely indispensable.

1117. It could be dispensed with?—I think it is quite possible to imagine the Government making its remittances direct. But I do say that that would lead to clashes between the policy of Government in making remittances and the policy of the Imperial Bank.

1118. (*Chairman.*) That was your previous answer.

1119. (*Sir Henry Strakosch.*) I should like to ask some supplementary questions with regard to the points raised by the previous speaker: they seem to me rather important. The question has been asked whether there is any central bank in existence which has the right of note issue and which at the same time has undertaken the obligation to maintain the exchange value of its money. The answer was "no."—Yes, Sir.

1120. May I remind Mr. Denning that Germany, Austria, Hungary, Holland, Switzerland—the national banks of these countries are in that position and also the Bank of England by its obligation to sell gold at a given figure?—Yes, I am afraid that I understood Sir Purshotamdas's question to mean to maintain the stability of the currency under a gold exchange standard. That does not apply to the Bank of England. I am not quite sure how far it applies to the others.

1121. Now, then, the question was raised whether the encashment of the notes may not be endangered by possible losses which the Imperial Bank may suffer through having undertaken to maintain the stability of money, the exchange value of money. Is it not a fact, that if the Imperial Bank has under its control the whole machinery of currency management, it is in a position to maintain the purchasing power of its money stable, just as the Government of India has kept it stable—with the exception of catastrophes such as war. Is that so?—Yes, I think so, provided it has the necesary reserves.

1122. Would it be correct to say that in theory as well as in practice the Imperial Bank, provided it keeps its money stable, cannot make any loss because it will buy at the lower gold point and sell at the higher gold point, which means in other words that the Imperial Bank must make a profit?—Yes, I think that was a point I made. But Sir Purshotamdas was asking about a possible loss due to an honest mistake of judgment and those losses would probably occur. But, generally speaking, if the business were properly run I agree that they must make money over it.

1123. Therefore, is it correct to say that the Imperial Bank cannot make any losses on exchange dealings, but if it does make losses, it makes them because of incompetence of its officials or the failure of some of its customers to fulfil their obligations. It is really loss on credit, not loss on exchange dealings?—I think that there might be losses on exchange dealings.

1124. How? Let me put it this way; because that will eliminate frills. The bank is obliged to buy at a given point and sell at a given point. There is a margin of let us say one per cent. The bank buys at the cheapest rate and sells at the highest rate—by statute?—Yes, but its operations are not confined to that. If it only buys at the highest rate it would probably not buy sufficient in the course of the year to meet the sterling requirements of Government. It has to sell in addition to buying to maintain the stability of the rupee—it has to buy in order to supply the Secretary of State with funds. And in those buying operations it might lose—it might possibly buy at a low rate and have to supply the Secretary of State at a higher rate, if it did not manage its business properly.

1125. But if it buys on commission, as I suggested before, on behalf of the Government of India, it would never lose?—No, if it buys on commission, it would not lose.

1126. Therefore, the contract which Government proposes to enter into with the Imperial Bank might land it in a loss through the fact that it would have to supply exchange at the average rate of the month. That is what you have in mind?—I only say it might land the bank in loss if the exchange operations of the Bank were mismanaged. I say that normally the Imperial Bank would remit when exchange was strong and keep out of the market when exchange was weak.

1127. And would you consider that these losses might endanger the convertibility of the notes of the bank? Could the loss be so formidable?—No, I don't think so.

1128. (*Sir Purshotamdas Thakurdas.*) I said "exaggerated by rumour." I did not suggest that the losses by themselves might endanger.

1129. (*Chairman.*) We will put it as a question to the witness. Do you see any possibility of serious danger in the exaggeration by rumour of such a loss on the part of the bank?—No, I don't see it.

1130. (*Sir Henry Strakosch.*) Is it not a fact that almost every central bank is in the habit of publishing weekly its returns and showing weekly the amount of foreign currencies it holds in its issue departments? Does not, therefore, the public know exactly the state of the bank's position in regard to the holdings of foreign exchange?—Yes, I think the public would.

1131. Therefore, there cannot be, except in the interval between one return and the other return, any misconceptions as to the position of the bank?—I am not quite sure. I do think you mean quite the same as Sir Purshotamdas even now. What I think Sir Purshotamdas means is this. The bank incurs an exchange loss. The rumour gets round the bazaar that the bank has lost a large amount of money. This rumour proceeds all over the country, and in the course of proceeding all over the country the amount of money which the Imperial Bank is supposed to have lost is grossly exaggerated. People up-country say to themselves: The Imperial Bank has made a loss, so many lakhs or so many crores. We are not sure of the soundness of this bank in view of this loss. We will go and present our notes and get metal. I think that is what Sir Purshotamdas means. Well, I say the risk of anything of that sort happening on account of an exchange loss by the Imperial Bank is exceedingly remote.

1132. (*Chairman.*) And the reserves are there to meet it. May I put it in this way. Might it not be the case that the same circle that is likely to be affected by a rumour as to exchange loss on the part of the bank would be approximately the same circle as would acquaint itself with the weekly published returns, so that the remedy might be available where the disease might be caught?—Well, I am not quite sure that that is correct, because rumours grow in the bazaar and the ordinary inhabitant of the bazaar is not accustomed to reading the statements of the Imperial Bank.

1133. We have it now that in your opinion there would be a possibility of some loss on the part of the

bank in the conduct of these remittance transactions. Does not a precisely equal risk attach to their present operations conducted on behalf of Government?—No, because they act merely as the agents of the Government.

1134. I beg your pardon. Is the Government itself not liable to a precisely equal risk in view of the operations that are transacted in its behalf?—Well, it is not so much a risk of loss as a failure to realise a gain, I think.

1135. Is there any difference in the case of the bank under the proposed arrangement and the case of the Government under the present arrangement?—No, none.

1136. What is the actual experience as regards the realisation of a loss in this respect, or, as you have put it, a failure to realise a gain?—The actual experience of Government has been in normal years a very considerable gain by its exchange operations.

1137. Is there any experience of a loss in recent years under modern conditions?—I don't remember one. But I should have to look that up. I don't think there has been one.

1138. We must take it then that the normal experience has been that there has been a gain?—The normal experience has been a gain undoubtedly.

1139. This might perhaps be looked upon as casting some light upon what the prospects of the bank would be of making a loss or realising a gain under the new arrangement?—Certainly.

1140. (*Sir Alexander Murray.*) Do I understand this proposed agreement to be entered into between the Government and the Bank will be one under which the Government will make certain it gets the average rate for a month or year for its remittances, leaving it to the Bank to make profits or losses as may happen. In other words, they are to have a certainty on their side, leaving the Bank with uncertainty on its side?—No, Government is not to have a certainty. I say that the funds drawn in any one month will be drawn at the average rate of exchange of the previous month. So, in effect, the rate at which Government will draw will follow the fluctuations of exchange.

1141. In the past, Government used its discretion in its exchange policy and sometimes found it desirable to sit out of the market altogether for weeks and months on end. If a question arises of the Imperial Bank in the exercise of its discretion wishing to do the same thing, who is to decide whether they are right or wrong?—They would have to decide, as they would be in control of exchange and the remittance operations generally.

1142. And Government then will just have to take the remittances as the Imperial Bank chose to give it to them?—Oh, no; Government would draw what it required each month. It would not inquire when the Imperial Bank remitted those particular amounts. The Imperial Bank would remit them when they liked but it would have to pay them as required.

1143. For all types of expenditure—revenue and capital expenditure—in London?—Yes.

1144. (*Sir Henry Strakosch.*) Therefore, if I may continue, the Imperial Bank under such an arrangement stands to make losses because it may buy at a point which makes the cost to it higher than the average of the month?—Yes, but I think we have touched that point before, and I say, if they manage their business properly, there would be, judging from the experience of Government, a very considerable gain. Before the War the differences between the rates at which Government remitted and 1s. 4d. were taken to the head "Gain by exchange." In every year there was a fairly large credit to this head.

1145. But would it not mean that the bank would have to speculate as to what the average of the month is going to be? They have to sell to Government at the average of the month. Therefore, unless they hit the right figure and buy at a figure in the market which will afterwards turn out to be the average, to that extent the bank is speculating?—I think I must explain a little more clearly how I imagine the bank would conduct their operations throughout the year. I imagine that the bank would conduct their operations throughout the year in much the same way as Government conduct their operations now. In the busy seasons when exchange is strong, Government normally remit large amounts. They may remit a portion of that amount through tho paper currency reserve and create currency against it. I imagine the Imperial Bank would have to do the same thing to some extent. To a certain extent also they remit and keep it in their Treasury balances in London in the form of Treasury Bills. Well, it would be for the Imperial Bank to decide whether it paid them and I think it would pay them to remit amounts in excess of their immediate requirements during the busy season when exchange was strong, and keep it in London in the form of Treasury Bills which might or might not be placed in their currency reserve. It would probably pay the Imperial Bank in the same way as it has paid Government to make most of its remittances at periods when exchange was strong and to keep the money so remitted in one form or another in London until required for meeting the Secretary of State's demands. If they arrange their operations in this way there would be a considerable gain by exchange over the whole year.

1146. (*Mr. Preston.*) Mr. Denning, with reference to your last remark, in Appendix XI to your memorandum giving the history of the Indian currency system, at the end, the sterling purchases in thousands are given:—

On the 8th October, 1924 ...	2 million sterling.
On the 9th October	£1,920,000
On the 29th December ...	£2,220,000
On the 6th June	£1,330,000
On the 24th June	£1,315,000
and then again, given lower down,	
On the 29th August, 1925 ...	£2,290,000
On the 14th September ...	£1,080,000

1147. Would it be a fair question and would it be right to assume that these represented Government transactions?—These are the sterling purchases on behalf of Government. They don't include anything else.

1148. It was no operation on the other part of Government? These are purely commercial transactions?—The remittances were actually made.

1149. Just so; but they did not represent transactions of yours on the other side of the book in any way?—You mean I was not selling sterling on the other side?—No, I was not.

1150. That was a purely market transaction?—Yes.

1151. (*Chairman.*) In other words, it was not a flutter.

1152. (*Sir Alexander Murray.*) Mr. Denning, you said that in pre-war days the Government always made a profit on the basis of exchange at 1s. 4d. Admitting that it did, it does not follow that the Imperial Bank is going to make a profit because the profit is going to be made on the average remittances of the preceding month, not on the average rate of 1s. 4d.—No, but let me take a case in point. We will go back to last year.

1153. You said that previous to 1914 the Government of India always made a profit on their budget rate through their exchange transactions and therefore there was no reason why the Imperial Bank should not do the same. Then, you proceeded to say that the Government took the budget rate at 1s. 4d. and always made a profit on it. I quite believe it because the average rate was usually above 1s. 4d. But that is a different matter entirely from suggesting that Government will take their average rate

for remittances at the average of the preceding month and leave it to the Imperial Bank to make a profit or a loss.—I don't say it is exactly the same thing. But I say there will be still very considerable gains by exchange on the bank operations, taking the whole year together.

1154. (*Chairman.*) Then, Mr. Denning, I should like now to turn to another topic, that is, the problem of stabilisation. I should like to ask you in the first place whether, in your judgment, there are any factors still uncertain in the general world position of a sort to make it prudent to await their determination before fixing the rate of exchange for the rupee?—No, I think there are no uncertain factors of such importance as to justify the postponement of the stabilisation.

1155. Are there any factors of any importance?—Well, there are such uncertain factors as the fate of the franc, the settlement of the inter-allied debts, which might exert a very distinct influence over general financial conditions throughout the world. But when England, practically the whole of the Empire and the greater part of Europe have decided on stabilisation, it seems to me that there is reason to believe on general grounds that there are no serious factors which India ought to regard as of sufficient importance to postpone stabilisation.

1156. What importance do you attach in this connection to the circumstance that there is a large amount of gold in the United States and that there may be a possible change in the monetary policy in the United States?—I think it is possible that the gold in the United States might be so used as to produce a very considerable rise in gold prices. But I do not see any particular reason to suppose that the Federal Reserve Bank will change its present policy of sterilizing a portion of its excess gold.

1157. Can we take it then that you are definitely of opinion that the present is a favourable moment at which to undertake stabilization?—Yes.

1158. And that there is nothing to be gained in comparison with the advantages of stabilization by waiting?—No, nothing I think.

1159. In this connection, apart from the question of index numbers which has already been considered by the Commission in some detail, can you indicate to us any data to show how far prices and wages in India have adjusted themselves to the present level of exchange?—I do not think I can indicate any reliable data except price indices which you have already considered. Statistics of that nature are rather scarce.

1160. Assuming that the rupee should be stabilized, let me ask in the first place if a rate other than the present rate approximately 1s. 6d. were adopted for stabilization whether you can give us a general idea of the magnitude of the difficulties that might be encountered in working (*a*) to a higher ratio (for the purposes of discussion we might take it at 1s. 8d.) or (*b*) to a lower ratio (taking there for the purpose of discussion 1s. 4d.)?—The process of working to a higher rate would in the first place involve a considerable contraction of currency. That might lead to considerable internal difficulties and the failure of a certain number of businesses. In the second place it would probably necessitate Government keeping out of the exchange market, drawing on their sterling reserves and possibly sterling borrowing. In the third place the rise to 1s. 8d. would I think take a considerable time. The contraction of the currency would take some little time to effect and even if Government kept out of the market, it would probably take some time to raise exchange permanently to the new level of 1s. 8d. During this period exchange would be liable to very considerable fluctuations, fluctuations which Government might to some extent temper by going into the market. Then you would have presumably a general fall in prices. During the period of appreciating exchange, undoubtedly the industries of India would suffer very considerably, although in the end when the necessary adjustments have been made, the effects might not be appreciable. During the period of appreciating exchange also it is probable that the producer would suffer, but again I think that would be only during the period of appreciation and when things had adjusted themselves it would make comparatively little difference. That is all I have to say about the question of raising exchange, I think. As regards lowering exchange I think that within a very short time after Government declared that they were aiming at a lower rate say 1s. 4d., the exchange would go down to that rate. In fact I think there would be a very sudden drop. That sudden drop would be followed by a reaction.

1161. Would you expect the fall to go below 1s. 4d.?—I do not think so,—followed by a reaction in which Government would have to come in and purchase sterling to keep the rate down to the 1s. 4d. point, and the amount they might have to increase the currency would probably be very large.

1162. The reaction would come, I take it, from the apparent cheapness of the rupee creating an abnormal demand?—The reaction would come I think partly because speculators who had remitted between 1s. 6d. and 1s. 4d. would bring their money back to India when the 1s. 4d. rate was reached. A large increase in the currency would almost inevitably mean a larger rise in prices and a general adjustment of wages and salaries, but after the period of adjustment is over there is no reason to suppose that any interest in India would be very seriously affected by the change from 1s. 6d. to 1s. 4d. Certain interests would because they would probably not be able to obtain remuneration equivalent to the rise in prices, in particular the people on fixed salaries.

1163. Do these considerations lead you to any conclusion as to the advisability of choosing a rate different from that which at present prevails?—I think it is inadvisable to make any change in the present rate because I see no sufficient reason for putting India generally through the process of adjustment which would be involved by a change either way.

1164. Your preference for the present rate is based therefore rather on the negative basis of the avoidance of the evils of any other course?—Yes, exactly.

1165. Rather than on anything that is inherently desirable in an 18d. rate as compared with any other figure?—Quite. I have no special predilection for that particular figure.

1166. (*Sir Norcot Warren.*) If the rate was fixed at 1s. 4d., would there, in your opinion, be a sudden drop from the 1s. 6d.?—I think so, right at once, within a very short time.

1167. Why do you think that?—Because there is a considerable amount of latent remittance in India which would come forward at once and I think the speculator would say, "This is an extraordinarily good thing, let us get to England all the money we can before the rate actually goes." The more the speculators come in, the quicker the rate would go.

1168. (*Sir Reginald Mant.*) Mr. Denning, with regard to the 1s. 6d. rate is there any particular advantage in having the rate fixed in a round number of pence?—Well, you want either a rate fixed in a round number of pence or an even number of rupees to the sovereign.

1169. Would not the latter be preferable?—I do not see that it makes much difference. The latter has this disadvantage that the method of quoting the rupee sterling exchange would have to be changed.

1170. But supposing the sovereign becomes current in India; 1s. 6d. means that you would get Rs. 13 and one-third rupees to the pound.—I agree it makes it almost impossible to have the sovereign in circulation.

1171. Well, would it be possible to get any figure in that neighbourhood that it would be more convenient to enable the sovereign to circulate?—If it was Rs. 13 to the pound it would not be very far away and that would enable the sovereign to circulate.

1172. Would not that be inconvenient for accounts purposes, the figure of Rs. 13 to the pound?—Is it much more difficult to deal with than a figure of 15? I do not think so.

1173. It was thought so. With 15 you could convert crores into millions very simply?—Yes, I admit that, but you can convert crores into millions comparatively simply at a 1s. 6d. rate.

1174. Yes, you can at 1s. 6d., but it has the objection you pointed out that you could not change the sovereign?—Possibly 13 is not a very convenient figure, but I do not think it is a very serious matter. I do not think the inconvenience of a particular figure for accounting purposes should really have very much influence in determining tho rate at which the rupee should be stabilised.

1175. Do you consider the question of changing sovereigns as of more practical importance?—I do not consider that of importance either.

1176. Assuming that the sovereign does not circulate?—I do not think that makes very much difference. If a gold coinage is wanted in India, gold coinage of so many rupees could easily be minted.

1177. Well, you are assuming that the sovereign would not circulate; but if you had a gold currency the rate of 1s. 6d. would make it necessary to have a special gold coin in India?—I think it would necessitate that, yes.

1178. (*Chairman.*) Passing away from the question of stabilisation, I have first of all to ask you one or two questions in connection with the proposed transfer of the management and control of the paper currency to the Bank. A question peculiarly applicable to you as Controller of Currency is, would the notes by the Bank be likely to be accepted by the public with the same confidence as Government notes?—Yes, I think so. There may possibly at the start be a little hesitation, but the process of substitution would be gradual and I think before the process had got very far there would be no hestitation in accepting an Imperial Bank note as readily as a Government of India note. I think the amount of hestitation might be similar to the amount of hestitation when Government changes the pattern of a note.

1179. Does the experience of the past show that is any hindrance to the note issue?—No serious hindrance.

1180. On the question of the note issue and its acceptability, it may perhaps be a convenient moment to ask you the following question which relates to the scope for the further popularisation of notes. Is there any such scope to be found in raising the limit of universality of notes and could this be done without any great strain on your resources?—I do not think that raising the limit of universality of notes would have any material effect on the popularity of the note issue. Notes of Rs. 500 and over have a very small circulation.

1181. On the other hand, it represents in proportion a very large amount in the economisation of currency compared to small notes. To get one ten-thousand rupee note into circulation is more economical than to get ten thousand one-rupee notes into circulation?—The circulation of notes of Rs. 500 and over is comparatively small, and their circulation is limited to business centres and towns. In those business centres and towns there is no real preference exhibited for metal. In fact, I doubt if there is much scope for increasing the popularity of the note issue in the business centres and towns. Where there is scope for increasing the popularity of the note issue is in the rural districts and particularly in the more backward tracts and in the frontier districts. I do not see how the universality of the Rs. 500 note will affect that in the least.

1182. Your last answer suggests the question as to what in your view is the true policy as regards the issue of the one-rupee note?—Well, my personal opinion is that the issue of the one-rupee note should be resumed.

1183. For the sake of our record, will you tell us the circurstances under which the issue was discontinued?—The circumstances under which it was discontinued were that the Inchcape Committee recommended as a measure of retrenchment that the question of the cost of issue of one-rupee notes should be examined with a view to discovering whether any saving could be made by abolishing the one-rupee note. As a result of this recommendation the question was examined. It was found extremely difficult to frame any very accurate estimate of the cost of keeping a certain number of rupee notes continually in circulation as against the cost of keeping the same number of rupees continually in circulation. In fact, I believe that the result of the calculations was that the cost normally would work out to practically the same. But Government at that time had a large stock of rupees, and those rupees were being made no use of except as cover for the note issue and it was decided that for some years at any rate Government could make a considerable saving by stopping the issue of one-rupee notes and by issuing such rupees as were required from their stocks. I think that was the main deciding factor, the question of saving money for the time-being.

1184. Weighing the benefit of the economy effected by the use of rupees against the benefit to be derived from the encouragement of the use of notes, what conclusion would you come to as to future policy?—My conclusion would be that I think the one-rupee note ought to be re-issued.

1185. (*Sir Purshotamdas Thakurdas.*) Since the one-rupee note was discontinued has it come to your knowledge that the districts which take notes at the time of the marketing of their raw material have taken to the bigger denominations to Rs. 5 and Rs. 10 notes?—Well, I am afraid that I have not collected sufficient information on the subject to give an absolutely definite reply to that, but I will take the jute districts in Bengal which prior to the abolition of the one-rupee note took notes freely and took very little in the way of silver rupees, practically nothing. During the last jute season, Government had stocks of one-rupee notes which lasted about half way through the season. Thereafter they had to issue higher demomination notes and rupees. It was found that there was a large absorption of rupees amounting to 3 or 4 crores of silver rupees in the jute areas, whereas in the previous year there had been a very small absorption, under 1 crore; so that the indications that I have at present are that to some extent at any rate the one-rupee note has been replaced by higher value notes, but also to a considerable extent it has been replaced by rupees.

1186. That is your experience and information about the jute districts. Are you in a position to say anything about the cotton districts of Berar, the Central Provinces, and Gujerat?—I have not any very definite indications, I am afraid.

1187. Regarding the note issue by the Imperial Bank, do you think that it is likely that people may ask whether the notes which are being withdrawn and the new notes being substituted carry the same undertaking by Government or not? When I say people I mean the masses, the general bazaar people? —Generally I do not think they would enquire.

1188. The paper borrowings of the Port Trusts are in the case of the three or four main ports, Bombay, Karachi, Madras, and Calcutta, trust securities, and the other, municipal paper is not trust security. Are

you aware of any difference in the popularity of the two?—There is at present certainly a considerable difference.

1189. What is that due to, Mr. Denning?—I am not sure that it is due to the fact that one is a trust security and the other not a trust security. I think the present difference is due partly to the state of the finances of the various municipalities as against the state of the finances of the various Port Trusts.

1190. You have not heard that investors look at whether certain paper has been admitted to be trust security or not?—Oh, I think they do.

1191. And that it popularly carries in the minds of the people an idea that that paper is backed by the Government?—I have not heard of that.

1192. Take the two Municipalities of the Bombay Presidency, the Bombay Municipality and the Ahmedabad Municipality. The Bombay Municipal paper has the undertaking that the Government are responsible for the interest. The Ahmedabad Municipality has not that. Have you heard that the Ahmedabad Municipality some time back tried to float their paper at 6½ per cent. and, comparatively speaking, failed?—I had not heard it. If I did hear it, I should possibly explain it by other causes than the one you mention.

1193. You do not think that it has anything to do with the Government undertaking to pay interest?—I think it possibly has something to do with that.

1194. (*Sir Henry Strakosch.*) What limitations have been put upon the notes above the value of Rs. 500?—They are limited to the Circle of issue. There are in India seven circles of issue, which cover certain areas; for instance, the Circle of issue at Lahore covers the whole of the Punjab and North-Western Frontier Province. A five-hundred rupee note issued from Lahore is legal tender only in the Punjab and North-Western Frontier Province. It is not legal tender anywhere else in India.

1195. Would you see any great difficulty in relaxing that condition by making these notes of higher denominations payable at all the big centres in India, for instance, Bombay, Calcutta, Karachi, and Madras?—You mean payable at the general centres only. There is an arrangement by which notes of a foreign circle can be presented at any other Currency office and they will be received there on payment of a charge by the presenter equivalent to the charges which we make for remitting funds between one Treasury and another.

1196. Would that not account for the unpopularity of the notes? What I am trying to get at is, would it be a very great difficulty for the Government, or later on for the Imperial Bank, to be ready to encash these bigger notes at any of these centres?—The difficulty at present arises from the fact that it costs a certain amount, usually one anna per cent., or 1/16th per cent., to remit money from one centre to another. That is the general rate. It is sometimes lower. It depends whether the Imperial Bank is prepared to lower the rate; but the Imperial Bank has agreed to remit between any of its branches at that rate, and the Government has undertaken to remit between any of its treasuries at that rate. So the cost of the remittance to the general public from one place to another is usually 1/16th per cent. It is cheaper for remitters of large amounts to cut currency notes and send the two halves in two separate packages insured for a nominal amount to the place to which they wish to remit, to join the notes together and present the rejoined notes at the place to which they have been sent. That is to say, they employ our Currency notes as a cheaper method of remittance, and in the process they destroy our Currency notes because they cut them in half and we cannot use them again.

1197. Having regard to the centres I have just mentioned being very important centres, would you not in the ordinary course keep a very substantial reserve of coin there for the encashment of notes, and could you not rely on the ordinary movement of exchange to settle the difference between the greater amount of notes encashed at one centre at one time?—There is no difficulty in that. The point is that if we make the higher value notes universal, all we should do would be to encourage their use for remittance purposes; that is, we should encourage the public to cut them up into halves and remit them, because it is the cheapest method of remitting.

1198. (*Sir Reginald Mant.*) With regard to what you said about one rupee notes, I understand that when the issue of those notes was stopped a certain number of rupees were absorbed to replace them?—It is very difficult to say anything definite about that, because the process of the withdrawal of notes was a gradual one and during that period when the withdrawal was going on there were a large number of other factors affecting the absorption of rupees. So it is impossible to say definitely that the withdrawal of one-rupee notes has involved the absorption of a certain amount of rupees. As I pointed out, in the jute areas in Bengal it has undoubtedly resulted in the absorption of a considerable number of silver rupees, but it is impossible to give any definite figures.

1199. Quite so. If you re-introduce the note now some of those rupees would come back into your Currency offices?—Yes, I think they would.

1199A. And further rupees would be replaced by paper notes?—I should hope so. Yes.

1200. Would not the return of these rupees increase your present embarrassments in regard to your silver holdings?—What do you mean by our present embarrassments?

1201. I mean that you have got more rupees now than you can conveniently carry. I understand that you have great difficulty in finding places to keep them in?—I think that is only a matter of building new storehouses. It is not a very serious matter.

1202. But it is an economic waste having so much silver which you are not likely to want for years?—There is another way of dealing with it: Government might sell a portion of it.

1203. They might. But that also presents many difficulties?—I don't know: if it were sold very gradually I do not think that it would present very many difficulties. Supposing we sold the equivalent of two or three crores a year, that would not affect the silver market much.

1204. I only wanted to bring out the fact that at any rate the reintroduction of the one-rupee note at present would increase the rupee holding of Government. Would it not?—Probably yes. I think that would be the net result.

1205. (*Sir Alexander Murray.*) May I ask whether you might not wish to modify the reply which you gave to Sir Reginald Mant just now when you said that it would be difficult to get figures to prove that the withdrawal of the one-rupee note has resulted in greater absorbtion of rupees, by referring to your own Report as Controller of Currency for the year 1924-25, at page 48, in which you give the actual comparative figures of the absorption of rupees and notes in the Jute Districts last year, for the year before and the year before that? I have the figures before me?—Just let me explain. As I mentioned in my reply to Sir Purshotamdas, I said we could not judge from last year in the Jute Districts, because for half the year one-rupee notes were available. You cannot judge accurately until you have had a whole season with no one-rupee notes available. In hope to be able to produce some more reliable figures at the end of this jute season.

1206. Quite true. But with notes running only for half the year the figures bear out your point?—Certainly.

1207. In the year 1922-23 you state that the percentage of rupees taken upcountry was only 3 per cent. In the year 1923-24 the percentage was only 2 per cent. Last year, that is, 1924-25, which is the year in which the rupee notes were withdrawn, the percentage of silver rupees taken rose to 16 per cent.,

which on the face of it seems to bear out the suggestion that the actual withdrawal of the one-rupee notes has resulted in silver rupees going into circulation again?—Yes.

1208. And the figures are further supported by your own remarks on page 34 as well as page 48 of your report for 1924-25?—I agree with you; what I said was I could give no exact figures on the subject.

1209. But I am giving figures?—But they do not give an exact indication of what has been happening, because you have not had a period in which the full effect of the withdrawal has been felt.

1210. (*Chairman.*) We come now to the question of the best standard to adopt for the Indian currency, and in the short time that remains to us I will ask you one or two questions to clear the ground for further discussion on the matters particularly suggested in your note. In the first place, referring to the relative advantages of a gold exchange standard and a sterling exchange standard, I would ask whether, in your opinion, there will be a strong popular preference (and I lay emphasis on the word "popular" here) for the gold exchange standard as described by you in your note, in preference to the pure sterling exchange standard as described in Sir Basil Blackett's note?—I think there would be a distinct popular preference, from what I have heard in conversation with people generally who are interested in the subject.

1211. Could you amplify your answer a little by telling us what the state of popular opinion is and what considerations weigh in this matter?—Roughly I think the main popular objection to the sterling exchange standard is that it ties the rupee definitely to sterling, and therefore associates the rupee with all the movements which may take place in sterling. The popular demand in India is that the rupee should have a value which is independent of any management and should have a value which is fixed by statute, automatically in terms of gold. Generally speaking, a gold standard is asked for, and if a gold standard is impossible of attainment immediately, I think that a gold exchange standard would be much more readily accepted than a sterling exchange standard, because the rupee would be definitely linked to the standards of the world and not to one particular currency.

1212. Correct me if I am wrong, but I think the gold exchange standard which you describe in your memorandum allows for no actual holding of gold, but for the exchange reserve being held in various foreign currencies?—It does allow for the holding of gold. In clause (*d*) of paragraph 7 (F) of the memorandum on the "transfer of the management of the paper currency to the Imperial Bank of India" I say "of the metallic holding, not more than 50 crores should be in the form of silver rupees, or silver bullion valued at purchase price, the remainder being in the form of gold coin or gold bullion."

1213. I was thinking of paragraph 4 of the memorandum on the gold standard for India, in which you show that the defects (B) and (C) could be remedied without departing from the gold exchange standard, and then a scheme is outlined for holding, as I understand it, only foreign currencies?—I did not intend that.

1214. (*Sir Henry Strakosch.*) May I interject? Perhaps you have in mind clause 7 of the memorandum on "the transfer of the management of the paper currency to the Imperial Bank of India," sub-section (D) where you find that "all bank notes should be payable on demand in rupees, and the bank notes of the denomination of Rs. 10,000 should be payable on demand in rupees or in foreign exchange at the option of the presentor," no mention being made of gold.

1215. (*Chairman.*) At any rate, we take it now from Mr. Denning that his basic evidence in sketching any scheme for a gold exchange standard is that it should be governed by paragraph 7 (F) (*d*)?—Yes; that is correct.

1216. There should be a metallic holding of not more than 50 crores in the form of silver rupees, the remainder being in the form of gold or gold bullion?—Yes.

1217. That answers by anticipation the question which I was about to ask on that matter. It will be useful at this point to ask you a question which is relevant when we are considering any gold holding in a reserve, whether it be a sterling exchange reserve or a gold exchange reserve, that is a question as to the proper location for the gold held in such a reserve. Will you tell the Commission what is your opinion as to the location which is proper for such a holding?—I do not think it makes very much difference whether you hold that gold in India or in some big financial centre like London, where it would possibly have to be employed in time of necessity. My reasons are that it would be possible to employ the gold if held in India by one of two methods. It would be possible to sell gold as there is nearly always a demand in India for gold, and one could have the necessary effect on exchange by selling gold in India to meet part of the internal demand, thereby decreasing the amount of gold imported. The second method would be to obtain a sterling credit in London against that gold. There are therefore two methods of employing the gold if it is located in India quite apart from shipping the gold to the particular financial centre in which it might be required. I favour holding the gold in India, because there is a considerable popular demand that the gold reserves of India should be located in the country, and I think it advisable to meet that popular demand, as it would make little essential difference in the use of that gold.

1218. (*Sir Henry Strakosch.*) You mentioned just now that gold in India would serve first to stabilise the exchange by avoiding importation of gold which would be imported if gold were not saleable in India, and, secondly, by enabling India to borrow money abroad on the security of gold held in India. Do you think that a foreign bank would lend on gold which is not in its own possession?—I think the Bank of England would lend on gold held in India.

1219. Personally I doubt it?—I think it would. We have held a part of the Bank of England's gold before now.

1220. (*Sir Norcott Warren.*) Might I say to Sir Henry Strakosch they have lent to the Imperial Bank on securities held in India?

1221. (*Chairman.*) Quite a general question on this question of the gold exchange standard and the sterling exchange standard. Taking into consideration what you have just told us as to the popular demand in India for an exchange which is guaranteed against any divorce between gold and sterling; taking into account, on the other hand, the consideration familiar to the Commission of the large proportion of India's foreign trade which is settled in sterling and the still larger proportion of India's foreign trade which is actually transacted in sterling-using countries, what is your opinion as to the relative advantages of the two standards?—The difference between the two standards does not arise until sterling is divorced from gold; and assuming that India remained on a gold standard and sterling were divorced from gold, it would mean fluctuations in the rupee sterling exchange. That, I admit, would probably be an inconvenience to trade; but I think that inconvenience to trade ought to be faced rather than a variation in the standard of the currency in India.

1222. Is it quite right to say that the difference between the two standards does not arise until there is an actual divorce between sterling and gold? In your opinion, would the reserves in normal times that would have to be kept under the two standards be precisely identical?—No, certainly not. As regards the reserves, I admit there is a distinct difference. If a sterling exchange standard were adopted it would probably be very much cheaper.

With a sterling exchange standard it would be unnecessary to keep any gold in the reserves. But on the other hand, the stability of the system would depend on being able to realise sterling investments in London in case of necessity.

1223. In view of that necessity, would you be prepared to say that it would be unnecessary to keep any metallic gold reserve under the sterling exchange standard, even for the purpose, if I may put it in that way, of acting as a buffer against a glut of sales in the security market?—Yes, it would probably act as a buffer; in so far as gold were kept, it would decrease the cheapness of the sterling exchange standard as against the gold exchange standard.

1224. What would become of the balance of expense as against the gold exchange standard?—That would depend on the holding of gold which it was decided to keep.

1225. In your opinion, would it be necessary under the gold exchange standard to keep a larger reserve of gold than it might be considered desirable to keep under the sterling exchange standard? You have given us a figure in your memorandum of a balance of 50 crores?—Yes, I think it would probably be desirable to do so because you would have to be prepared, in the case of sterling becoming divorced from gold, to face the demand for foreign exchange which could be turned into gold.

1226. I understand your proposal is that, under the gold exchange standard, you contemplate that a part of the reserve should be kept in currencies other than sterling?—Yes, I think it might be advisable to do so.

1227. I do not think that you have suggested any fixed proportions or maxima or minima for such?—I have not suggested any fixed proportions.

1228. As a question of practice, apart from theory, would those holdings in other currencies serve any very practical purpose?—Only in the event of the divorcement of sterling from gold.

1229. It would rather be in the nature of a theoretical tribute that the currency was being divorced from gold?—Yes, I think so; it is practically the same.

1230. For practical purposes the bulk of the reserve would have to be kept in sterling?—Yes.

1231. (*Sir Henry Strakosch.*) I have not quite appreciated why the gold exchange standard need be more expensive than the sterling exchange standard, provided that in each case you kept an equal amount of gold in reserve. Why should the one be cheaper than the other?—One is not cheaper than the other, if you kept the same amount of gold in both cases.

1232. (*Chairman.*) Mr. Denning's answer was that, under the sterling exchange standard, he thought you would have to keep a larger amount of gold.

1233. (*Sir Henry Strakosch.*) May I ask why you would keep a bigger amount of gold under the gold exchange standard? Supposing always that your reserve consists, apart from sterling, of currencies that are convertible into gold?—I admit that with a proper distribution of your securities between sterling and securities of other countries under a gold standard it might not be necessary to keep any more gold than under a sterling exchange standard. The point is, I think, really that the transactions by which your reserve of securities would be increased and decreased would be between London and India. And therefore originally at any rate, in building up or increasing your reserve of securities, they would be increased in the first place in the form of sterling. There is no reason why you should not transfer them afterwards to some other country.

1234. You say that in the first instance they would be sterling securities, I take it because the bulk of India's money transactions are with England?—Yes.

1235. (*Sir Henry Strakosch.*) I see. Thank you.

1236. (*Sir Reginald Mant.*) Mr. Denning, do you think that there is any serious risk of sterling breaking away from gold again?—That is rather a wide question. It involves the consideration of whether we are likely to have another world war, for instance.

1237. Quite so—I realise that. But that is your main reason, is it not, for preferring the gold exchange standard to the sterling exchange standard —the main reason is, I understand, the risk of sterling breaking away from gold? That is why I put it?—That is one of my reasons, and the second reason is to meet a popular demand. There are two definite reasons.

1238. Well, you would rather not answer that, I take it. It is too wide?—I think it is rather a difficult question to answer. Assuming normal political conditions, I don't see any reason why sterling should break away from gold.

1239. Take your other reason—the popular demand. How is it expressed? Where do you collect this popular demand from?—I collect it daily by talking to people, and by reading the writings of Indians who are keen on this subject and, to some extent at any rate, represent popular opinion.

1240. But you have not gathered any reasons for it beyond the one that I mentioned, the possible instability of sterling?—Well, I think there are some.

1241. May I just make my point clear? One is a reason, the other is rather a belief, is it not? And I wanted to know whether it is an intelligent belief --whether any reasons had been given you in support of it?—Well, I think the popular opinion is to a certain extent based on the feeling that India's reserves, if they are held in the form of sterling, are not strictly under Indian control, that they are under the control of an authority in London, and that they are not necessarily managed in India's interests. That suspicion is entirely unfounded, but it is there.

1242. Well, then, that reason is unfounded?—I think it is unfounded, yes. But it is there, and it affects popular opinion and the attitude of the representatives of the people towards the Government on currency questions.

1243. You said just now that it would not be necessary to hold gold under a gold exchange standard, that sterling and other gold securities might be held. Was not that what you said just now?—Well, I think it would be advisable to hold a considerable proportion of gold as a buffer.

1244. But I am referring to this popular belief that the securities would be under the control of London and not of India. But under your gold exchange standard, you would hold a large number of securities?—One would hold a certain number of securities. But one would lessen the amount of the reserves of India which would be under the control of someone else.

1245. Would there be any more control—Indian control—over those reserves under that system than under the sterling exchange system?—No, I do not think there would.

1246. So on that ground also the opinion is hardly a reasonable one.—No, I am not suggesting that it is a reasonable one. But it is there.

1247. Then you cannot mention any reasonable grounds that have been given for it?—I don't think I can.

1248. (*Chairman.*) I gather, from what you have told us, that popular opinion on this subject would be comparatively indifferent to where the actual bulk of the securities was held if it obtained the right to get either gold for export or the currency of any gold-using country; and it is on those two latter conditions that emphasis would be laid as a protection of the Indian currency from a divorcement between gold and sterling?—Yes, I think so.—I think that states the case.

1249. As likely as not it would be contented with the formal right to get either gold for export or the currency of any gold-using country, and it would cease to have any strong feeling as to where the actual securities were held?—I think it would cease

probably to have any strong feeling as to where the securities of the reserve were held.

1250. (*Sir Alexander Murray.*) Is it not the case that until quite recently the distinction between a sterling exchange standard and a gold exchange standard did not exist. Right down till war time we heard no emphasis laid upon the gold exchange standard simply because the sterling exchange standard in practice was the same thing, and it is only within the past year, shall I say, if not within the last few months, that emphasis has been laid on the sterling exchange standard as apart from the gold exchange standard.—That, I think, is a reasonably accurate statement of the case, but the fact has been brought into prominence by the divorce of sterling from gold during the war. There has been no other occasion when sterling has been divorced from gold since the gold exchange standard was instituted in India.

1251. In effect the matter is largely academic so long as sterling and gold are not divorced from each other again?—Quite.

1252. (*Sir Purshotamdas Thakurdas.*) Do you think that the Indian public or the popular opinion that you refer to may be based on this, that in view of the experience after the outbreak of war, they feel that if they are on a gold standard in preference to the sterling exchange standard, they may be in better touch with the financial world in case of a serious dislocation and not be tied to what is happening to the pound sterling?—Yes, I think I have made it clear that it does more effectively maintain India's standard in the event of sterling being divorced from gold.

1253. Therefore, that feeling need not necessarily be based on mere sentiment or mere political feeling. There may be something behind it in what I have mentioned.—Oh, yes; I admit that.

1254. (*Chairman.*) That clears the way now for dealing on the next occasion with the question of the gold standard as raised in your memorandum.

(*The witness withdrew.*)

FIFTH DAY.

Monday, November 30th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E.
Mr. G. H. BAXTER. } (*Secretaries*).

Mr. H. DENNING, I.C.S., re-called and further examined.

1255. (*Chairman.*) Mr. Denning, I now want to take you through the memorandum signed by you on a gold standard for India, the consideration of which will enable us to raise most of the remaining points on which we hope for assistance from you. You deal there, in the first place, with the defects of the existing system, and analyse the possibility of remedying those defects by having an exchange standard. In the course of that analysis, you draw attention to the difficulty of amalgamating the paper currency reserve and the gold standard reserve as long as the rupee remains unlimited legal tender. In your memorandum on the Transfer of the Management, you outline a scheme under which the transfer could be effected by retaining a separate rupee redemption reserve under control of the Government. Sir Basil Blackett, in his memorandum on the Currency System, outlines another scheme by which an amalgamation of the two reserves is effected, coincident with the transfer of the note issue under an exchange standard system. Having considered the scheme in Sir Basil Blackett's memorandum, do you find that it at all relieves the difficulties which you describe in your own memorandum in regard to the amalgamation of the reserves?—In my opinion, the defect in the scheme outlined by Sir Basil Blackett is that his liabilities are an estimate in the first place based on a factor which is extremely difficult to estimate, that is, the amount of rupees in circulation, and, in the second place, on the difference between the bullion and exchange value of the rupee which varies from time to time. So his reserve is a reserve against liabilities which are indefinite, and, therefore, it is rather difficult to say whether his reserve is a sufficient one, or whether with such a reserve there might not be a considerable danger of a breakdown of the system from causes which we cannot see now.

1256. Is not some estimate as to the liabilities involved implied even in your own proposals, according to which the present total of the reserves held against this particular liability now in the gold standard reserve, and in future in the rupee redemption reserve, is fixed at a definite figure?—I admit that there is a possibility that my rupee redemption reserve would also not be sufficient to meet certain contingencies. But I do not necessarily propose to keep that redemption reserve on its present level. If it were decided it is not sufficient, it would go on

being increased as opportunity arose. Sir Basil Blackett's reserve would remain constant, except in so far as he would increase it from 25 per cent. of the amount of coinage of rupees.

1257. Sir Basil Blackett's present scheme allows for a proportional increase of the reserve with an increase of liabilities against that reserve?—He assumes that the increase in the liability is only 25 per cent. of the amount of rupees issued.

1258. As you say, Sir Basil Blackett's scheme fixes, apparently once and for all, the proportion of the reserve, but might not that be open to reconsideration with experience just as the amount of the rupee redemption reserve would be open to reconsideration?—I agree, if Government retain responsibility for reserves. It would be more difficult if the reserves were handed over to tho Central Bank.

1259. It would be more difficult; it would involve some negotiations or agreement with the Banking authorities?—Quite.

1260. You refer to the necessity, in estimating the amount of the reserve to be held against this liability under Sir Basil Blackett's scheme, of taking into consideration the doubtful factor of the bullion value of the rupee according to the changes in the silver market. Under Sir Basil Blackett's scheme would that, in your opinion, be a relevant consideration? Would not the relevant consideraiton as to the amount of the reserve be only the contractibility of the currency, looking upon a rupee that came in as the rupee that would go out again some day?—I think that is correct, assuming that there are no facilities for converting your rupees into some other metal.

1261. Supposing that in Sir Basil Blackett's scheme were to be found a practical solution of the difficulty of combining the reserves, would that, in your opinion, remove the chief or a substantial argument in favour of limiting the legal tender of the rupee?—It would remove a substantial argument, but not the chief argument.

1262. I would point out that in your memorandum that is put forward, I think, as really the critical argument for limiting the legal tender of the rupee?—No, I think the critical argument is the danger of the breakdown on account of the rise in tho price of silver.

1263. At this point let me ask you whether, in your opinion, the system of the gold standard currency outlined in your memorandum completely remedies the defect in the existing system that it is at the mercy of changes in the silver market?—Not completely, I think; because the subsidiary silver coinage would be affected. But once having reduced the rupee to a subsidiary coin, I think there is comparatively little objection to reducing its fineness.

1264. Let us envisage the situation. You have, as we have learnt from your estimates, still a rupee circulation of 150 crores. What will be the social as well as the financial reactions upon the uninstructed public, even when the rupee is no longer unlimited legal tender, of a reduction in the fineness of the rupee, or the substitution of an allegorical coin for the rupee, or an attempt to substitute small notes for the rupee circulation?—I think if it were done gradually, the social and economic effects would not be serious. But I do think that they might be serious if an attempt were made to do so as long as the rupee is a full legal tender.

1265. Undoubtedly. But would you not expect to see your subsidiary coinage going to a discount on the hypothesis described, even if the rupee were no longer unlimited legal tender?—I do not think so.

1266. In expressing that opinion you have considered the social effect upon the time-honoured and inveterate reliance, which has been explained to us of the uninstructed public upon the rupee coin and its fineness as the chief circumstance to which they attach importance in their currency system?—I think by going on to a gold standard, you would modify those circumstances very considerably.

1267. There is a minor question upon your description of the objections to transferring the combination of the reserve that I would like to ask. You say in the middle of paragraph 6, "and the liability to redeem silver rupees outstanding would have to be provided for by a separate reserve"; and you give as a reason, as I understand it, that coinage is obviously a function of Government. That suggests the question whether we have not been taught to consider that the rupee is not so much a coin as a note on silver; and that, although coinage is a function of Government, a note issue is in ordinary practice the function of a Central Bank. Do you find anything to enable you to agree with that alternative aspect?—Not very much. I might agree if the coinage of subsidiary coin were also considered a function of a Central Bank; generally speaking, that is considered to be a function of Government.

1268. But we are dealing here with an exchange standard system in which the essential position of the rupee continues to be that of a note. Undoubtedly, under the gold standard system the essential position of the rupee would be that of a subsidiary coin. Under the exchange standard system, while the rupee continues to hold essentially the position of a note, would it not be more in accordance with the ordinary practice in other countries that the control of the rupee issue should be with the Bank rather than with the Government?—I do not agree that essentially the position of the rupee is the position of a note because the rupee carries a large value in itself. The note carries no value in itself, and the profit on the issue of rupees arises in rather a different way from the profit on the issue of notes.

1269. Finally, on this aspect, Mr. Denning, in your analysis of the disadvantagos of the present system, we find disadvantage (*d*) in paragraph 2:—"Although it was possible for the public to obtain as much additional currency . . . by buying Council bills . . . there was no automatic provision for contracting the currency," and then you describe how that is so. What, in your opinion would be the effect of the arrangement which you describe of a separate rupee redemption reserve in the hands of Government in remedying this particular defect?—I think, as a matter of fact, I have overstated the case at the end of paragraph 5 by saying that it is practically impossible to remedy defect (D) without taking away the full legal tender character of the rupee. It could be arranged under the system outlined by mo with a separate reserve for the redemption of rupees.

1270. Correct me if I am wrong, but it appears to me from your statement as if the system would not work automatically the contraction of the currency against the use of the rupee redemption reserve?—I think it would work like this. Supposing the Bank presented a crore of rupees to Government. That would be taken out of their currency reserve. Suppose with that crore of rupees which had been presented to the Government the public had obtained sterling from the Bank to the extent of one crore. The Bank would have to pay out from their sterling reserves in London one crore and they would obtain one crore of sterling resources from Government. Therefore their reserves would, I think, be down by one crore of rupees, and there would be an automatic contraction of the currency.

1271. We may take it that, in a bad year, currency is retained and that the Bank come for a crore of rupees to the Government, against which the Government let out its rupee redemption reserve, so that the Government is a crore of rupees in hand and a crore of sterling credit down. What is to prevent the Government from making use of that crore of rupees?—They can only issue them through the Bank under my scheme.

1272. That would be a part of the agreement between the Bank and the Government, that the rupees could only find their way out into circulation by returning into the hands of the Bank?—Yes.

1273. What is to prevent the Government from arranging with the Bank to demand a crore of rupees and paying it to the credit of Government, say for the purposes of the Raisina works?—What could the Bank do with that crore of rupees if their reserve of rupees was already up to the limit? They could not afford to take back a crore of silver rupees because they could not use them.

1274. (*Sir Henry Strakosch.*) I do not quite follow the procedure in the last case with which you dealt just now. If the rupees come back from circulation and they become redundant in the hands of the Bank, then the rupees return to the Government, and the Government hands out to the Bank a part of the sterling reserve. Is that so?—Yes.

1275. Now then if the Bank had additional sterling reserves, is it not reasonable to assume that those reserves would be used to build upon them additional credit and thus keep the circulation at the same level only in another form?—I assume that the Bank would have to give something for the crore of rupees and I assume that this crore of rupees is received in exchange for gold or sterling. Therefore, the Bank has to pay out a crore of gold or sterling in order to get back that crore of rupees.

1276. So the position would in reality be exactly the same as before, at the time when the rupees were still in circulation?—No, a crore of rupees returns to the Bank.

1277. What I did not follow was, how the currency would be contracted in these circumstances?—You will agree that the rupees will be returning from circulation. That is a definite contraction of currency: and unless those rupees are replaced in some way by the Bank, you have a definite contraction of one crore?

1278. There is another question. I see from this memorandum that it was assumed that the limit of rupees as legal tender under the gold standard is set down at Rs. 50? May I ask why that figure has been chosen?—Rs. 50=75 shillings, and the limit of token coin tendered in England is 40 shillings, and I believe in some other countries the limit is also somewhere in the neighbourhood of 40 shillings. —I think one idea underlying the fixing of Rs. 50 was that it might be desirable in India where the ordinary retail transactions involve the use of a currency of a small denomination to fix a higher legal tender limit than in the rest of the world.

1279. But what would you think of the argument that, if a country is poor, the upper limit of token coin as legal tender should logically be lower?—There is, I think, a great deal in that argument logically.

1280. And would it not, if you fix the upper limit at 50 shillings, make really very little difference in the use of the rupee coin as full legal tender and unlimited legal tender?—I am not sure whether it would make much difference from that point of view whether it was Rs. 50 or Rs. 30. I think to a large extent the rupee will continue to be used and will be accepted as full legal tender just as I imagine is done in other parts of the world.

1281. And if it is used practically as it is being used to-day and if the price of silver were to rise above melting point, then the inconvenience logically would be almost as great under a system where the rupee was limited legal tender up to as high an amount as under a system where it was full legal tender?—I do not say it would be almost as great. I do not say silver will continue to be used as much as it is used now as full legal tender. I say it will still continue to be used to a certain extent.

1282. Well, if the average transaction is below Rs. 50, then I cannot quite follow why it should be used to a lesser extent than it is used to-day.—The occasions on which rupees are most used are at the time of crop financing and the ordinary transactions then are considerably above Rs. 50.

1283. And then may I come back to the first question the Chairman put to you, and that is the question of the total rupee circulation and the two plans, one proposed by you and the other by Sir Basil Blackett. Is it not a fact that in each case we have to estimate the amount of rupees in circulation in order to determine what reserves have to be provided for if the gold standard were adopted?—As between the gold exchange standard and Sir Basil Blackett's sterling exchange standard?

1284. No, I am speaking of the full gold standard. —Well, we have to make an estimate it is true, but that estimate is for the purpose of ascertaining (1) cost, (2) the extent of the gold we shall require and (3) the extent of the general disturbance in the world; that estimate is not going to remain a permanently uncertain feature of the currency system.

1285. But my point is this. Do we not have to make an estimate both in your scheme and in Sir Basil Blackett's scheme as to the total amount of rupees in circulation which has to be protected by the gold standard reserve?—You mean under the gold exchange standard?

1286. (*Sir Henry Strakosch.*) No, under the gold standard.

1287. (*Chairman.*) As regards the gold standard, I think the two schemes are practically identical, not in figures but in mechanism.

1288. (*Sir Henry Strakosch.*) In both cases you have to estimate the amount of rupees in circulation and therefore the likelihood of rupees coming back?—But the difference is that in the case of the gold standard you get rid of those rupees within a period of ten years and the uncertainty is gone; in the case of Sir Basil Blackett's system it will remain a permanent feature of the system.

1289. Then the difference between Sir Basil Blackett's scheme and your scheme regarding a reserve is that he provides that the reserves shall be 25 per cent. Do not you think that that would be sufficient security in the case of rupees flowing back and foreign exchange being in demand?—Yes, I think it might be, but that is a matter of opinion. The reserve is not based on definite facts. It will remain a matter of opinion as to whether it will be sufficient.

1290. But his proposal is that for every new issue of rupee coin the reserve should be amplified by Re 1 for every Rs. 4 put into circulation; and that is the essential difference between his and your scheme. Yours is a more complicated scheme under which you take into account the bullion value?—Well, I suggest it may be necessary to take the whole of the profits on the coinage of fresh rupees to the reserve for the redemption of rupees.

1291. And his proposal is to set aside 25 per cent.? —His proposal is to set aside 25 per cent. and to use the difference.

1292. But if we agree that a contraction of 25 per cent. is probably the maximum that the country can stand, would you then agree that there is a sufficient reserve provided under Sir Basil Blackett's scheme?—There will be a large amount of rupees in circulation and the reserve might not be sufficient to meet them.

1293. (*Sir Maneckji Dadabhoy.*) In answer to the President's question speaking about Sir Basil Blackett's reserve, you said his reserve is a reserve against liability and it is difficult to say if it is a sufficient reserve and you anticipate a breakdown. Will you please tell me at what stage you anticipate this breakdown?—I do not say I anticipate a breakdown; I say there is a possibility of a breakdown.

1294. And could that be averted?—You mean by a modification of the scheme?

1295. Yes.—Well, it is difficult to say. As I say your liabilities are indefinite. Then you provide a certain reserve on an estimate of your liabilities. If your estimate proves very wrong then your system might break down.

1296. Speaking about the reserve for the redemption of rupees, at what level will you keep it; can you suggest a figure?—Well, I think that also will depend upon the policy which is adopted. If, as I

suggest might be done, we were to throw out gold coinage freely, make gold freely available, we should go on using the reserve from the time of the adoption of the new system, because rupees would, to a considerable extent, be changed into gold, and the reserve for the redemption of rupees would have to bear the loss of converting rupees into gold. If we are going to do that we shall probably have to go on piling up the assets in the reserve for the redemption of rupees returning from circulation.

1297. Would that be economy or the proper thing to do?—Well, it is what has been done in the past. Until the last two or three years we have been crediting the interest on the securities in the gold standard reserve to the gold standard reserve itself.

1298. But that was only a temporary device—to credit these profits to revenue?—Yes, it was supposed to be temporary.

1299. Now speaking about the subsidiary silver coinage, you said it would be affected. Do you suggest any remedy for guarding against that?—If the gold standard has been introduced?

1300. Yes.—As I say, it is possible that you might reduce the fineness of your subsidiary coinage.

1301. You have no other suggestion?—Well, the use of rupee notes would help.

1302. (*Sir Maneckji Dadabhoy.*) May I draw your attention to paragraph 13 of your memorandum in which you discuss the method of meeting the demand for gold. There you sum up the situation thus: "In either case, the net result would be that the private imports of gold would, shortly after the introduction of the new system, be at least as large as under the present system, . . . The sterling reserves, however, would be used up in meeting the Home charges." Will you please let me know how this considerable dislodgment of silver will affect internal prices?

1303. (*Chairman.*) Might we take that a little later, Sir Maneckji, when we come to that paragraph?

1304. (*Sir Maneckji Dadabhoy.*) Just as you like, Sir. I am sorry I have not had the advantage of hearing Mr. Denning's previous examination, and I do not know whether I am going over the same ground.

1305. (*Chairman.*) Not at all; it is a most useful and interesting question, but it will come more neatly later. Mr. Denning, just to make it clear, you suggest that there would be a possibility of breakdown in Sir Basil Blackett's scheme if the percentage is not high enough. Equally there is the possibility of a breakdown in your scheme also?—There is, but it would not be a serious breakdown. Under Sir Basil's scheme the whole arrangement with the bank and the constitution of the bank reserve would go.

1306. It would be a breakdown of a more cast-iron scheme in that case, as I understand it.—I suggest that you can prevent a breakdown under my scheme by raising sterling credits. That is the only action you would have to take; my scheme remains the same except for that, whereas the whole of Sir Basil Blackett's scheme will break down.

1307. (*Mr. Preston.*) In paragraph 2 (D), the last sentence, you say—"In other words, when exchange drops to the lower gold point there is no automatic decrease in the currency. Had it not been for exchange such decrease would depend on the action of Government." Am I not correct in saying that the functioning of the gold standard reserve has always been held to be the primary source for maintaining exchange by meeting reverse council bills?—Yes, I think so.

1308. And then, Sir, would I be right in saying had Government correctly administered the gold standard reserve, would there not have been that immediate, effective, automatic contraction of currency we all so desire?—Well, that is a criticism of Government's policy in doing something else, and I think one would have to go into all the circumstances in which they decided not to have an automatic decrease in the currency.

1309. Well, perhaps I put the question rather awkwardly. What I want to ask is, had they followed the accepted rule, contraction would immediately have become effective?—If, as soon as they had sold reverse councils they had put a corresponding number of rupees into the gold standard reserve, contraction would have been effected.

1310. If we turn to a statement in the memorandum on "A Gold Standard for India" for the years 1906, 1907, 1908 and 1909, and taking 1908 really as the major one, in March, 1908, there was held in the Indian portion of the gold standard reserve silver to the extent of 4 millions sterling, which increased in September to 12 millions sterling. Now, that was silver which was actually taken out of the circulation, and it was held up in the gold standard portion of the gold standard reserve in India; so the currency was contracted to that extent?—My point is not that Government could not contract that currency, but they need not if they did not want to.

1311. But should they not have done it?—Possibly; but perhaps after an examination of the circumstances at that particular time they decided not to.

1312. That policy had been pursued in the four years from 1906-10, but has not been pursued since then?—I am not sure of that. I do not remember the circumstances properly, but I am not sure that that increase of rupees in gold standard reserve was entirely duo to the sale of reverse councils. I do not think those rupees were put in automatically as reverse councils were sold; I am not sure about it. I looked up the case of the sale of reverse councils in 1914-15 and I do know at that time Government borrowed from the gold standard reserve. They did not decrease the currency.

1313. They sold reverse councils to the extent of 8 millions sterling?—Yes.

1314. I think those figures are almost conclusive evidence that the equivalent in rupees of 8 millions sterling was set aside and earmarked in a separate reserve in India for the Indian portion of the gold standard reserve?—It was not done immediately. It may have been done afterwards. I have looked it up, and I am quite sure that to meet that demand they borrowed from the gold standard reserve. They may have put it in afterwards, but I am not sure.

1315. Well, according to these figures in 1908, there was the balance of silver held in India to the credit of gold standard reserve, which, if they had been silver, had been withdrawn from circulation?—Yes, I am not saying that they had not been withdrawn from circulation, but I say that it was not an automatic process as far as I know.

1316. Four millions sterling represented as far as my memory goes, the rupee portion of that reserve which was agreed to in old days. Then that would bear out what I said that in September, 1908, reverse councils were sold to the extent of 8 millions sterling, and sold so long as reverse councils are sold, you will agree, I think, that if the equivalent of legal currency is taken and set aside in a special fund forming part of that parent fund, that that is contracting?—I agree.

1317. Which is what we desire?—I agree to that. If that was provided by statute, then there would be an automatic decrease in the currency.

1318. (*Sir Purshotamdas Thakurdas.*) Regarding the amount of rupees which may be allowed to be legal tender, comparisons with other countries show that the amount you have indicated, viz., fifty rupees, is on the high side. But does the amount not also depend upon the banking habits of the people, and the facilities for changing into smaller denominations available in the country?—I do not quite see that.

1319. Suppose a man has 3 gold hars or gold coins or 2 currency notes for 100 rupees each, and he wants to change it into smaller denominations, I mean, he wants five-rupee notes, or one-rupee notes or one-rupee silver coin. The facilities for such change in

the country at the moment happen to be fairly small, the village sircar will charge a commission on changing bigger denomination notes or changing gold coins into the smaller subsidiary coins. In view of that, is it possible that you put the limit at Rs. 50?—I do not think that makes very much difference, because, assuming that the holder of a hundred-rupee note wanted to change that hundred-rupee note for smaller denominations, he could change it into five ten-rupee notes and the rest into rupees; he would only want rupees for the smaller transactions.

1320. But the very fact that he wants to change the hundred-rupee note into ten-rupee notes or into one fifty-rupee note, and the other 50 silver rupees, means that he will have to pay commission or discount in the major part of the country where the banking facilities are scarce; don't you think it necessary to keep the maximum amount of rupees as legal tender on the high side at the start?—I do not think that there is very much in that argument.

1321. Do you think that it would be also desirable to keep it on the high side in order to ensure that as few rupees as possible are returned for exchange in gold?—I am inclined to think that it would not make very much difference.

1322. If you had your legal tender limit, say, at 100 rupees, where people could hold that amount in hoards, they would not care at all, unless they really preferred gold to silver, they would not change from one coin to another, will they?—Now we will have to consider what he wants his rupees for.

1323. Simply because he is not accustomed to the habit of investing, and he likes gold better under the new circumstances. But if he allowed the period to lapse, he may not be able to use his hoard later for purposes of lending?—At any rate, if he ever wanted to get rid of it, all that he need do is to get rid of Rs. 30 at a time; that is, if the legal tender were only 50, he could get rid of the rupees at any time he wanted by handing them out in three blocks instead of in one. I do not see that it makes very much difference.

1324. If he had to lend them?—He has only got to go to two different places.

1325. I think in a part of your memorandum you say we will have to guard against the rush of rupees being changed into gold as soon as you put a gold coin into circulation. Till 1914 gold was available for circulation fairly easily without any restriction to those who wanted gold instead of silver?—Yes.

1326. There was no hesitation on the part of Government. Government gave out gold coin as readily as they gave silver coin?—They did up to 1914.

1327. Up to 1914? Up to the outbreak of war?—I think the issue of gold was stopped for some time, but it was started again as far as I remember between 1910 and 1914 and gold was sent out to outlying treasuries and offered freely.

1328. Up to the time of the war?—Yes.

1329. Can you tell us how many rupees were exchanged for gold when that facility was available?—All that one could give in figures would be the absorption of gold.

1330. (*Sir Purshotamdas Thakurdas.*) I have seen the total absorption of gold between 1910-11; I wonder if you could bring those figures up-to-date or tell me where these figures would be available.

1331. (*Sir Alexander Murray.*) They are in Appendix III to the historical review?—You get the figures of absorption of gold coins for 1924-25 in Appendix III to the historical memorandum.

1332. (*Sir Purshotamdas Thakurdas.*) Have you been giving out any gold coin at all lately?—No.

1333. Then how does the absorption of sovereigns and half-sovereigns come in 1923-24?—It is the import.

1334. But the import is not absorption; until you put it into circulation it is not absorption?—But it is there; it is in the hands of the public.

1335. You mean import on private account?—Yes.

1336. I was thinking more through the Currency Office?—We are not putting any through the Currency Office.

1337. What I wanted was those figures for circulation and the absorption of gold coin through the Currency Office.—I think it will be possible to obtain that.

1338.—That is why I said that this statement does not give the information; when Government were ready and prepared and did give out gold coin in exchange either for silver or for paper, how much did people take from the Government Currencies?—I think those figures could be obtained.

1339. I had seen the statement referred to by Sir Alexander, but I felt that it was not what I wanted. What I really want to know is what rush there will be for exchange of silver coin into gold when gold is offered by Government. I take it that you could get these figures for pre-war years without much inconvenience?—I think Mr. Aiyar could get those figures.

1340. Why do you think then, Mr. Denning, as I think you said in reply to Sir Maneckji Dadabhoy, or some other colleague of mine, why do you think that there would be an extraordinary rush for a new gold coin which may be introduced, say, within the next year or so?—I would not say that there will probably be an extraordinary rush; if it were announced that the full legal tender of the rupee were to be taken away, that would be the main cause of the rush.

1341. If you announce that the token rupee will not be full legal tender except to a certain point there may be rush?—Yes.

1342. If you did not interfere with the full legal capacity of the rupee, then, there would not be an extraordinary rush?—No, I do not think there would be any very extraordinary rush.

1343. There would be no more rush for the gold coin than there was before the year 1914?—No, I would not say that, because I think there has been a change in the habits of the people. I think they like gold very much better than before.

1344. Would you agree in the last three years they had got all the gold which they were thirsting for or that their hunger for gold has been mostly satisfied?—Partly yes.

1345. Gold rates have gone down fairly low, much lower than they have been at any time during the last 15 or 17 years; do you not think that that extraordinary thirst has been quenched?—I would not say it has, because the import of gold is still on a fairly large scale.

1346. Don't you feel that the demand has really fallen off from what it was really a year ago?—Certainly. But then last year's was an exceptional demand. The demand for the first seven months of the present financial year as against the first seven months of the last financial year shows a difference of seven crores. It is seven crores less.

1347. You would still not be inclined to say that for all practical purposes the people have very nearly been saturated with the gold they might have wanted?—No, I should hesitate very much to go as far as that.

1348. If the rates of gold went down they might take perhaps more?—I think they will go on taking more gold.

1349. Irrespective of a decline or rise?—Not irrespective. They will go on taking gold if it remains at its present price or goes lower. If gold became dearer they might not.

1350. (*Chairman.*) I would like to ask one or two questions arising out of those answers. As I understand it the actual tender of rupees to Government for gold has been blocked since the introduction of the two shillings ratio?—Yes, you mean the issue of sovereigns?

1351. Yes?—Yes.

1352. Do you happen to know what the bazzar price of gold is at the present moment?—I think it is about 22 rupees a tola.

1353. (*Sir Purshotamdas Thakurdas.*) It has been Rs. 21-5 or 21-6 a tola.

1354. (*Chairman.*) It works out to Rs. 13-6 a sovereign?—About that.

1355. (*Sir Reginald Mant.*) You said, if I understood you rightly, that your scheme provided for an automatic contraction of the currency, Government taking rupees from the Bank, and you said that Government would not be able to put those rupees back into circulation, because the Bank would not take them?—Yes.

1356. Could not Government theoretically use those rupees at its own Treasuries and pay them out?—Yes, but they would promptly come back to the Bank again, and then be presented by the Bank again, because their limit would be reached—50 crores.

1357. Until they came back to the Bank again, the currency would not be contracted?—They would come back at once, because the Bank would put them in their currency chests at their branches; and directly they went into a currency chest, the rupees in the bank's reserve would be excessive.

1358. But there are a certain number of Treasuries where there are no branches of the Bank?—But I assume that as a matter of convenience we shall hold currency chests at Treasuries on behalf of the bank.

1359. The Bank would put those rupees into the currency chests?—No, we should put them in ourselves to save our own balances.

1360. Theoretically, supposing you had a surplus of rupees unless you had an obligation to hold them apart from the Government. We are assuming balances—you could theoretically utilise them?—You could utilise them, but they would come back at once. The underlying assumption is that there is a return of rupees from circulation. If Government for their own direct payments to the public throw out more rupees, then they are only going to increase the amount that would come back.

1361. But during the process?—It would be a very short process. The two things would be almost simultaneous.

1362. Supposing Government sold those rupees, melted them down and sold them for gold, they could utilise the gold for currency, could they not, unless they were under a legal obligation to maintain the gold standard reserve at a minimum amount?—Then there would not be any contraction of currency? What I want to put to you is, I think you admitted it in reply to the Chairman, that unless there was the legal obligation on Government to maintain the reserve for the redemption of rupees at a minimum figure, there would be no automatic contraction of the currency?—I think it will be extraordinarily difficult for Government to make the arrangement. You now suggest that they should issue gold, and when the rupees come back from the Bank, Government would issue coin; they could not very well issue them in places where there is a branch of the Bank, as all the Government transactions are put through there.

1363. They could take the gold to the Bank and get notes for it?—Yes they could, but I am assuming that Government have to keep their reserves in cash.

1364. Then you are admitting my point?—Yes. I agree.

1365. You would have to impose a legal or moral obligation on Government to keep their reserve intact?—Yes, I agree there.

1366. You said, I think, in answer to the Chairman, that your main reason for advocating the introduction of a gold currency was the risk of the bullion value of the rupee exceeding its token value; is that correct?—Yes.

1367. At the present rate of 1s. 6d. I understand that silver would have to rise above 4s. an ounce before that risk became a practical one?—I think so.

1368. Do you consider that, short of a world cataclysm like the great war, there is any serious risk of silver rising above that rate?—I think there is a risk, apart from a world cataclysm; I do not pretend to know very much about the silver market, but it is possible to imagine a combination of circumstances, say a drop in the Mexican production of 40 million ounces owing to troubles in Mexico, and at the same time a very large demand in China, and possibly a further large demand in India. It seems to me that it is quite possible you might get a very large rise in prices. After all the Mexican production did drop by 40 million ounces in 1913-14.

1369. You could get a sufficient margin of safety by fixing the exchange value on a high level if you put the token value high enough.—You get a larger margin of safety.

1370. So that really your preference for a gold currency is due to your objection to raising the exchange value of the rupee?—Oh no. However much you raise the exchange value of the rupee, there is always a certain element of risk.

1371. Owing to the possibility of a rise in price of silver?—Yes.

1372. (*Sir Alexander Murray.*) Arising out of Mr. Denning's answers to Mr. Preston regarding paragraph 2 (D) of his memorandum on a gold standard for India, regarding the sale of reverse councils resulting in the contraction of currency, would it be possible for Mr. Denning to give the Commission a short note explaining the occasions on which reverse councils were sold and what the practice adopted then actually was as regards the contraction of currency. They were sold in the years 1908-09-10 and in 1915-16, and again after the war.

1373. (*Chairman.*) That would be in amplification of the historical memorandum dealing with the years in which reverse councils were sold, and bringing out what course was pursued as regards the contraction of currency and what effect that course has had.

1374. (*Sir Alexander Murray.*) Yes, and, if it is possible, what were the immediate causes that induced Government to depart from the theoretical idea of contracting currency when reverse councils were sold.

1375. (*Chairman.*) Would it be possible, Mr. Denning, to have that prepared as an amplification of the historical memorandum?—Yes, I think so.

1376. (*Chairman.*) I think that would be of service to the Commission.

1377. (*Sir Norcot Warren.*) Assuming that gold currency is introduced, will the fact that Government issued gold on two previous occasions and then withdrew the privilege have any effect on the first rush for gold? Would you think that people would try and get all the gold they could at the start?—I think it is possible.

1378. (*Chairman.*) Continuing your memorandum, we come next to a closer consideration of what is said there as regards the gold standard, and if the questions are all directed to testing your conclusions it, of course, does not follow that any particular point of view is assumed by the questioner. I come to paragraph 8 of your memorandum, in which you say:—"Undoubtedly, the ideal to be aimed at is the system now in force in Great Britain under which the note is the sole full legal tender in circulation, and the gold value of sterling is stabilised by the statutory obligation imposed on the Bank of England to buy and sell gold at rates corresponding roughly to the par of exchange," and so forth. Now, assuming the ideal, will you tell us whether in your opinion it will serve to advance that ideal that there should be an intermediate period of the gold standard system during which the people would become accustomed to the right to a gold currency?—Yes, I think it will advance the attainment of that ideal. I think

it will tend to popularise notes if they are convertible into gold. If you popularise notes you tend to reduce the use of metallic currency.

1379. Is it not the experience of other countries that the right to a gold circulation, once it has been secured, is one which it is very difficult to induce a population to part with?—I am trying to think of countries in which such action has been taken.

1380. To make my point clear, let me instance the case of Great Britain before the war, where there was a partial gold circulation. Could you imagine any convulsion less enormous than that of the Great War which would have induced Great Britain to leave this gold standard and to assume a strict exchange standard such as that to which you refer here as the ultimate ideal?—Well, I think it is possible that there would be a certain section of the people who would object strongly to parting with their gold. But you have, on the other hand, the example of the United States of America, where gold was in circulation at one time and had practically ceased to circulate before the war. It is rather difficult to judge the case of Great Britain. You have on the other side the factor that the people are perfectly satisfied with the notes now.

1381. But it took the abnormal experiences of the Great War in order to teach them?—I think it would be extremely difficult to stop suddenly the issue of gold coin, but I do think it is reasonable to believe that, if you have a note of sufficiently low denomination which can be substituted for gold, the use of notes might grow. The trouble in Great Britain was that there was no note of a denomination below £5. It was too large a unit.

1382. I will put it finally in this way. Might it not seem somewhat contradictory that, in order to accustom people to the use of inconvertible notes, you must in the first place accustom them to the use of gold?—At first sight, it does seem a little contradictory.

1383. Nevertheless, I understand you are of opinion that, under Indian conditions, that is a necessary preliminary to accustoming people to an inconvertible note?—I think it would hasten the attainment of the ideal—I think it would be a slower process if you kept the present system.

1384. Do you consider that the process by which the population accustoms itself to the use of the ideal internal currency of the inconvertible note is a process which is now going on in India, as evidenced by, for instance, the increase in the note circulation?—I think that the use of notes is undoubtedly increasing.

1385. Do you think that, within a reasonable time and during the intermediate period, by the increase of facilities for the encashment of notes and by the increase in the facilities for obtaining small notes, what you describe here as the ultimate ideal might not be obtained without the intervening period of a gold standard?—I think it would be a very long period.

1386. It is a question I hesitate to ask, but at the present rate of progress how long do you think it would take?—Well, I would not care to say anything more exact than many generations.

1387. Are you of opinion that it is possible that the increased facilities for the circulation of gold might tend to immediately displace notes from circulation?—I think there might be a certain amount of displacement—at first at any rate.

1388. Would that be an extensive displacement in your opinion?—No, I don't think that the displacement in the circulating media would be very extensive.

1389. What makes you think that it would be temporary, and that the process would be reversed and would not be continuous?—People might, having not been able to obtain gold for some time, like it as a new toy, so to speak. And after a time, they might give up the use of it as being less convenient than notes.

1390. Then it is your view, as I understand it, that in the course of time the population would learn to be content with the right and the possibility of obtaining gold, and the confidence that would give in the note issue would lead them not to make use of the right, but to use the note?—I think so, yes.

1391. Might not that same object be served and accelerated, so as to reduce that period of many generations to which you have referred, by increased confidence in the ultimate gold value of the rupee as expressed by its exchange value?—It might to some extent, if you could give that confidence, but I am afraid it would be a little difficult to give that confidence after the fluctuations in the exchange value of the rupee in recent years.

1392. Would that confidence not be given by the adoption of a perfected exchange standard which worked automatically, independently of Government control, and exhibited a stabilised rupee?—The confidence might grow gradually, but I doubt if it would be there at first. When the system had been working for many years and it had shown that it did definitely establish the value of the rupee, the confidence might grow.

1393. Would not there be this difference from the previous state of affairs, that then the working of the system was not automatic; it was subject to Government manipulation?—Quite.

1394. Under such schemes as we have been outlining the system would be automatic and would be removed from Government manipulation. Might not that tend to accelerate the growth of confidence?—It would tend to, I agree.

1395. Finally, under this heading, I understood you to say in a previous reply that the demand of the public for gold is being satisfied but is still substantial?—Yes.

1396. By the continuance of the processes now at work, might we or might we not look forward to a period in which the demand of the public for gold, for instance, for the replacement of silver in hoards, would be satisfied by these natural processes, and thus a state of affairs would be achieved by natural processes which you propose to achieve by the adoption of the gold standard?—I think that, as long as the rupee remains full legal tender, a large portion of the hoards of the country will be maintained in rupees, and there will always be a potential demand for gold which remains unsatisfied.

1397. You are not of opinion that, by a continuance of the present processes, the hoards of the country will be in time converted from silver into gold as long as the rupee remains unlimited legal tender?—No, they may be replaced partially but not entirely.

1398. (*Sir Purshotamdas Thakurdas.*) With reference to the question from the Chairman regarding the exchange value of the rupee being more stable leading to better confidence in the rupee, would the exchange value of the rupee if stable be known to the masses and would they be concerned with it at all?—It would be known in the course of time, if it remains stable. It would not be known to them at once.

1399. Would they know it at any stage when it could be of practical use in the consideration of confidence of the part of the masses. Do you think the masses are aware that the rupee was at 2 shillings in 1920, and went down to 1s. 4d. after that, and to-day stands at 1s. 6d.?—I think there was a considerable amount of confidence in the masses in the exchange value of the rupee in 1913, when it had been stable for a matter of 13 or 14 years. But that confidence has been destroyed to a large extent by the events since 1914 and it would take some time to build it up again. It might be built up again in the course of 15 or 20 years.

1400. But you do think that the masses do follow the fluctuations in the exchange value of the rupee

with intelligence?—I don't know that they follow the course of the rupee sterling exchange.

1401. Or are at all in touch with the exchange value of the rupee?—No, but I think they know after a comparatively short time if it varies.

1402. They do?—Yes.

1403. Therefore, irrespective of the bullion value of the rupee this would affect the confidence of the masses—I mean the exchange fluctuations in the rupee would affect the confidence of the masses in the rupee. That is your opinion?—I think the recent exchange fluctuations have affected the confidence of the masses.

1404. (*Sir Reginald Mant.*) Mr. Denning, you said just now that gold would only partially replace rupees in hoards. The replacement is taking place at present at rather a rapid rate. Is it not?—As far as I can judge, it is.

1405. Judging from the imports of gold—there were 73 crores, imported in 1924-25 and from a slackening in the absorption of rupees, don't those two factors point to a very rapid substitution of gold for rupees?—I would not say it is very rapid. I should say it is going on, but it is difficult to say how rapid it is. The decrease in the absorption of rupees was from 762 crores in 1923-24 to 365 crores in 1924-25. It is not a very large decrease.

1406. What would you put the normal absorption of rupees at? We have not got any pre-war average here?—I can give you the average for the five years from 1909-10 to 1913-14; it was 8 crores 77 lakhs.

1407. The average was 8 crores and last year after at least three good monsoons the absorption was only 365 lakhs and also you had withdrawn the one-rupee note. Does not that point to a considerable decrease in the rate of absorption of rupees?—A considerable decrease. But it must be remembered that there was a special factor operating, namely, the extraordinary cheapness of gold relative to the pre-war price.

1408. But the substitution took place?—Yes. I agree that a considerable substitution did take place.

1409. (*Sir Henry Strakosch.*) Mr. Denning, you told us that you thought that if you gave the people gold, they would regard it as a toy and would prefer it at first and that you could afterwards take it away from them. How long would you think they would want to play with that toy and how long would it be before you could take it away from them?—My remark about a toy referred to the use of gold for circulation purpose. It is rather difficult to say how long they would want that toy.

1410. I want to get at the point which is of very great importance: when the people get habituated to the use of credit instruments including notes and to weigh which system is preferable, one should always remember that violent changes in all currency matters are very detrimental to the internal economy of a country. You said that it would take generations to get people habituated to accept the things under the present rate of progress. I should like to be able to weigh one against the other and to estimate the period which will have to elapse under the one and under the other system; and for that reason I ask you how long you think they would want to play with the toy and then be ready to give it up?—I am afraid it is a little difficult to assign any definite period. All that I can say is, I think it will be a shorter period.

1411. Suppose you let them play for ten years; would it be enough?—I should say that for a great number of people it would be enough; but for others it would not. I should say the use of the toy will gradually decrease.

1412. I suppose you would regard violent changes in prices as a serious defect of a system of currency. What I have in mind is this. If it is true the introduction of gold as currency in this country would appreciate the price of gold, that is to say, press down commodity prices and at the same time heavily depreciate the price of silver which is the substance in which a great part of the population has invested its savings, would you regard that as a thing to be avoided?—I would certainly regard it as a thing to be avoided if the adoption of a gold standard is going to mean a large movement in prices generally.

1413. And would you prefer a system which is less likely to lead to violent changes in prices?—Certainly.

1414. (*Sir Maneckji Dadabhoy.*) You said that the use of notes is unduly increasing. This increase in the use of notes was marked during the Great War only at the commencement; was it not?—I would say the increase arose mainly during the war; but the large increase that took place during the war has still continued.

1415. On the same scale?—I think so; if you would look at the figures of the note circulation, it is about the same scale.

1416. Then you think that they would be popular?—I think they are increasingly becoming popular.

1417. But at the outset of course these notes were converted for very heavy discounts, you know.—Yes, they were, the one-rupee note especially, when it was first introduced.

1418. And not those of other denominations?—Yes; at that time there was no silver available.

1419. That is why heavy discount was taken?—Yes.

1420. Is it not a fact that even now in the districts and in rural parts notes are not cashed without a discount?—I believe there is a discount, which really amounts to a money changer's commission. I do not think it is more than that.

1421. You will also admit that despite any change a large percentage of the hoarded wealth will continue to remain in silver?—I think some of it might.

1422. What will become of that part of silver which remains in ornaments: will that be melted?—No.

1423. A large percentage in the country is in the shape of ornaments; what will happen to that?—That would remain as it is, probably.

1424. You said about popularising these notes—in answer to a question by the Chairman—that you have to replace notes of lower denominations: what do you mean by notes of lower denominations?—I think that was a reference to there being no notes of low denominations in Great Britain; but personally as I said on Friday, when I think you were absent, I am in favour of re-issuing the one-rupee note.

1425. Would it be a very economic thing to re-issue one-rupee notes?—I think in the end it would cost about the same as the issue of the rupees, assuming that you have no special store of rupees to draw upon.

1426. (*Prof. Coyajee.*) As regards the giving up of the gold currency toy, can we draw some light from the case of Egypt which is very similar to that of India? They had gold currency for decades. Is there any reason for their giving it up?—I believe they had to give it up during the war; did they not? I do not know what is the currency in circulation in Egypt at present.

1427. They have been systematically drawing gold; of course they have been sending it back. In the crop season they draw it from England and they send it back later on. There was no giving it up. You told the Chairman that with the advent of the gold currency, gold will tend to displace notes to a certain extent?—Yes, I thing so.

1428. And the holders of silver ornaments will have this as their channel for changing their metal into gold; they will try and get their silver and get notes and present them for gold? Is not that likely?—I should not think so because the price of silver would presumably be low and I do not think they would be inclined to sell their silver ornaments,

1429. Don't you foresee that it might get lower as silver is sold abroad and therefore they might be keen on exchange?—That is a question of their appreciation of the movements in the silver market.

1430. (*Chairman.*) Continuing the memorandum, paragraph 11 says:—"(*a*) the total amount of rupees presented by the public for conversion would not appreciably exceed Rs. 100 crores." This, we agree, is the vital figure of the calculations involved in the introduction of a gold standard. It is, of course, a hypothetical figure, is it not?—Entirely; it is an estimate.

1431. I see that Sir Basil Blackett in paragraph 21 of his memorandum inclines to the view that 200 crores of silver rupees is an overestimate of the amount to be converted into gold and he suggests a figure of Rs. 150 crores, which means that it reduces the amount which will be presented through hoards by 50 crores. What, in your opinion, is the relative reliability of the two estimates?—Personally I am inclined to favour the estimate of 200 crores. It may be a little on the safe side. But I should not care to proceed on the assumption that the amount would be as low as 150.

1432. As to the 90 crores of silver rupees in the reserve, would you explain what you mean by the phrase 'valued at one rupee per standard tola'? That refers, as I understand it, to silver bullion—the present valuation in the accounts?—The present valuation for the purposes of the paper currency reserve accounts. Previous to the war the valuation of the bullion was the purchase price. After the war there were considerable difficulties in adjustment and the small holding of silver bullion at that time was definitely valued at one rupee per standard tola. Thereafter the accretions to the silver bullion have come from the melting of uncurrent coin, and in accordance with the Indian Paper Currency Act the silver obtained from uncurrent coin is credited to the reserve at the rate of Re. 1 per tola.

1433. We have dealt at some length already with the basis of this estimate of 100 crores. May I remind you that we hope to obtain a memorandum from your Department setting out the best bases which can be given as to the total amount of rupees in circulation, in hoards and so forth?—Yes, Mr. McWatters mentioned it to me this morning.

1434. In sub-paragraph (*b*) we get your estimate of the amount to be realized by the sale of the silver returned and the silver in the reserve, and the estimate is based on an average price to be obtained of not less than 24*d.*, per standard ounce. Can you tell us what led you to adopt the figure of 24*d*? —Any figure of that nature must to a large extent be a guess and one has to proceed on very general considerations. We have the fact that the lowest price of silver during the last century was 21*d.* per standard ounce. Gold prices generally have increased by 50 to 60 per cent. If the price of silver falls to a very large extent relatively to other commodities, then its uses for industrial purposes, subsidiary coinage and the like would probably increase and bring in factors which would tend to keep the price up. That is one general consideration. Another general consideration is that between 1922 and 1923 the world production of silver increased by 32 million ounces. This considerable increase in production did not appreciably affect the price; in fact there has been a tendency for it to rise rather than to fall. Looking for analogies, the nearest seems to be the sale of German silver in the seventies. At that time Germany sold one-and-a-half year's world production of silver and the price fell by 9*d.* The sales were spread over a period of nine years and the price fell 9*d.* during these seven years but there were other factors affecting the price of silver which tended to force it down.

1435. Do you remember what the price was at the outset when those sales began?—I think about 53*d.* Then we have the fact that the United States between June 1920 and March 1923 purchased 187 million fine ounces. Thus for three years there was a demand of about 60 million ounces per year on account of the United States purchases. This demand was removed from the market in March 1923. The removal of this demand did not affect prices appreciably. All one can say is that the factors in the silver market are uncertain and that it is difficult to give any definite figure, but there is reason to suppose that there are factors that may intervene to prevent what at first sight appear to be the staggering effects of these large sales of silver.

1436. You are assuming in this estimate that the sales are under control and spread over 10 years?—Yes.

1437. Supposing there was to be a great acceleration of the selling, either by the tender of hoards for gold through private channels, or by the sale of silver ornaments and other forms of silver as a result of the announcement of this policy, would that introduce a factor which might tend to falsify this estimate?—If such an event occurred it would, but such an event is, I think, not very probable.

1438. Would you amplify your reasons a little for viewing that as an improbable event?—Well it seems to me that the principal effect of an announcement that India was going to sell this amount of silver spread over ten years would be a large drop in the prices of silver straightaway, and the holders of silver ornaments would not be very much inclined to realize, because they would lose, and if they looked ahead they would say that this extraordinary excess of silver on the market would be removed again after ten years.

1439. Is it not a general experience of markets that a sharp fall produces a panic amongst holders, which results in wholesale selling at any price obtainable? —It does sometimes, but if that silver is in the form of ornaments, it is being definitely used; and it is a question whether ornaments would be melted down.

1440. (*Sir Reginald Mant.*) What is the equivalent of a dollar per fine ounce in pence? Can you give us that, roughly? The American purchase was at a dollar per fine ounce?—I am afraid I cannot say off-hand what the equivalent is.

1441. I only want to check your statement from these tables that there had not been any material fall in prices when America ceased purchasing?—I can give you the prices of silver in cents.

In 1921-22 the highest price in cents during the year was 73, lowest price 56;

In 1922-23, the highest price was 74, lowest 62;

In 1923-24, the highest price was 68, lowest 63; and

In 1924-25, the highest price was 72, lowest 63.

1442. When did they cease purchasing?—In March, 1923.

1443. We were told the other day that silver is produced mainly as a bye-product.—I believe so. According to the experts' report, which is an appendix to the Babington-Smith Committee's Report, about 80 per cent. of the world's production is a bye-product from ores which are primarily worked for lead, copper, zinc, and gold.

1444. Can you tell us whether that was the position of affairs in 1870 when Germany put a large amount of silver on the market?—I am afraid I cannot.

1445. If silver at that time was produced largely on account of its own value, the action of Germany then would probably check production, and that might account to some extent for the small drop in prices.—I can tell you that the world production was increasing, but whether this cause was operating, I do not know.

1446. So under present conditions in which silver is produced largely as a bye-product, you cannot expect a large decrease in production even though the Government of India were to make a large addition to the supply?—Not so large; but you can presuppose some decrease in production.

1447. If the addition to the supply will not affect a corresponding decrease in production, prices may fall very low, much lower than you anticipate?—I think they may. I do not pretend that my estimate is necessarily correct. I think further expert advice will have to be taken.

1448. (*Chairman.*) Now we come to paragraph 6, which raises the important matter of the reserves to be held during the intermediate period. There the effect is this, is it not, that you start at present with a total of gold and sterling of 109·7 crores to cover the note issue and the exchange reserve, and you propose that during the intermediate period you should hold only 56·9 crores?—That is correct.

1449. That is for both these purposes, as cover for the internal convertibility of the note issue, and as an exchange reserve for stabilization of the rupee?—Yes.

1450. Are you of opinion that, in view of the circumstances that the country will be passing through an experimental period as regards its currency in which the basis adopted depends upon many uncertain hypotheses which cannot be exactly calculated, a reduction of your gold and sterling securities to 56·9 crores as a cover for the purposes described is a measure of prudence, leaving a safe margin?—I would say it would be imprudent if you did not have behind you a backing of external credits or the possibility of getting external credits.

1451. Those external credits are credits used for what purpose?—Those external credits that you actually take would be used for providing the necessary gold to convert rupees into gold.

1452. Or rather thay can be used directly, according to your scheme, to avoid the necessity for remittance and thus to force an increased import of gold through normal channels?—Quite.

1453. You feel no doubt or hesitation about the reduction of the percentage to 30 per cent. from the present percentage during this intermediate period?—I do not think so. The 30 per cent. backing would appear to be sufficient, if you had the further backing of external credits which would be drawn upon as required.

1454. Any further extension of those external credits, as I understand it, would be an increase in the expense of the scheme?—Yes, but I do not know how far it would mean an increase in the expense. What I mean to say is that might we make an arrangement under which we might take a credit of 50 crores; we should have the drawing power, we will say, of 50 crores, but in practice we might only take 25 crores. The expense of obtaining that drawing power of 50 crores would not be so great as the actual taking of the remaining 25 crores. It is the expense of obtaining an option.

1455. (*Sir Henry Strakosch.*) I want to ask Mr. Denning what the difference is between a reserve and credits abroad. I understood you to say that a 30 per cent. reserve would be imprudently low unless facilities to raise credits abroad were assured. Could not one more simply express that by saying that a 30 per cent. reserve is not adequate? Leaving aside the question of cost, you are saying that a 30 per cent. reserve would be too low unless credits were available. Could not that be equally expressed by saying the reserve ought to be, for argument's sake let us say, 50 per cent.; you might feel safe with a reserve of 50 per cent.?—I do not think it is quite the same thing. After all, the reserve you want, assuming you are going to keep a definite amount and assuming that it is not going to be drawn on, is largely to give confidence.

1456. Let me put it to you this way. Simply as an example let us take a reserve of 30 per cent. and a drawing power of 50 crores. Very well, then the 50 crores, if you had them in sterling or dollar securities might yield you, say, a matter of 4 per cent. Now if instead of having your 50 crores of securities, you had a drawing power of 50 crores for which you will no doubt have to pay a commission, and on top of that in respect of any amount drawn the current rate of interest which would no doubt be higher than 4 per cent. I do not quite see why there should be any particular advantage from the expense point of view in not holding these reserves but to arrange for a credit?—That would depend on the rates, the rate of commission you would have to pay for the drawing power and the rate of interest you would have to pay on the amount you might draw; that would be a matter of calculation.

1457. But unless you could raise the 50 crores cheaper than 4 per cent. it would pay you to hold the reserve?—It depends on interest rates.

1458. Yes, I had assumed for the purpose of the argument that a reserve of 50 crores could be invested at an average rate of 4 per cent.—That is assuming you intend to borrow the whole definitely. In the first place, you have to decide what commission you would have to pay on the drawing power of 50 crores and you would have to pay that all through the process. Then you would actually draw, say, 30 crores. Therefore on the 30 crores you would pay the full rate of interest during the time you would have that money, that is, at the current rates; but on the remaining 20 crores you would only pay your commission.

1459. Therefore, may I take it that your proposal with regard to raising credits abroad is made merely to save expense, and that if you had the possibility of holding that amount in reserve you would do so?—Oh, yes, it is intended to save expense.

1460. Therefore, I think you admit that 30 per cent. is inadequate and if you had the means you would make it a higher percentage of reserve?—Yes, I would have a higher percentage of reserve if I had the means. I say you can substitute for the time being an external credit.

1461. (*Sir Maneckji Dadabhoy.*) I want to make clear just this point which I could not follow. You say that Government could permit this backing to go as low as 30 per cent. merely because there is further backing of external credit?—Yes.

1462. If there was not this backing of external credit, then Government would not permit it?—I do not think so.

1463. Now can you always depend upon external credit?—I am assuming that you have arranged your external credit before starting your proceedings.

1464. There is an element of risk about it, is not there?—No risk if you have definitely arranged your external credit.

1465. (*Chairman.*) There is an element of uncertainty as to whether you could obtain the external credit?

1466. (*Sir Maneckji Dadabhoy.*) Quite?—Yes, there is that element of uncertainty.

1467. (*Chairman.*) Then you continue in your memorandum to deal with the reserves under the third stage, *i.e.*, the final stage. You outline a reserve which will consist of 56·9 crores of gold and 37·9 crores of sterling securities. Sir Basil Blackett in his memorandum suggests a reduction of those figures which would give us 40 crores and 39·5 crores of sterling securities or gold. Will you tell us whether, after considering Sir Basil Blackett's suggestions, you desire to modify your views as to the original proposal?—No, I cannot say I do, because that point was put forward by Sir Basil Blackett in a preliminary discussion and I maintained that it would be very much safer to allow for the minimum of 50 per cent. of gold and sterling and 30 per cent. gold. I still think it would be safer.

1468. Is that the result of a general view or of any detailed calculation?—It is the result of a general view. The main point is that I think in a country like India you want rather higher real reserves than in a country where credit facilities and education are further developed.

1469. On the question of the alternative proposals as to the holdings in the reserves under the gold standard system, are there any supplementary questions? If not, then we come to the next paragraph, on which there is only one question I would like to ask you in order to supplement our knowledge. You refer to the possibility of postponing, by special arrangements, the conversion of large hoards of rupees held by the Indian States. In the first place, are there any figures available as to the extent of these particular holdings of rupee hoards to which you refer? —None at all. It is impossible to obtain any reliable information at all.

1470. What is the nature of the special arrangements which you have in mind?—Negotiations, with the Indian States concerned of which the net result would be that Government would induce them to hold up their demand. If you gave them a definite promise of giving them gold in exchange for their rupees at some time in the future, two or three years hence, you might get them to agree not to put in their hoards at once.

1471. What will the inducement be to the holder not to put in his hoard at once?—Well, largely to oblige the Supreme Government.

1472 On the basis of an arrangement under which there was no inducement offered at all?—Well, one might possibly induce them by giving them a small gain on the proceeding. But I think it will be possible to induce them without anything of that sort, in some cases at any rate.

1473. Finally at the end of the paragraph we come to another very essential figure, where you say that the aggregate amount of the first demand would not be very large and a stock of 50 crores of gold in Bombay would almost certainly be sufficient. I understand you are estimating that, of the 100 crores supposed to be held in hoards, not more than half would be presented for conversion on the initiation of the policy?—Yes, that is my assumption, during the first rush.

1474. Can you give us any basis at all for the estimate of 50 crores,—As I pointed out there is no essential difference between the conditions that are in force now and the conditions which would obtain at the initiation of stage I, except the psychological effect of the announcement that the full legal tender attribute of the rupee was to be taken away some years afterwards.

1475. May I ask you a question on that point. I suppose it will be the intention of the Government to make a full announcement at the outset as to the policy to be pursued?—I think so.

1476. And not to exercise any reservation in what is to be told to the public?—I do not think so. The only difference would be that Government would have to declare their intention to take away the full legal tender of the rupee ten years hence; I do not think that that announcement in itself, without any other change in conditions, would lead to a very large immediate rush for the conversion of the hoards into gold bullion.

1477. Let me put it the other way about. Why should anybody wait?—In considering that I think that one has to remember that it will take a long time for the knowledge to filter down; it will take a long time for the rupees to come in from the villages for conversion; and the Indian mind, that is the mass mind, moves rather slowly; so that, I think it is extremely unlikely that you will get gold pouring in very vast quantities in a very short time.

1478. (*Sir Maneckji Dadabhoy.*) You referred to these hoards of rupees held by Indian States and you say "the conversion of which it should be possible to postpone by special arrangements." Do you seriously believe that the Indian States will disclose their reserves to the Government of India?—I do not think they will disclose them.

1479. How would you force them to disclose them? —I should not force them to disclose the amount of their reserves; all I should do would be to ask the States not to convert their hoards immediately; I should not ask them to tell me the amount of their hoards.

1480. Besides British rupees most of these hoards also consist of their own silver coin?—I do not think that would affect our arrangements except in so far as that money was legal tender in British India.

1481. But would it not affect it if they melt it down?—The Government of India would not have to give gold for it.

1482. (*Chairman.*) In paragraph 13 of your memorandum you deal with some of the mechanism that would be required to work out the proposal. You say:—"Assuming stage (1) were introduced at a time when there was a considerable balance of trade in India's favour and Government made no remittances at all to meet Home charges from the sterling reserves, the rate of exchange would promptly go to the upper gold point and the Exchange Banks would have to import gold to cover their purchases of sterling." Conversely, what would be the effect upon the operations described in this paragraph, supposing that unfortunately they were to coincide with a bad year for exports and there was a balance in another direction?—Normally there is never a balance in the other direction. There is always a balance of trade in India's favour, leaving out the Government remittances. The effect, if the season were bad, would be to decrease that balance.

1483. The question was, perhaps, badly put. Supposing that the introduction of stage (I) were to be coincident with a year in which there was an abnormal reduction of the so-called favourable balance of trade, of the nature that previous arrangements led to a situation which required the sale of reverse councils, what would be the effect upon the operations described in this paragraph of such a coincidence?—The effect would be that the amount of gold imported to liquidate the balance of trade would be less, and it is possible that Government might have to import gold on their own account to supplement the supply brought in through the ordinary channels.

1484. Increasing to that extent the amount of the credits obtained?—Yes.

1485. And increasing proportionately the expense of the process?—Certainly.

1486. Taking things at their worst, a series of bad years might possibly lead to such a prospective expense as to make the scheme prohibitive?—I would say that it seems unlikely judging by past history.

1487. Testing all the possibilities, that would be the effect of a series of years?—It would be the effect, yes.

1488. (*Sir Maneckji Dadabhoy.*) First in connection with the question the Chairman asked you, you have stated that Government will have to import gold on their own account; you also said that in either case the net result would be that the private imports of gold would, shortly after the introduction of the new system, be at least as large as under the present system. So would there be competition between the Government price and the private import price?—I imagine that Government would sell gold at parity and as exchange would be at the upper gold point the bullion merchant would sell it at the same price.

1489. You don't think there would be any competition?—I don't think so.

1490. You don't think it would be necessary to allow for restricting import under licence?—No.

1491. It won't entail that, as was done during the war?—No.

1492. You feel quite confident on that point?—Yes.

1493. Then, the next point I would like to know is in connection with this heavy dislodgment of silver. How will it affect internal prices of commodities? Will it affect it at all?—Well, at the first stage, silver will be only coming in from hoards and therefore I don't think it would have any effect. The amount of currency in actual circulation would remain the same.

1494. That is at the first stage?—Yes.

1495. But when a certain amount of absorption has taken place, what will happen?—At the second stage gold would be substituted for rupees. There will

again be no change in the actual amount of the currency in circulation.

1496. In none of the stages will internal prices be affected?—No.

1497. Will it affect wages?—If it does not affect prices, I don't see why it should affect wages.

1498. (*Sir Alexander Murray.*) In connection with Mr. Denning's reply to Sir Maneckji, he makes no particular reference to the fact that 18 to 20 crores of silver will no longer be imported at that stage.—If Government sell?

1499. The imports last year were 20 crores. Well, that silver will not be coming in to balance trade.—Why not?

1500. Because you will be selling silver in India to meet all requirements.—Yes, well?

1501. Therefore those 18 to 20 crores silver will not be coming in, which means that there will be increased supplies of gold coming in. Last year's imports of gold were 74 crores in value. Add instead of silver, 20 crores, and against the Government remittances 46 crores, so that roughly we will say the imports may be 140 crores.—That is assuming that Government make no remittances at all.

1502. Which is a natural assumption to make in the first year.—I imagine the amount of the Government remittances will be decided by the state of the Government's gold reserve. If Government found that so much gold was being imported that it was being presented to them, they would step into the market and start making remittances, because they would see that the demand for gold was being more than satisfied.

1503. I am in fact accepting your own assumption in this part of your statement.—I quite agree with you. All I say is that Government *could* force. I don't say they would. The state of affairs would be that gold would come pouring in. In so far as that gold was not required to meet the public demand for gold it would be put into the Government reserves. If Government found gold coming into their reserves, they would know that the imports of gold were more than sufficient to meet the demand and therefore they could safely remit without producing a demand on their own gold reserves.

1504. (*Chairman.*) In the next paragraph there is a slight difficulty which I think is only a conversion difficulty. In paragraph 14 you allow for the conversion of 20 crores of the sterling reserves into gold to meet the first demand; and at the conclusion of the preceding paragraph you say the sterling reserves would be used up in meeting the home charges. At the conclusion of the first paragraph the sterling reserves, that is the sterling reserves less the 20 crores, are converted into gold. Is that the case?—Yes.

1505. In paragraph 15 you describe how the reserves are reaccumulated by the sale of silver until they arrive at the figure for which you allow in your constitution of the final reserve. The next paragraph, paragraph 16, suggests the following question:—You are assuming, for the safe introduction of the final stage, that stage (2), during which there will have been a voluntary undertaking on the part of the Government to give gold coin against silver rupees, shall be in operation for a period of under five years, and that the voluntary offer on the part of Government will have been taken considerable advantage of, thus diminishing the shock which might otherwise be experienced by the reserves at the inception of stage (3). One must, therefore, contemplate, must not one, that, supposing stage (2) were to turn out not to have the effect which you expect from it, that is, a gradual substitution of gold for silver in hoards, that the date at which it would be safe to introduce stage (3) might be postponed accordingly. To put it crudely, you are allowing for a good long effective (2) before you can get on to stage (3) and you must have it?—I think it is safer to have it. But I think that if you make gold freely available and if, as you suggest, the people do not take advantage of it, then they are not likely to take any more advantage of it if you undertake an obligation to do what you have been doing in practice.

1506. The extent to which they take advantage of it does not seem to be to effect the possible extent of the demand at the inception of stage (3).—It might to a certain extent but not very much.

1507. One has to contemplate all possibilities. How would the matter stand supposing stage (2) were not to be taken advantage of at all and stage (3) were to be introduced and still there was no demand for gold in exchange for rupees in hoards?—If at the introduction of stage (3) there were still no demand.

1508. If nothing still happens?—Well, then, I think, you would have to go on piling your gold reserves to a much larger extent before you could introduce stage (4). I have assumed during the stages (2) and (3) a large amount of gold would be taken from Government. Instead of pouring out that gold, you will pile it up, so that you would be in a better position to meet stage (4).

1509. At no more expense. Now you arrive at stage (4) with your reserves piled up as you describe. It might be interesting to contemplate what would happen supposing you introduced stage (4) and still the people in India did not respond to the policy as to limiting the legal tender of the rupee, and there was no great alteration in the amount of silver held in hoards?—If there were no response at stage (4) then you could after waiting some time and obtaining no response reduce your gold reserves safely. If it didn't come at the initiation of stage (4) probably it would never come.

1510. I must admit that it is somewhat of an extravagent hypothesis, but it may serve to elucidate all possibilities, as I understand. What would then occur? You would have accumulated a big reserve which you might not be able to reduce. You would have been involved in a certain amount of expense which, as I imagine, you would say was not wasted because it has enabled you to undertake the transition to the inconvertibility of the rupee in safety, so you would say that you were as well off as if the matter had proceeded in the way in which you anticipated?—Yes.

1511. (*Chairman.*) We go on next to the question of the amount of gold required, and that is a question which we might conveniently adjourn until after lunch.

(*Adjourned for Lunch.*)

1512. (*Chairman.*) Mr. Denning, the total amount of gold required after the initiation of your third stage is for the substitution of rupees. First of all you give the figure of 110 crores of rupees. How does that come up to 110 crores instead of 100?—I said in paragraph 11 (*a*) that the total amount of rupees presented by the public for conversion into gold would not appreciably exceed 100 crores. Then I take 90 crores as being in the paper currency reserve and in order to round off the figures, I take 110 crores as the amount presented by the public.

1513. *Plus* 56·9 crores of reserve, less 29·7 at present in reserve, giving you a balance of 137·2 crores, approximately equal to 103 millions sterling? Now that is the absolute drain of gold to India, so to speak, which would result from the adoption of this scheme?—Yes.

1514. In other words, to get an important point quite clear, India will have to take another £103 millions of gold from other holders of gold in order to carry the scheme out?—Yes.

1515. I should ask you here whether you could expand a little what weight you attach to the final paragraph of your memorandum.—'The drain of gold to India and the sale of large quantities of silver might have serious world consequences which would inevitably react on India, but it would probably be possible to avoid serious world disturbance by suitable arrangements'?—I think the gold difficulty and the silver difficulty are the two great difficulties in introducing a scheme of this sort.

1516. To take a few elucidatory figures, I believe that last year's total addition to the world's supply of gold was in the neighbourhood of £79 millions, was it not?—I believe it was.

1517. The total holding of gold in Great Britain at present is about 150 millions?—Yes, I think so.

1518. And, speaking very approximately from memory, the total supply of gold for monetary purposes in the civilised world is somewhere about 1,300 millions?—I am afraid I have no figure in my mind.

1519. We must correct it by more careful statistical information. In relation to the total production and supply of gold would you tell us what weight you attach to its possible cause on disturbance?—I think if India set out to do this without consulting anybody, without making arrangement with anybody, it might have a serious effect on the world prices; but there are special circumstances at present existing which might, by suitable arrangements, take away very largely and possibly altogether from the effect on gold prices. That is to say, the United States of America has a large amount of gold sterilised. If by an agreement with the United States we can in effect draw this 100 millions out of their stock which is sterilised, presumably, the effect on gold prices need not be very serious.

1520. It is an attractive suggestion. What form of bargain do you suggest?—I admit we have very little to offer in return.

1521. Have you been able to outline at all in your mind the nature of the financial arrangements with the Federal Reserve Board which will enable you to draw this gold holding from the United States?—You mean the actual machinery for withdrawing it.

1522. Yes?—I have no very clear outline in my mind. But I admit that we go to them with comparatively little to offer in the way of inducements to them to help us in this way. The only thing we can say is that it will assist in putting the currency of one of the great trading nations of the world on a sound basis and they have assisted other nations of the world in putting their currency on a sound basis by supplying them with gold credits.

1523. Is there any case known to you in which gold credits have been supplied for the purpose of supporting gold circulation?—No, there is none.

1524. (*Sir Henry Strakosch.*) You estimated the total requirements of gold would be £103 million sterling. Does that figure include the silver coin and silver hoards held in the Native States?—It takes no account of those except in so far as the silver coin is legal tender in British India.

1525. So that the figure of £103 millions would have to be increased by whatever silver emanating from those quarters may be expected to be exchanged for gold?—Yes, emanating from any source other than coined rupees.

1526. (*Chairman.*) I think we have dealt with the silver market at some length by anticipation in the course of our morning's proceedings, and we come now to the important head, the cost of introducing a gold standard. On this question of cost you have replaced your former paragraph 20 by a revised version which the Commission have now received, the substantial effect of which is to arrive at a diminished cost for the introduction of the scheme, in substitution for the figures of a somewhat higher cost at which you originally arrived. We, therefore, disregard your previous paragraph 20 and deal now with your revised paragraph 20. You point out, in the first place, that the real assets held in the Government reserves at present amount to 154·7 crores, of which the only constituent part which is based not upon realised facts but upon estimate is the value of silver in the paper currency reserve which is liable to those elements of uncertainty with which we have dealt?—Quite.

1527. Your next step is to assume that 90 crores of Government rupee securities would be held in the reserve as finally constituted. This, we observe, is the figure given by Sir Basil Blackett in his memorandum, as distinguished from the larger figure of 94·8 crores which was given in your lay out for the reserve?—90 crores was the figure given in my memorandum too—paragraph (*d*) (*iii*), "The remainder should be rupee securities of which not more than a fixed amount, say, 90 crores, should be Government securities."

1528. I think we shall find that in order to make your reserve balance against a total circulation of 189·5 crores, taking your gold and sterling securities at 56·9 and 37·9 crores respectively, we shall have to allow 94·7 for the rupee securities?—There might be rupee securities other than Government securities. They would be real assets.

1529. The excess over 94·8 crores might be bills; similarly 90 crores of Government securities would be held in the reserve as finally constituted. This gives you 99·5 crores of the above assets which can be used usefully for the reserves. That is, 189·5 *plus* 90 crores of Government rupee securities?—Quite.

1530. If you deduct 99·5 from 154·7 you arrive at a figure of 55·2 crores available for the cost of redemption of tho 110 crores presented by the public. You thus arrive at the conclusion that there are just sufficient real assets in the actual cash to meet the cost of redemption of rupees presented. Then I understand that you proceed by the following reason: That you have enough of real assets to meet the gross outlay for the redemption of rupees ultimately. You cannot realise those assets as soon as they are required because you have to sell your silver by degrees. Realisation of your assets thus lags behind the purpose for which they are required. In order to cover the lay out, you have to raise external credits and the cost of your scheme is to be measured, in the first place, by the expense of raising those external credits which are ultimately repaid?—Yes; that is correct.

1531. And, in addition to that, the cost of your scheme is measured by whatever larger amount of gold as distinguished from sterling securities you have to carry under the final arrangement in comparison with that which you now carry under the present arrangement?—Yes, broadly, I think.

1532. "The final recurring cost would be the difference between the interest now received on sterling securities in the paper currency reserve and the gold standard reserve and the interest which would be received on the sterling securities in the reserve as finally constituted." That is to say, the interest on 80 crores which is your present holding of gold in sterling securities, less 42·6 crores. I find difficulty in identifying this figure of 42·6 crores. Possibly you can identify that figure for us?—I think I can put it more clearly in this way. If you are going to have 99·5 crores of real assets in your reserve, of that 56·9 would be gold. The remainder of your real assets would be in securities, either sterling securities or rupee securities. I have assumed for the sake of calculating the cost that they are all sterling securities.

1533. So that you arrive at the 42·6 in the following manner: first of all you add the rupee securities to the gold and sterling securities, 90·56=146·9. Deduct that from the 189·5, total circulation, 42·6. What does this figure of 42·6 represent? Sterling securities and a certain number of rupee securities other than Government of India securities?—(Secretary): Yes.

1534. That gives you a loss of interest on 37·4 crores, and you calculate that at 3 per cent. How do you arrive at the figure of 3 per cent.?—That is roughly the interest we are getting on our short-term securities in the gold standard reserve.

1535. That is the final cost, not allowing for the cost of certain credits raised during the intermediate period?—Yes.

1536. And you then proceed to calculate upon such hypotheses as you can make?—Yes.

1537. You allow for the conversion of 20 crores of gold securities in the first place to meet the initial rush which, added to your 29·7 crores of gold already held, gives you approximately 50 crores for that purpose?—Yes.

1538. Your next step causes me some difficulty and needs I think a little elucidation. You say "Assuming that the whole of the stock of gold is used and

that the Government would have to hold a stock continuously during the transition period of a further 10 crores of gold securities to be converted into gold." I may explain to you my initial difficulty there. You have got 52·8 crores available, of which, by hypothesis, you exhaust 50 crores, leaving 2·8. You then assume that you must convert a further 10 crores of gold securities into gold. If that is to be done, it can only be done by either holding at your disposal 26·9 crores required for the reserve or by an immediate fresh borrowing?—No, I think I can put it in this way. I have assumed that at the first rush the whole of the 50 crores of gold held by Government is taken from Government, that is to say, it is not supplied through other channels, through imports of gold; but if that happens, then the Government would have to convert 10 crores of their securities into gold in order to keep a spare amount of gold.

1539. These will be gold securities in the paper currency reserve?—Yes. You convert another 10 crores of gold securities in your reserves into gold.

1540. Supposing, just to complete the process, you have to use that gold for the purpose of redeeming rupees, how do you replace it in the paper currency reserve?—I am assuming that after the first rush the whole of the gold required will be obtained by the imports of gold which Government will force by keeping up exchange to the gold point.

1541. I have not quite apprehended the process yet. What have you left in the form of sterling securities outside those held on account of the paper currency reserve during this period?—I go on to give the process further on. I say, at first you are going to have a demand of approximately 52·8 crores and I allow for the possibility that that demand will be on the Government's gold. Thereafter there will be no demand on the Government's gold as the public demand will be met from the increased imports on private account. That uses up 50 crores of the Government's gold but you have got 30 crores of Government securities. You turn 10 crores of those sterling securities into gold and you still have got your necessary reserve. Then I assume that the demand is met either entirely by the imports of gold as it will not exceed the amount by which Government can force imports of gold—it will not exceed 46 crores a year.

1542. What is the point of turning your securities in the paper curreucy reserve into gold?—Because part of that demand may come on the Government's gold, and you must have some stock continuously of gold.

1543. And if you use it?—Then the demand on your sterling securities will be 10 crores less, because your imports of gold will be less by 10 crores.

1544. Is the process this, that equivalent sterling securities will then be transferred back to the paper currency reserve to replace the gold that is taken out, that is lost, 10 crores?—Yes.

1545. Now we come to the next element of uncertainty, as to the amount of external credit which will be required. You say it seems unlikely that the maximum amount of external credit will exceed 30 crores and by the end of five years it will be repaid completely by the process. I do not think I quite follow what the nature of the maximum which you are estimating there is. Is it the maximum amount at any given time?—Yes.

1546. So that from first to last the total debt in respect of these borrowings will not exceed 30 crores? —Yes. I meant the amount of the credit will never amount to more than 30 crores.

1547. And you base on that the assumption that the average amount of the external credit will be 15 crores. Is that a conjectional figure?—I can tell the Commission how I arrived at it but I think they will have to take a pencil and a piece of paper to understand my elucidation. You have to redeem 110 crores of rupees of which you have sterling assets of the amount of 52·8 crores. Now if we assume during the first year that 92·8 crores of rupees are put in for redemption you have to obtain a credit of 40 crores of rupees less the amount you have realised by the sale of silver. Assuming you have realised 10 crores by the sale of silver the amount of your credit at the end of the first year will be 30 crores.

1548. As you yourself suspect, this is a subject we shall have very great difficulty in following unless we have it down in black and white. Might I suggest that we should have the advantage of your calculatious before we try to analyse the details of this most important calculation. I think what is wanted, if I may say so, is that we should attempt to get something in the nature of a balance sheet of assets and liabilities for each period of the proceeding, and that it appears to me from the figures you have just given to us it might be possible to put down, assuming these bases which you have had to assume throughout the calculation, the state of affairs at the end of the first stage and at the end of the second stage, and a final balance sheet at the commencement of the third stage? —I think that it could be done but it involves making more assumptions as to the rapidity with which the rupees will come in. I think I can give you something like that after a time.

1549. I may say the particular interest of dealing with the matter in that way is that it does help to elucidate just where the regions of assumptions are, just what is fact and what is necessarily based on hypothesis?—I think I could give you something; it would take some time.

1550. I think I might, if the Commission will allow me, go into the sort of thing that would be useful to the Commission in the way of a statement of the position; it might save you a good deal of time in shortening the proceedings and leading just to the actual points which would be most illuminating to the Commission, if the Commission would permit me to do that perhaps before the next occasion. At present I am afraid we are groping?—Yes.

1551. At any rate, as the result of your calculations you arrive at the following conclusions. The important conclusions are that the average recurring cost will be 75 lakhs on the borrowings and therefore during the first 5 years the average recurring cost will be $90 \cdot 75 + 165$ lakhs and then the annual cost during the second 5 years will gradually rise from 90 to 112 lakhs. In your second substituted paragraph you summarise the matter by saying the recurring cost will be 165 lakhs per annum during the first 12 years and 105 lakhs thereafter. Now I want to refer you, if I may, to Sir Basil Blackett's suggestions by which the cost might be still further reduced. With two we have already dealt. We have dealt with his reduced estimate of a basic figure of 100 crores for redemption. We have also dealt with his proposal in connection with the new Currency Reserve. There is another proposal made both in your memorandum and in his for reducing the cost to which reference has not yet been made, and that is the proposal for an import tax on silver. Will you describe how that tax would operate to reduce the cost of this scheme?—Well, broadly it would make the price of silver in India 4 annas an ounce higher than the price in the rest of the world and therefore would enable the Government to realise for their silver by selling it in India a price 4 annas in excess of the general world price. It would give Government a protected market for the sale of its silver.

1552. That assumes that the Government would find inside the protected market a sufficient demand for the whole of what it has to sell?—Yes.

1553. Is that a safe assumption?—Judging by recent imports it seems a fairly safe assumption. The net imports in 1922-23 were 80 million fine ounces, in 1923-24, 86 million fine ounces, in 1924-25, 95 million fine ounces. If we spread the sales over 10 years the amount of our sales will be 68 million fine ounces, which is considerably less than the average import of the last 2 or 3 years.

1554. What would be the social and political reactions of such a duty?—I think that the bullion interests would certainly protest rather bitterly

because they would say that an import duty without a drawback would distinctly interfere with the operations on the bullion market, because they not only import but export. Their operations extend to China and London and New York, and they would say it would seriously interfere with their business. They are specialised interests which would be hit to a certain extent by such an import duty. As regards the general effects, I cannot see that they would be of any great magnitude because it could not be said or it could hardly be said that Government was imposing an undue burden on the poor man who wants to get his ornaments in the form of silver because by Government action the price of silver would have been reduced very considerably, and by another Government action the drop in the price in India would be less than the drop in the rest of the world. The cheapness of silver for the ordinary consumer would have been brought about directly by one set of actions on the part of Government and another set of actions on the part of Government would tend to take away some of the decrease in the price. When the import duty was previously in force I think the main arguments against it were two, the effect on the poor consumer and the effect on the Bombay bullion market.

1555. (*Sir Reginald Mant.*) Mr. Denning, you gave us just now the figures of imports of silver in the last 3 years. How do those compare with the average of the 5 pre-war years ending 1913-14?—I have got the figures in crores but not in ounces—I am afraid I have not worked out the pre-war figures in fine ounces.

1556. That is my difficulty. The average in crores is 7·72 according to your statement comparing with an average of about 19 crores for the last 3 years?—Yes.

1557. Those last 3 years show a very large increase on pre-war figures. Isn't that increase partly due to the fall in the price of silver?—I should like to know the price of silver before the War.

1558. No. I do not mean before the War. I mean the previous years in which there was a very small import. The price was very high, silver was not obtainable and there were very small imports. Then the price dropped and you have 3 years of very heavy imports?—Yes.

1559. Those 3 years imports were rather abnormal, weren't they?—Yes they were.

1560. Now do you think it is safe to measure your future market on this basis during the next 10 years when you are unloading your silver, do you think it is safe to compare the absorbing power of India with those three abnormal years?—Not to the full extent of the demands of India for the last 3 years. But the average demand of India for the last three years works out at about 87 million fine ounces.

1561. Can you get it reduced somehow to a common denominator?—I could have calculations made if necessary.

1562. What I wanted to get at was how the average imports of the five pre-war years ending 1913-14 compared with the amounts that you propose to sell in the next ten years?—Well it is rather difficult to compare them on the figures given in Appendix II; but then I don't think that the pre-war absorption of silver is necessarily a good index of the permanent post-war absorption.

1563. But those pre-war figures include Government imports?—In Appendix II they do not include the Government imports.

1564. Why do you think they are not a good indication of India's future demand?—Because the whole basis has been changed.

1565. In what respect?—Prices have changed, the amount of the balance of trade has changed.

1566. Can you explain how that will affect silver imports?—I think it is quite possible that there may be a bigger surplus in India available for the purchase of silver. The indications are that there is a bigger surplus available for the purchase of precious metals generally.

1567. The point is this; these last three years have been years of abnormally large imports. What I want to know is whether you think it safe to base your estimate on these imports, whether it is safe to assume that India will be able to absorb silver on so large a scale for the next ten years?—Perhaps not absolutely safe. There is the possibility that the absorption will not be so large, I admit.

1568. And to the extent that you cannot sell in India your estimate of the gain from the import duty will be reduced?—I agree. Yes.

1569. And also you would have to export silver and probably further depress the price in outside markets?—Unless you spread the sales of silver over a longer term of years; and that also would increase the cost.

1570. (*Sir Henry Strakosch.*) With reference to the question the Chairman put to you regarding the social and political effect of a heavy drop in the price of silver you did not attach any great importance to the fact that the imposition of a duty of four annas on silver would prevent the people of India from buying silver at the true market price abroad. Might they not argue that the Government had deliberately depreciated silver to their detriment, and, having done so, they are imposing a duty upon it of four annas which would prevent them from taking full advantage of the drop in the price of silver to purchase silver at its true value abroad. Would they not have two points of grievance rather than one?—From the point of the seller of silver in India it would be an advantage, would it not, to have a four-anna duty.

1571. But the supposition is that the Government would have bought 200 crores of silver?—Yes. But I am talking of the point of view of the seller in the market; the man who wants to get rid of his silver would get a better price for it by four annas than if you did not put on an import duty.

1572. Did not you say this morning that the effect of the announcement of this policy would be to immediately depress the price of silver to so low a level that no sales would occur but rather that the people of India would buy at the cheaper price, so that there is no question of selling silver in India until it has reached a price which will be attractive to the purchaser?—I am taking the whole period of ten years. There will be transactions between various people in India. We have to look at it from the point of view of the seller and the buyer as regards the effect of the imposition of a four-anna duty.

1573. True. But we have started from the supposition that the people would not or could not sell at the higher price but would rather add to it by buying more silver because it is cheaper. We started from that supposition this morning and therefore we have got to regard the position of the Indian who has not sold his silver but wishes to add to his store of silver, and would he not have two grievances, (*i*) that that store of silver has been depreciated in value by the policy of the Government, and (*ii*) that having depreciated, the value of his store the Government imposes a duty of four annas which prevents him from taking advantage of the low level of silver abroad?—To take the second of the grievances first, my point is that it will be on account of one direct action of Government that the price of silver has gone down; it will be on account of another direct action that the price of silver in India has not gone down to the full extent that it has gone down in the world and therefore the answer to the consumer is "By two Government actions we have given you silver at a cheaper price than you would have got it unless we had taken either of these actions." I admit that he may think it a grievance that he cannot get it as cheaply as the rest of the world; but will that be a reasonable grievance?

1574. (*Sir Henry Strakosch.*) Thoroughly reasonable, I should say.

1575. (*Chairman.*) Does not political experience teach one that the public critics of the Government will have it both ways?—It is possible.

1576. As regards the action resulting in the fall of the price of silver, they would say that the Government had destroyed the value of their hoards. . As regards the action resulting in the rise of the price of silver they would say: "You are preventing us from getting the benefit of cheap silver elsewhere"?—They may say they have a grievance both ways; I quite agree.

1577. (*Sir Maneckji Dadabhoy.*) There is a great deal of sentiment in India on the question of an import duty on silver. Is it not?—I believe there is.

1578. And the masses generally for want of banking facilities, or rather the banking system having not sufficiently developed in the country, invest their money in buying silver generally?—Part in silver and part in gold.

1579. So you will admit that the imposition of a silver duty would be a tax on tho savings of the people?—To a certain extent yes.

1580. Why to a certain extent?—Because I combine it with the other action. I am not suggesting that we should now in the present circumstances put an import duty on the silver. What I am saying is that when we take the one action of redeeming silver and therefore lowering the price of silver, then we should take the other action also. The one would tend to counteract the other to a certain extent and the broad effect would be that silver would still be cheaper to the Indian consumer.

1581. Would it be cheaper?—Assuming that price of silver will drop more than four annas per ounce.

1582. Referring to the high prices of silver when silver went up after the War, was it not due partly to the wrong policy adopted by the Government of India in excluding Indian silver from the markets of the world?—That raises the discussion of a very large question. In the first place I should have to discuss whether the Government policy was wrong.

1583. Did not this prohibition of the exports of silver raise the price of silver in the foreign markets? You admit that we had a very large stock of silver before the War in India and if our markets had been unfettered and export had been permitted the silver price would not have gone to that pitch?—If the other circumstances had permitted such a situation as you assume, that might be.

1584. Is it a fact that by Ordinance after the War silver was excluded from the European markets and our exports were stopped?—Yes. Up till about June 1920.

1585. And did not that have the direct effect of raising the prices? If our stocks had been set free the price of silver would not have gone so high?—You have got to assume that the Indian Stocks would have gone out to the world; it does not follow that they would.

1586. With these high prices?—But consumers in India were still taking silver, they were still melting silver rupees.

1587. After the War?—Yes.

1588. It would have paid India to have melted down silver and exported it?—But Government had no spare silver and the people were still melting down our rupees at that time.

1589. What period do you refer to?—I refer to the period when the price of silver was so high and we were coining new rupees to meet the demand for silver rupees continually. Part of it was due to the melting of rupees.

1590. But you prohibited that by Ordinance?—Yes. But it was carried on; prohibition by Ordinance, I am afraid, did not prevent melting.

1591. (*Sir Maneckji Dadabhoy.*) My information is quite to the contrary.

1592. (*Professor Coyajee.*) You observe that the Government here would protect the market here for its silver by the silver import duty. Is it not equivalent to this, that it wants to transfer to the silver consumer a part of the cost of its gold standard?—No, there we come back to the same point. The consumer of silver would be better off as regards the price of his silver on account of Government adopting the gold standard policy; he would be better off to the extent, we will say, of 9 annas per standard ounce. Instead of making him better off by 9 annas, we shall have made him better off by 5 annas only because we should put a 4-anna duty on imported silver.

1593. But since as Sir Maneckji told us it has to be adopted as a sort of banking method, a fall in the price of silver does not benefit him indirectly so much as the rise of the local price of silver harms him?—If he is not going to realise his silver, it does not make any difference what the price of silver is.

1594. If it has to be invested it has to be realised later on?—I do not think that this 4-anna duty on silver should necessarily be a permanent duty. I think that it might be removed after the gold standard has been established. Then the price of the consumer's silver would automatically right itself.

1595. (*Sir Maneckji Dadabhoy.*) You said, Mr. Denning, that it would be necessary to spread the sales over a long period not only with a view to obtaining a better price but also with the object of diminishing the disturbance in countries having a silver standard and the adverse effect on the prosperity of the silver mining industry throughout the world. I do not exactly follow how you work it out?—If there is a large drop in the price of an article the producers of that article usually suffer and presumably the silver mining interests would suffer considerably if there were a large drop in the price of silver.

1596. Not immediately?—I think immediately because they would have stocks on their hands which they would have to sell at a much lower price; and as regards their future production, if they were to produce as much at the lower price, they would not get such large profits.

1597. But a large demand has to be met?—Certain quantities have to be raised to meet the demands of the world?—The world's demand would be decreased by the amount that India was selling; by 68 million fine ounces a year.

1598. (*Chairman.*) You say that with the reduction in the price of silver it is no longer worth while to work certain mines?—Quite.

1599. (*Sir Purshotamdas Thakurdas.*) Regarding Sir Maneckji Dadabhoy's enquiry about the year 1920, was it not about that year the Government of India almost escaped facing inconvertibility of the notes here owing to want of silver in the treasuries?—That was earlier; in April 1918.

1600. And it lasted till about 1920?—Yes.

1601. Regarding duty on silver one and the same man could not say that Government has depreciated his hoards by their policy and at the same time say Government are putting on a taxation on consumption of silver. The man who holds the hoard does not want to buy more; he is only concerned with the depreciation of his hoard. His complaint would be that by their policy Government is hitting him because they have really reduced the price of silver. He would have no complaint against anything that Government may devise to support the price of silver by an import duty?—Unless he wanted to add to his hoard.

1602. The man who wanted to add to his hoard is not a person with whom the average Indian public would sympathise very much, with his grievance at any rate?—A certain amount of sympathy has been shown in the past.

1603. Has there?—Yes, I think so.

1604. The main argument has been regarding the poor men who put their savings in silver, and Government taxing them as Sir Maneckji Dadabhoy said?—Is there much difference between hoards and savings of silver?

1605. That poor man would not like to buy more silver, when he has had it already depreciated. What I am trying to point out is, could one man have the same grievance both ways?—Not justifiably; but I think it may be made into one.

1606. Do you know of Government's policy of prohibiting, when there is famine or acute scarcity, export of food-grains?—They have done so.

1607. Thereby effectively bringing down the prices of food-grains and preventing them from rising further?—Yes.

1608. A man in that case who holds the stocks has a grievance against Government and their policy?—Yes. The producer certainly has a grievance.

1609. Have you found the average Indian public sympathising with his grievance?—No. I cannot say that they have.

1610. (*Chairman.*) Can you tell us when the last silver duty was put on and taken off?—I think it was taken off in 1920 and I think it was put on in 1910.

1611. Can you tell us the circumstances in which it was taken off?—It was taken off as a result of the recommendation of the Babington Smith Currency Committee. It was done largely to meet the popular demand. I think that was the main reason influencing the Committee.

1612. There was a popular demand that the duty should be taken off?—Yes.

1613. Which made itself felt in political regions?—Quite.

1614. It was recommended by the Babington Smith Committee that it should be taken off?—Yes.

1615. I have only one further question to ask you. We have referred, I think, briefly, in the course of the previous discussion to the question of an Indian gold coin. I think we should have on our record what, in your opinion, is the weighty argument in favour of that course, and what, if any, arguments against it?—I think I have dealt with that fairly fully in paragraph 21 of my memorandum on "A gold standard for India," and I have very little to add to what I have said there.

1616. You say "the putting of the sovereign into circulation almost necessarily implies that the rate of exchange would be fixed so that there would be an even number of rupees to a sovereign, whereas the rate of exchange is immaterial if India has a separate gold coin". At the present rate for the sovereign there would not be an even number of rupees?—No.

1617. Nevertheless you yourself express an opinion in favour of the fixation of the present rate?—I do.

1618. So that it does not imply such an absolute necessity as one might gather at first sight from this?—I am afraid I do not quite follow.

1619. "Putting the sovereign into circulation almost necessarily implies that the rate of exchange would be fixed at an even number of rupees to the sovereign." Nevertheless you are contemplating that a sovereign at the present rate should be in circulation?—I am using that as an argument against it. I say the arguments in favour of a distinct gold coin are as follows; then I give four arguments. The main argument in favour of the sovereign is that given by the Babington Smith Committee. "It would be more advantageous to India to continue to use the form of gold currency to which she has been accustomed and which is universally recognised for the settlement of external obligations."

1620. I cannot quite understand this. You recommend, for instance, under a gold exchange standard system that the sovereign should be in circulation?—No, I recommend that a gold coin of 20 rupees should be in circulation.

1621. Supposing the rate were to be fixed at 18d.; you say that would exclude the possibility of having the sovereign in circulation?—I think almost it necessarily follows as it would be very difficult to have a sovereign in circulation of which the legal tender value would be Rs. 13-5-4.

1622. Then you say: "At first, at any rate, a separate gold coin would probably not be used to such a large extent as the sovereign for ornaments and hoarding". What would be the cause of that?—Over a large part of India the sovereign is definitely preferred because the ryot knows what he has got. I believe in Bengal for instance it is a very widespread practice to take gold sovereigns to the village *sonar* and have them melted down and made into ornaments. The ryot thinks that he is likely to get real value for what he has given in gold, if the gold is in the form of sovereigns. Probably his predilection in favour of the sovereign is based on an illusion because I do not think it follows that the village *sonar* does not take a part of the gold and give him gold of less fineness in his ornaments. But there certainly is that predilection.

1623. In short, he would understand the sovereign, but at first he would find the Indian gold coin a less familiar form of gold?—That is what I meant really. I was trying to explain the use of the sovereign for ornaments and hoarding.

1624. (*Sir Maneckji Dadabhoy.*) This scheme of a new distinctive coin, would it not be looked upon with suspicion by the illiterate public. Would they not think that Government has some sinister scheme behind it, if you did not have the sovereign, but created this new coin?—They did not think that there was anything sinister when the Government issued gold mohurs in 1917-18.

1625. The gold mohur is not a new coin altogether. It is an ancient coin. They have been in the country over a very long period?—But not in that form. The gold mohur was an entirely new coin with "Rs. 15" on the back of it. There was nothing on it to show that it was a gold mohur.

1626. You will admit that it was not as popular as the sovereign?—I do not admit that; our experience was that it was taken very freely, much too freely for our liking.

1627. So that there would be no suspicion attaching to your new coin?—I do not think so.

1628. It will be taken as readily as sovereigns?—I think so, after a time any way.

1629. (*Sir Norcot Warren.*)—Is it not true that very few of these gold mohurs have ever come back?—Very few.

1630. (*Sir Henry Strakosch.*) What would be the effect of the introduction of a new gold coin upon the holding of sovereigns in this country which no doubt is large? Would they have to be re-coined, because I take it that the new coin would be the legal tender money of the country?—I mentioned that point I think, in the last sentence of paragraph 21 of the memorandum. I suggested that we should give them out during stage (I) instead of gold bars.

1631. Yes, but if you make the new gold mohur the legal tender money of the country then a sovereign will not be legal tender?—No, but at stage (I) of my scheme, there will be no gold coinage in circulation. There will be no legal tender gold coinage. That will come later.

1632. I am thinking of the later stage when gold coins do become legal tender?—Then Government will, I presume, have got rid of its store of sovereigns and there will be no question of re-coining.

1633. But the public will have them?—Oh yes.

1634. My question was, what is going to happen? Will they have to be re-coined?—No, not unless they are presented to the Mints as ordinary gold bars.

1635. But if they are presented and it seems likely that they will be presented when the new gold mohur is the legal tender money, then the whole of the sovereigns in the country will have to be re-coined?—No, I don't think so; because there is a tremendous demand in India for the gold sovereign merely because the people like that form of bullion and it is really a bullion demand and not a coin demand.

1636. But if that is so, then you will have people still possessing sovereigns which will be worth Rs. 13-5-4 pies. You won't be getting away from that difficulty?—Yes, but they won't be using them as a medium of exchange. They will simply be keeping them as store of value.

1637. Yes, but at certain seasons, stores of value come out into circulation. If you have one or two

bad seasons, these sovereigns will come out and circulate and they will be taken at that figure. If there are many sovereigns in the country, then the difficulty will still exist?—No, I am proposing to remove the legal tender attribute of the sovereign, so that it cannot be used as a medium of exchange. If they want to exchange their sovereigns they would do it in exactly the same way as their hoards of gold bars. In fact, the sovereign would be put on the same basis as a gold bar.

1638. (*Professor Coyajee.*) Is there any idea of demonetising tho sovereign then?—Well, I propose that its legal tender character should be taken away. I say there is no harm in doing that because in 1920 we offered to convert all sovereigns at Rs. 15 to the sovereign which was the legal ratio then. Since then, a new ratio has been introduced of Rs. 10 to the sovereign which has never been effective. That is to say, the sovereign has not been in effective circulation for many years.

1639. But has any other Dominion thought of demonetising the sovereign?—The sovereign is not legal tender in many Dominions. It is not legal tender in Canada.

1640. (*Sir Reginald Mant.*) Mr. Denning, you propose to demonetise the sovereign with a view to introducing another gold coin leading up to your gold currency—is not that your position?—Yes.

1641. Supposing it was decided to adopt a gold exchange standard without a gold currency. Would you still declare the sovereign not to be legal tender? —I should see no harm in doing so. It seems to me rather absurd to have a coin of the value of Rs. 13-5-4 pies as legal tender.

1642. Ah, but you are assuming now the 1s. 6d. rate. Assuming merely that we are seeking the ideal system and supposing it was decided that the gold exchange system is best—would you in that case demonetise the sovereign?—That would really depend on the rate of exchange adopted. I think I certainly should if the legal tender value at your rate of exchange would be Rs. 13-5-4.

1643. Interchangeability might be a factor in determining the rate of exchange to be adopted. You are rather putting the cart before the horse. You would say—demonetise because Rs. 13-5-4 is an awkward proportion?—If you put it that way, I don't particularly wish to demonetise the sovereign. But I do not see any particular harm in doing so.

1644. It is because you prefer the 1s. 6d. rate that you recommend demonetisation of the sovereign?—Well, yes, that is one of the reasons. Another is the question of a Royal Mint in India. It is a question which ought to be taken into account. I think you are examining Colonel Willis and he will give you more details as to the disadvantages of having a Royal Mint instead of a mint of our own.

1645. But under a gold exchange standard it would not be necessary to establish a Mint in India?—If you going to put gold in circulation to any appreciable extent.

1646. I was not assuming that it would be put into circulation. I understand the gold exchange standard you describe in these papers does not contemplate Government putting gold into circulation. Government is to exchange notes for foreign currency?—In the scheme I have outlined I have also assumed that Government would undertake to give gold coin in exchange for gold bullion. It is not a necessary feature of the gold standard I admit.

1647. I think you have described it on page 3 of your memorandum. Notes convertible into silver rupees or foreign exchange.—I admit that a gold currency is not a necessary feature of a gold exchange standard system.

1648. And it would not be necessary for Government to establish a branch of the Royal Mint in India?—Not necessarily in order to put a gold exchange standard into force. A gold exchange standard with a gold currency, yes.

1649. It would be with a gold currency?—Yes.

1650. But not with a gold exchange standard?—No.

1651. (*Chairman.*) There is only one other matter in which you may be of assistance to us. It will be useful some time in our inquiry, in relation both to the exchange position and in relation to the position of a possible Central Bank, to have a view of the position of the Indian Banks as regards home and foreign liabilities. Can you tell us whether there are any returns published or any statistics available showing the relation of the Indian liabilities to the Indian assets of the Indian banks?—I don't think there are any statistics from which you could get that information.

1652. At any rate there is no statutory requirement to show a return?—No.

1653. And you do not think there is any source of information on that subject?—The only people you can get it from are the banks themselves. I don't think there is any other source, because I don't think they publish their assets and liabilities in various places separately.

1654. I think I have come to the end of the questions I wanted to ask, subject to the possibility, Mr. Denning, that we may have the advantage of a further consultation with you after we have seen the analysis of the stages of the cost of the introduction of a gold standard?—May I suggest that you should do that in Calcutta, Sir, because I was going down to Calcutta to-night and, if you will leave that question until you come to Calcutta, it will give me more time to look into it.

1655. (*Chairman.*) I am sure it would be equally convenient to the Commission.

1656. (*Sir Reginald Mant.*) May I ask Mr. Denning if he can supply us with the figures that I asked for showing in fine ounces the imports of silver on private account in the 5 years ending 1913-14.

1657. (*Chairman.*) Sir Reginald Mant will let Mr. Denning have a memorandum showing precisely what it is that is required. Mr. Denning, I am sure my colleagues desire to thank you for your very helpful evidence in the course of these two days.

(*The witness withdrew.*)

SIXTH DAY.

Tuesday, December 1st, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANEOKJI BYRAMJI DADABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E., } (*Secretaries*).
Mr. G. H. BAXTER,

Lieut.-Col. G. H. WILLIS, C.I.E., M.V.O.. called and examined.

1658. (*Chairman.*) May we have just for the sake of our record the official designation of the position you occupy at present Col. Willis?—I am Senior Master of the Mint, on special duty at present. I am now employed as officer in charge of the Security Press for printing stamps, postage and others, and the orginal idea was that the press should also print the one rupee note.

1659. As regards the former appointment, since when have you occupied that appointment?—Since 1922.

1660. And before that?—Before that, Junior Mint Master, since 1915.

1661. There was at one time a branch of the Royal Mint in Bombay: when was that first opened?—I am afraid I cannot give the exact date. It appears in the Mint Reports. Perhaps about 1919.

1662. And is that still open?—No.

1663. When was it closed?—It functioned for about a year.

1664. That was, just after the war period?—Yes.

1665. While it was functioning did the arrangements work smoothly or otherwise?—Perfectly smoothly. The Bombay Mint did most of the work. The Royal Mint only did the actual striking of the coins and the weighing. The whole of the melting, rolling, preparing blanks for coinage, was done by the Bombay Mint and we handed over to the Deputy Master of the Royal Mint the finished blanks for striking and final weighment.

1666. There was working at the same time in Bombay a Bombay Mint and the branch of the Royal Mint?—Yes.

1667. The branch of the Royal Mint was not a complete Mint?—It was supplied with the machinery from the Bombay Mint just for these two purposes only.

1668. Had the Royal Mint a separate plant and building?—A separate building; yes.

1669. How was the Royal Mint controlled as regards administration?—The Royal Mint sent out from Australia an officer and appointed him Deputy Master and an Assayer from London to do the assay. Actually the Deputy Master did assay work too, when required; he had been an assayer in the branch of the Royal Mint at Perth, Western Australia.

1670. Why was the branch of the Royal Mint closed?—There was no possibility of issuing sovereigns as they would go straight into the melting pot.

1671. I think I have seen it stated somewhere that there was a difficulty also in securing personnel for the branch of the Royal Mint in Bombay?—The Royal Mint may have experienced some difficulty. I understand there was some difficulty. But as regards the working personnel there was no difficulty. They were all supplied by the Bombay Mint; except the two officers, they imported no other staff. You are perhaps aware, Sir, that the Bombay Mint before the Royal Mint opened, coined far more gold mohurs than the Royal Mint actually coined sovereigns—the fifteen rupee gold mohurs.

1672. If it were decided to introduce a gold coin into circulation in India, do you recommend the continuance of the sovereign and half-sovereign, or are you in favour of a separate gold coin for India, and for what reasons?—I am in favour of a separate gold coin for India. For the sovereign, from the point of view of the practical minter, is an unsuitable coin in that its design is such—I am not talking of the artistic merits—but its design is such that it is liable to more wear than it should be. Therefore, if it circulates it is a wasteful coin.

1673. Was that the experience in Great Britain before the war?—I do not know if that is a point which has ever occurred to the authorities at Home. We are dealing with very large quantities of sovereigns as we have been in the past importing into India from various parts of the world and having to examine them all separately noticed the defects possibly more than the Home people have noticed them.

1674. You say that sovereigns have had more stormy careers?—Yes.

1675. So that, in regard to the sovereign, this consideration is more important in view of the work which the sovereign has to do?—Yes. But my objection from a minter's point of view to the sovereign is that it has not a sufficiently wide or deep rim to protect the device on it—and that would be one of the reasons why I should prefer not to have the sovereign in circulation in India. I am not one of those who think it likely that gold coin of any sort would really enter into circulation.

1676. We will come to that question in a little more detail shortly. Are there any other reasons to which you attach importance for preferring a separate gold coin?—The use of the sovereign as a suitable coin would depend largely on the rate which would be fixed as the exchange of the rupee. Unless it were an integral part of the sovereign, a sovereign would not be suitable if it is as at present a fractional 13⅓ rupees; it would make it an awkward coin to deal with. I should also prefer to have—as in every country in the world except Great Britain—to use 900 touch, instead of 916·67 which is the nominal fineness of the sovereign, because the lower touch would discourage melting for ornaments, and it would be harder for jewellers to work. It would cost them more to refine it, and therefore it would tend to

help to keep in circulation, and the alloy is very distinctly harder, so that the coin itself has a better life.

1677. Supposing, on the other hand, that the sovereign were to be selected for a gold coin in circulation, would you be in favour of re-opening the branch of the Royal Mint at Bombay or elsewhere?—I think, Sir, it would be a good thing. I should be distinctly in favour of that. But I should hope that it would be entirely dissociated from the Bombay Mint; because it would be so much more advantageous and so much safer to have the gold operations carried out in one building under one supervision.

1678. Would you not then favour the restoration of exactly the same system that was adopted before?—No; that was an emergency system which was expensive and unsafe. Luckily we lost nothing; but we might easily have had defalcations.

1679. Where was the element of unsafety?—The first element was in working the gold in the Bombay Mint which is not designed for the working of gold. It is sufficiently secured for the working of silver, but the extra precautions to make gold working safe do not exist and could not be improvised as we were doing such heavy work in other lines at the same time.

1680. If a branch of the Mint be re-opened, you would have it self-contained?—Yes, a complete self-contained mint.

1681. You told us that you would prefer to see the Indian gold coin of that measure of fineness which is more generally adopted than the British measure. Can you tell us any other particulars about what you consider the ideal separate gold coin for India, for instance, its size and weight?—I should not like to see too small a coin. The larger you can have your coin—so long as it is of useful denomination—the greater the gold content of the surface and therefore the less the wear. I have seen Mr. Denning's memorandum, and I am in agreement with him, and regard the 20-rupee coin as a suitable coin. Of course, the gold mohur was never fifteen rupees, though it was marked fifteen rupees; that was the trouble; that is, the old traditional gold mohur, though of course the word "mohur" referred not to the value in the old days, for we had up to 1891 Rs. 5 and Rs. 10 gold mohurs and also 30 rupee gold mohurs had also been coined.

1682. What was your experience of the gold mohur while it was being coined: was it satisfactory technically?—We had no difficulties at all. I think technically it was satisfactory, and I think if we had gone on with it, it would have been a popular coin.

1683. In your opinion the existing Mint is capable of producing a satisfactory special gold coin?—There is no difficulty, except that I should prefer to build a completely separate small part of the Mint and keep the gold mint separate from that for the silver and subsidiary coin.

1684. Is that for the sake of safety?—Yes.

1685. (*Sir Purshotamdas Thakurdas.*) Did the gold mohur that you coined in 1919 contain the same quality and quantity of gold bullion as the sovereign?—Exactly. The difference was only in the impress mark on it, the design and the size. It was slightly larger in diameter. It bore on the obverse His Majesty's head, and the reverse was a repetition of the old design.

1686. Barring the difference in the design, bullion for bullion it was the same?—Exactly.

1687. Did you ever observe any difference in popularity between the mohur as it was then issued and the sovereign?—No. That would have been impossible to observe because I understand that the gold mohurs that were issued almost entirely went to the melting pot.

1688. That was because of the gold bullion value being higher?—Yes.

1689. Can you come to any inference regarding the fate of the gold that may be issued hereafter, from that occurrence?—The conditions then were so exceptional.

1690. It was more an accident than anything else?—Yes.

1691. Did anything come to your knowledge that the people preferred the sovereign better than the gold mohur?—I do not think I have any actual experience. A great many people speaking to me have asked me why we did not make an Indian gold coin.

1692. But that would indicate as if they were in favour of a distinctive gold coin for India?—That was the tendency of their question.

1693. Would there be any difference in the cost to be incurred if a Royal Mint was working here as distinct from an Indian mint working here?—I think that since you would already have your supervising staff in the Bombay Mint which you have to keep in any case for the subsidiary coinage, the duplication of the supervising staff necessary to provide a branch of the Royal Mint would inevitably cause the cost of coining sovereigns in India to be greater than the cost of coining mohurs where one supervising staff would suffice.

1694. Was there a double staff in 1919 when a branch of the Royal Mint was working here?—As soon as the Royal Mint began to function or rather before it functioned—it took a long time to get into action—there was a double staff—the Mint Master and our assayors in charge of the Bombay Mint and the Deputy Master and assayer in charge of the Royal Mint.

1695. There was more or less a sort of transfer: there was no new staff imported?—Yes, the Royal Mint imported two officers, one from Australia and one from England.

1696. And that is all that would be necessary to import in the case of a branch of the Royal Mint being started here?—That should be the only expense. We contend that the Royal Mint works rather more expensively than we do here in Bombay but I would not like to labour that point.

1697. Could you tell us to what extent it is more expensive? Could you give us either the monthly extra expense in round figures or so much per coin minted?—I think it is hardly fair to debit the branch of the Royal Mint with a figure of cost based on actuals, started as it was for such a short time and to turn out so few coins. The actual cost of turning out those coins is not what would be incurred in an establishment that was running continuously.

1698. Do I take it that if the establishment was running continuously, the extra cost would be very little?—It would be the cost of the extra supervising staff.

1699. Amounting to how much per month roughly?—I think it would be safe to say that it would cost Rs. 10,000 a month.

1700. For these two men?—They would require more than two men to do the whole work. The Bombay Mint was doing 6/7ths of the whole work of coining those sovereigns.

1701. Then with a full-fledged mint working here, the extra cost would be Rs. 10,000?—I think so, over and above the cost of coining an Indian gold piece in the Bombay Mint.

1702. Are there any other conveniences or any other want of facilities which you anticipate of a branch of the Royal Mint working here as compared with an Indian Mint?—None whatever so long as it was a completely separate establishment.

1703. And a completely separate establishment for the Mint would involve an extra cost of Rs. 10,000?—Yes, but it would of course be necessary for the Bombay Mint to expand for the coinage of an Indian gold piece.

1704. (*Sir Maneckji Dadabhoy.*) The coinage of gold mohurs was very temporary?—It was for very special purposes.

1705. What were the special purposes?—Anything I say in this connection is merely hearsay, for my work is merely to produce the coin. I was not concerned with where it went to. I understand it was employed for paying for wheat, and I am not sure

whether it was not also for cotton, which were purchased under special conditions. I believe that was the reason.

1706. And the demand soon fell off?—The demand did not fall off. The demand was insatiable and could not possibly be satisfied.

1707. But was that the real reason for closing it down? What happened to these gold mohurs?—I believe they were sent upcountry, some proportion of them were sent upcountry in payment for purchases.

1708. Were they ever brought back for recoinage?—The surplus balance that was not issued was brought back to be melted down and turned into bullion.

1709. You said that you recommend a bigger coin, of the value of Rs. 20, because the wear and tear would be less?—Yes.

1710. What would be the wear and tear in 10 years' time, in grains?—I think it is impossible for me to say. I fear that the largest portion of the wear and tear would be illicit and would be caused by electrical sweating. That is the trouble we find, with the gold coin that comes to the mints for examination before being paid into the reserves. It is possible by electrical methods to remove about 5d. of gold from every sovereign, provided it is a new sovereign, and so keep within the limits of acceptable weight; and that is extraordinarily difficult to detect except for a man who is used to examining coin closely.

1711. Am I to understand that your new coin with a lower touch and harder alloy would be proof against these risks?—That would not make any difference to the electrical sweating of the coin but it would make some considerable difference to the legitimate wear and tear. The length of the life of the coin would be greater; it would require recoinage less frequently.

1712. But this difficulty has not been felt in England—of this wear and tear, to which you attach so great importance, in a place like England and other countries which coin gold coins. Why do you overestimate this factor?—I am afraid that I cannot accept the statement that it has not been felt in England: the cost of recoinage of England's gold sovereigns, which is done free, by the way, in England, has always been a very considerable factor.

1713. But then is it not a fact that this is the consequence of all coinage, this wear and tear must exist in respect of any coin, the rupees also? The same result would ensue in respect of our coin?—It is to minimise that and make recoinage less frequent. It is a costly process, and the longer you can avoid it, the better, the cheaper to the country.

1714. You have a great deal of experience of gold coinage. Do you think that a new coin will be equally popular like the sovereign which has a tradition attached to it in this country?—I can only speak from the analogy of our gold bars in the Mint in Bombay. I am talking now of the personal feeling of individuals in the country, I think that many of them would prefer an Indian gold coin. But every coin when it is turned out is tested by every country in the world to see how nearly it approaches the weight and fineness that it purports to have. Every country is very careful to make those tests.

1715. (*Chairman.*) By an independent authority?—In assay offices. We have for instance tested every gold coin that has come our way and we know at what rate we can afford to take that gold coin as gold bullion into the Mint. For instance a coin which purports to be 900 fine, if it comes from Japan we know it is very very near 900 fine; if it comes from France it is also very near but not quite so near,—I am speaking on the average; from Germany also. France, Germany and the United States are about on a par. Some of the smaller countries we are not quite sure about; and we take a rather larger margin in allowing for bullion for the sovereign. We are not prepared to give the standard of 916·66 because we find when we assay a bulk of sovereigns, partly owing to the dirt they carry but partly because every coin is on an average slightly lower than the standard figure, we have to make that allowance; and if I remember rightly the fineness we assign to sovereigns is 916·5. That is rather finer than America is prepared to allow. So that there is nothing sacred about a coin directly you begin to regard it as bullion.

1716. Quite true, but do not you think we have to make allowances for conditions in this country?—To meet prejudices, perhaps we should say.

1717. Certainly. Am I to gather as the result of your discussion that a new gold coin of Rs. 20 would be as popular as the sovereign?—I think it would be quite as popular, and I should even expect to find it more popular.

1718. And you expect it to command confidence?—If it does not immediately command confidence it will very shortly as soon as they find that there is the gold in it that it professes to contain.

1719. Can you tell us what effect it will have on the present holdings of sovereigns—the new coinage?—I think practically none. Those who are holding sovereigns know what they have got and are unlikely to go to the possible expense of converting them into anything else.

1720. It will have no effect then?—I do not think so. I see no reason why it should have.

1721. And I understand you are in favour of one coin of Rs. 20 value, not smaller coins of gold?—Beyond the fact that a smaller coin suffers much more in circulation from wear and tear, as they used to find in the case of the half-sovereign at home, I have no objection to a smaller coin, say, a Rs. 10 subsidiary gold coin.

1722. One more question I have to ask you. You said something about the Bombay Mint being altogether too detached. I did not quite follow you. Am I to understand that the Bombay Mint is not constructed for the coinage of gold and therefore unsuitable?—Gold can be coined there but it is being coined under unsafe conditions which require greater expense in watch and ward, in watching the gold, and it is designed for such enormous coinages that it is really not suitable for the comparatively small coinage which a gold coinage would entail.

1723. You want a smaller building with greater safeguards?—Yes, with special machinery for the gold coinage.

1724. (*Sir Henry Strakosch.*) You mentioned that a new Rs. 20 gold coin of a fineness of 900 as against the present finenesss of the sovereign of 916, would be more popular than the sovereign; but are you quite sure on that point having regard to the fact that a coin of 900 fineness is less suitable to be turned into jewellery than a coin of a greater fineness, and especially having regard to your remark that you think the new coin will not circulate, from which I gather that you mean it will either be melted down or be put into hoards?—When I say that I do not expect a large circulation of gold coin, I think people will use it as a store of wealth—I do not necessarily say a hoard but a way of keeping their reserve. Of course, the question of what is a hoard is a very difficult one; and I think they will use it more for that. My other point that it is less likely to be melted into jewellery confirms my opinion that it is more likely to be used in circulation and less likely to be taken out of circulation to be used as jewellery.

1725. But would it be as popular having regard to the fact that it is less suitable for turning into jewellery when the people of this country are in the habit of melting down coins for that very purpose?—I think that the tendency is and has been for a long time past for people to abstain from melting down the coins to a larger extent than they used to and to buy the gold, the fine gold which they so much prefer and which they now can get in convenient sizes and quantities. I do not think there is a great deal of melting of sovereigns now compared with what used to be the case.

1726. Now let us suppose gold coins were put into circulation. You told us that the habit is rather prevalent in this country to sweat them. Let us suppose that there were put into circulation, gold coins to the value of 200 crores. What do you

estimate the loss through sweating and wear and tear would amount to—to the allowed limit; I take it they sweat down to the allowed limit?—Just inside the allowed limit to be on the safe side.

1727. And you estimate that to be how many grains?—Well in the case of the allowed limit for sovereigns it is actually 6d. worth of gold per coin.

1728. That is per sovereign?—Yes.

1729. That would be correspondingly increased on the new coin?—If you allow the same percentage limit.

1730. And would you say that having undergone the process of sweating the coin will very much sooner be under the prescribed weight?—Yes.

1731. And therefore will have to be recoined more frequently than if it had not been sweated?—Yes.

1732. Now then could you give us an estimate of what that would cost on the supposition, as I said, that 200 crores worth of gold coins were put into circulation?—Well, when these coins are returned that bear signs of sweating to the Mint we do not receive them. A sweated coin, so long as we can detect that they have been sweated, is no longer acceptable either to the Mint or in a treasury. It is not received at home; if they see any signs of sweating on a sovereign the sovereign is cut and returned to you.

1733. So that those sovereigns will cease to be legal tender the minute they have undergone sweating?—That is so, Sir. The only thing is so many of them escape detection.

1734. But would a person in India accept a sweated coin when he knows?—No, he would not if he knew. They are very careful about it themselves.

1735. So that it is conceivable in a very short time the whole of the gold put in circulation would be of a character that would be unacceptable to a person as a medium of exchange?—That possibility might occur; yes.

1736. Now then, to go back to the actual loss this would produce. Supposing we have 200 crores, that is equivalent to 150 million sovereigns. At the rate of 6d. per sovereign that would be equal to $3\frac{3}{4}$ million pounds sterling?—I have not verified that.

1737. Well it is 150 milion sovereigns at 6d. per piece. That is, 3 million 750 thousand pounds and that would be the loss?—Yes.

1738. Therefore one has to contemplate the possibility of that loss being incurred and on top of that of the coins being really demonetised for the reason that they are no longer of standard value?—Yes.

1739. So that if we continue the argument, having put 200 crores into circulation, that 200 crores within a comparatively short time may become useless as a medium of exchange?—It is possible it might be. I could not expect it would occur, but it is possible that it might. I think the deterrent effect of refusing to accept coins at their face value or to accept them at all if they bear any signs of sweating would make people so careful that the sweaters would be discouraged to a certain extent.

1740. Admitting that was so, every gold coin would have reached practically the lower limit of weight?—Yes.

1741. So that if the sovereigns came back from circulation and were brought back to the Mint they would have to be recoined?—There would be a loss of approximately 2 per cent.

1742. And if that process were to be repeated, say, every 5 years, you can reckon that your cost will be roughly speaking what we have put down there, at $3\frac{3}{4}$ million for sweating and on top of that 2 per cent. for recoinage?—No, the cost of recoinage is not 2 per cent.; that is the loss limit.

1743. Including sweating?—Yes.

1744. That would be roughly £3,000,000 sterling.

1745. (*Chairman.*) What is the cost of recoinage?—The cost is practically identical with the cost of new coinage and may be taken at ·15 per cent., which is the actual cost of coinage, assuming that your overheads are properly divided owing to continuous work or an average amount of work. Overheads are so important that unless you average the work your cost may work to enormous figures if you are on slack work.

1746. (*Sir Rajendranath Mookerjee.*) Is it your experience all these years as Mint Master that the coin is reduced by 6d. through sweating or 2 per cent. on the whole?—Not all coins. Those coins which have been sweated and come to us in practically new condition are found to have lost just less than the limit allowed of 2 per cent.

1747. On your assertion, on the whole, as Sir Henry Strakosch put to you, in a few years' time there will be a tremendous loss to the country?—That is to say, if they sweat every coin that issues; but I cannot imagine that that would occur.

1748. It has never occurred before in the case of sovereigns?—In consignments of sovereigns from Singapore imported sometimes and paid to Government we have found every single sovereign sweated.

1749. It may presumably have come from the East.

1750. And the coins which come from India to you again?—Some are. Not all. The greater number of those that we know to have been only in use in India are not sweated but when we can trace a consignment from the Far East, we find practically all sweated.

1751. According to your theory if there should be a gold coin in India it very soon disappears?—I don't think very soon everything would disappear. But I am not in favour of a gold coinage for India or any other country in the world.

1752. That is what I was going to ask you. Have you any experience of other European countries about sweating or reducing of weight?—I think there is less sweating owing to the conditions in European countries. That there is sweating is undoubted. But it is visited with greater punishment when the crime is detected and consequently it is nothing like as common as it is in the East.

1753. Given a change of the Code here, do you think all that will disappear?—With advance I think that it will, yes; it should tend to disappear when people are more used to it.

1754. (*Sir Reginald Mant.*) I understood you to say just now that the people would become more cautious as the sweating increased and refuse to take coin, and that sweating would therefore be discouraged?—Yes.

1755. But did you not say that only an expert could detect that a coin had been sweated? How are the public to detect it?—It is not that the expert has any special knowledge but that he knows what to look for. I can tell at once if a coin has been sweated because I know what to look for and the public, once they find their coins rejected, will soon find out what to look for. We have had that occur in the case of rupees. We have had many rupees badly sweated and up to the limit; $6\frac{1}{4}$ per cent. I think is our limit for rupees and I have known rupees sweated right up to 6 and 1/8th per cent. But it is very clear and the public know and they can see these signs. It is known to shroffs and the knowledge filters down gradually through to the people. It is a case of education.

1756. You gave as your main reason for preferring an Indian coin to a sovereign the fact that the sovereign suffers more by wear and tear from legitimate use. But you said that the main danger was illicit treatment?—That is an argument against a gold coin in circulation at all.

1757. But does it not also diminish the strength of your preference for an Indian gold coin if the main danger is not legitimate wear and tear but illegal treatment?—Yes. It certainly does.

1758. Because I presume your special Indian coin would be equally liable to be sweated?—Yes. The only point there is that I hope that the sweating would diminish in time whereas the wear and tear cannot diminish.

1759. And another reason that you gave for preferring the Indian coin was that you cannot have the sovereign as legel tender unless it was exchangeable into an even number of rupees?—Yes. It would be very difficult to work on, on a long fraction or a long decimal of rupees.

1760. That is assuming that the present rate of 1s. 6d. is retained?—Or any other rate that did not include a 5 or a 0 as the last figure when converted into rupees. 5 or 0 should be the last figure. I think it would be very awkward to have Rs. 14 to the sovereign or even 16 as the Doctors have. It makes complications in conversion.

1761. What sort of complications?—Assuming that a man carries in his pocket four sovereigns; at Rs. 16 to the sovereign he has got Rs. 64 and it is not so easy as if it were Rs. 60 or Rs. 70 or some figure ending in a 0 or a 5. It does not fit in with our note denominations for instance. You would have no note, unless you go back to the one rupee note; you could not exchange a sovereign exactly against an even number of notes, if you had 14 or 16 to the sovereign or any figure except 15 or 20 or 10. It is merely a question of convenience but it would be very awkward to have a 12 rupee coin or a twelve rupee note. We should never dream of introducing a twelve rupee note.

1762. And you would rule out a proportion of 12 rupees to the sovereign on that account?—I think I should. I do not think it will be found at all convenient if the sovereign became a circulating medium.

1763. What about Rs. 12-8-0?—One is nearer that. But you will have to reintroduce my Rs. 2-8-0 note then.

1764. You get your factor of five?—Yes, when you have two sovereigns you could get Rs. 25; 12-8-0 would be more convenient than 12. Of course, it is purely a matter of calculation. Bankers and others will be able to say more on that point than I can say.

1765. (*Sir Reginald Mant.*) We are only discussing it from the point of view of currency.

1766. (*Sir Norcot Warren.*) What is the penalty for sweating in India?—I am afraid I cannot give the legal penalty. But very frequently what it amounts to is nothing.

1767. If the penalty were made very severe would it stop sweating?—If one could get convictions; it is a difficult thing to get a conviction. In fact I believe, in the eighteen years I have been in the Mint, I do not think we have been able to succeed in getting a conviction for sweating of silver.

1768. Why not?—It is very hard to bring it home and the difficulty is to get the Police to take a case up.

1769. (*Sir Alexander Murray.*) In 1918, when the 15 rupee Gold Mohur was put into circulation do you think we could draw any conclusion as to the preference shown by Indians for an Indian coin such as the Gold Mohur to the sovereign or any other gold coin in circulation?—No, certainly not. They merely took it as gold. They did not want coin in any sort then. All went straight into the melting pot so that it did not matter whether it was a sovereign or a gold mohur.

1770. The fact is that there was a prohibition in existence at the time on the importation of gold and therefore it was immaterial whether it was the English sovereign or the Gold Mohur? It would have been taken?—Any coin of any kind, francs and all gold coin of the world though prohibited from coming in did actually come in and went straight into the melting pot.

1771. It was immaterial whether it was an Indian or any other coin?—Absolutely.

1772. (*Sir Purshotamdas Thakurdas.*) If a rupee is presented that is too much worn out, don't you cut it and return it to the presentor?—So long as it has not lost more than $2\frac{1}{2}$ per cent. it is legal tender. Over $6\frac{1}{4}$ it is no longer legal tender.

1773. Supposing in view of the difficulty of getting convictions on what you call sweating, you did the same to the gold coin?—I said that it would be a great deterrent if people found that their coins on presentation were cut and returned to them because they had been sweated and worn beyond the limit; then they would say " this is not good enough. I have received this at Rs. 20 and now when I sell it to a bullion dealer in the bazaar I am only going to get Rs. 18-10-0 for it," and consequently that man will be more careful what he takes in future. He will look at the coins very closely and that in itself will be a deterrent to sweating.

1774. Could you tell us the difference between the loss on a cut rupee as compared with the loss on bullion value of sovereign?—It is very hard to say what that would be. It would depend so much on the man who held the coin after it was cut because he would then be forced to go into the bazaar and it would depend on his knowledge and powers of bargaining, how much he got for that.

1775. Supposing it happened to-day that a man was returned a rupee cut into two and he had to sell it at its bullion value and a man who has a sovereign worth Rs. 13-5-0 similarly has the sovereign cut and returned to him, what would be the difference between the values that he would get on his gold coin as compared with the silver coin?—He would get in each case probably something rather below the bullion value of the silver or gold as the case may be.

1776. How much below?—That, as I said, depends very much on the status and knowledge of the man holding it; and an ignorant ryot would probably get very much below.

1777. What is the best that a man, say, in Bombay or Calcutta might get?—With one sovereign cut he would not get very much.

1778. What would be the loss?—You know more than I do about that. I think the loss would be very considerable but I could not fix any figure.

1779. (*Sir Purshotamdas Thakurdas.*) Could Col. Willis give us a table working it out on the basis of the rates to-day?

1780. (*Chairman.*) Is it possible to work it out arithmetically?—It is possible to say what the bullion value of a sovereign which has just lost weight is. But it is not possible to say what the holder of a cut sovereign would get in the bazaar.

1781. (*Sir Purshotamdas Thakurdas.*) If you could tell us what the bullion value of it is to-day then if a man does not do equally well it is because he has not got either the facility or the knowledge?—He loses just over two per cent.

1782. (*Chairman.*) What is the capacity of the two mints for gold or silver coinage?—Can you give us the figures?—Neither of the mints has any specified capacity for gold coinage naturally since India has no gold coinage. Actually for silver coinage each mint is capable of coining six lakhs of rupees a day and they are designed for between 2 and 3 lakhs of pieces of subsidiary coinage but actually both of them can do more than that in a normal working day. There is no reason except wear and tear of the supervising staff why those figures should not be multiplied by two by working double shift.

1783. Both as regards rupees and subsidiary coinage?—Yes. The Bombay Mint actually put out 16 lakhs of rupees a day together with 6 lakhs of pieces of subsidiary coinage.

1784. To summarise, what is the total maximum capacity under pressure of both Mints for putting out rupees?—In rupees it is safe to say that they can continue to put out 25 lakhs of rupees a day, the two together; that 16 lakhs, we did under enormous pressure and I do not recommend it as a figure for continued working.

1785. I wanted to ascertain how much of the busy season demand could be met by fresh coinage after the demand had declared itself. The question I want to direct your attention to is this. Taking the beginning of the busy season, say, in December, and supposing that the purchase of silver began at once, then the silver would arrive before the end of January, I imagine?—Probably. It depends somewhat on where it came from.

1786. Supposing the demand continues till the end of the busy season, that would be, say, up to April?—Yes.

1787. On the supposition that there was an unforeseen demand for rupees that arose at the beginning of the busy season and the purchase of silver began at once, how much of the rupee demands to the end of the busy season could be met by fresh coinage at the mint?—May I just work it out; taking the end of April as the end of the busy season .... and we must assume for that a demand for rupees, of the order which has been experienced in recent years......with the balance of uncoined silver which the mints always have, they would presumably start to work on their average balance so that they could get to work a few days before the silver has arrived. The two mints are capable of producing 100 crores in that time. In time of pressure we work every day including Christmas day, and we did that for two years which will be more than adequate to meet any demand.

1788. You think 100 crores in three months is more than adequate to meet any demand experienced for additional rupees during the busy season?—Yes, I think there would be some difficulty in getting the silver here in time. I beg your pardon it is not 100 crores. I meant 25 crores in three months.

1789. Then 25 crores will be adequate to meet such exceptional demands as are likely to occur?—That I am afraid, Sir, I am not qualified to answer. May I say, Sir, that that includes at the same time the normal coinage of subsidiary coin which also goes up to a certain extent in these times of pressure, but if the subsidiary coin balances were sufficient, that 25 crores could be increased.

1790. (*Sir Reginald Mant.*) In giving the estimate of 25 crores you have allowed practically for three months coinage out of the four?—Yes, three complete months for coinage I have allowed and actual starting before our first shipments arrive because we carry balances in the mint which would allow us to get going.

1791. But do you think that a demand of that extent is likely to come so suddenly that you would not have made any anticipatory purchases of silver?—I am merely giving technical evidence here. I am supposed to know nothing of the purchase arrangements.

1792. Assuming that the authorities responsible for expanding the coinage had foreseen the demand and ordered silver in advance, you could then start earlier?—Yes.

1793. And if you coin for the whole four months, you could turn out another 5 or 6 crores?—Yes, certainly.

1794. (*Sir Henry Strakosch.*) May I ask a question? I am rather ignorant of the arrangements here. There are two mints in India, one at Bombay, one at Calcutta, and they are of equal capacity, I think?—Practically.

1795. You have told us that at one time under great pressure you have turned out 16 lakhs per day in Bombay?—Yes, and 6 lakhs of subsidiary coins.

1796. I take it that at great pressure it would be possible to turn out the same amount of rupee coin and subsidiary coin at Calcutta?—I am not quite sure about that. I have been in charge of both the mints and I should prefer to say that I think Calcutta's absolute record is 2,100,000 coins in a day and Bombay's is 2,250,000, there is not really much in it.

1797. That is on a double shift?—Yes, two 10-hour shifts.

1798. For how long could you go on running a double shift?—We went on for many weeks, but the result was, the men had so much money at the end of the time that we had a big strike, and I think if we had to go on much longer (luckily they only struck just when the pressure came off), there would have been serious trouble and I would not blame them. I wanted to strike myself.

1799. But in a real emergency it would be possible to coin under those circumstances 32 lakhs a day and possibly even more if the demand for subsidiary coin were less intense than the demand for rupees?—Yes, but I do not think labour would stand that very long. It is such an enormous strain.

1800. For how long do you think you can conveniently run?—I should not like to try it for longer than a fortnight at that rate.

1801. (*Chairman.*) Let me put it to you in this way. You have been responsible as technical adviser in regard to the supply of coins to the authorities. Supposing you were asked your technical advice as to whether, in view of the possibility during the busy season of an additional demand for 25 crores of rupees, you would advise that it was prudent to leave the supply of that demand to be met entirely after the demand had begun or whether you would advise that it is prudent, in view of the technical situation, to make provision beforehand so as not to have to make the whole provision including the purchase of silver after the commencement of the demand, what would be your advice to the authorities on that point?—I should certainly advise some anticipatory action in that respect to get some silver at least and also that coinage of the existing stocks of bullion should begin at once in the mints. It takes a little while to work up to full pressure. You cannot suddenly say "To-morrow we will start turning out 12 lakhs of rupees." You have first of all to get all your departments full so that you have sufficient stocks in each department to avoid any stoppages waiting for earlier departments. It takes, roughly speaking, to do the thing properly 10 days to get them into full swing. That would be done from our balances of bullion which we always hold in the mints, bullion under coinage or silver rupees under recoinage.

1802. It appears then you would probably say "I can do it, but in view of labour possibilities I would recommend you to have something in hand"?—Yes, Sir.

1803. (*Sir Alexander Murray.*) In 1918, is it not the case that you were actually turning out about 42 crores of rupees, and about the same amount again in 1919?—I believe you have the figures in the Currency Report. I am prepared to accept them.

1804. It shows you can maintain a high standard of output for some time?—Yes.

1805. (*Chairman.*) We have dealt with the question of the popular preference as between a separate coin for India and a sovereign. Now I want to ask you whether your experience enables you to express any view as to the preference of the Indian public as between the use of gold and silver coin for purposes for which either of those two may be used in circulation?—I think that since the majority of the people of India do not ordinarily have use for such a large unit of value as any gold coin which we could give them, the circulation of gold coins outside the big towns is not likely ever to be very big. Of course, I have seen periods when gold was in circulation to a certain extent and I understand that in the Punjab it was very largely in circulation. In Bombay and Calcutta I have been tendered sovereigns and half-sovereigns, but they were very rare things and the Indians were always prepared to take them and very often were prepared to give them during those short periods. But I do not think that we have any real data which could prove the popularity of the coin—of the one coin as against the other. The silver coin is the more convenient to the greater number of the people in the country.

1806. Does your memory of Indian conditions reach as far back as the times of the Report of the Fowler Committee—I think it was in 1898?—Oh, no; I started in India in 1900. Of course, I have read it.

1807. You have not any practical acquaintance with the effort to encourage a gold circulation made

after the report of the Fowler Committee?—I am afraid not. Those were my first years in India while I was still soldiering and I did not really take much notice.

1808. Then the effect of your answer, as I understand it, is that there has not been any evidence that the public is inclined to consider the use of gold as a convenience for the larger payments?—No, I think there has been no evidence of that. As regards larger payments, I understand that in the Punjab and elsewhere it has been used as a medium of exchange in large quantities, but it has never been what one would call a circulating coin.

1809. (*Sir Reginald Mant.*) That gold that went into the Punjab may have circulated for a very short time, but it soon disappeared, did it not?—Well, it was just before the war conditions came on. But I understand that in the few years just before the war there was an extension of the use of gold for payments.

1810. It disappeared as soon as the supply ceased?—Yes, and owing to the conditions regarding gold generally in the war time.

1811. But as soon as people found they could not get more sovereigns, they hid away the ones they had got?—Yes.

1812. (*Chairman.*) Now, proceeding from that, from your knowledge of the demand for currency and so on, what would be the effect on the general public and their habits and requirements as regards currency, of declaring the rupee to be no longer unlimited legal tender and introducing at the same time a gold currency?—I think that gold would probably displace all but very small hoards of rupees and small reserves of rupees for emergent use, whether gold coin or gold bullion.

1813. You distinguish, I imagine, between hoards and reserves in the sense that a hoard is something which is put by more or less permanently and a reserve is a sum which is held to cover as it were fluctuations and unforeseen expenditure?—Yes, that is the way I look at it. The gold might also displace notes held in hoard. I know that hoards are so held and it is possible that it might displace them but I am not sure that that would occur. The notes being payable in gold, I think that a large number at least would continue to be held in hoard. As I have already said, I do not think that the gold would enter much into the real circulation of the country.

1814. You referred to note hoards. Is it a practice to hoard notes at all—is the practice widespread?—I cannot say how widespread it is. I know of cases of people locking up notes for a long time. I can give one example of a man who locked up two thousand-pound notes of the Bank of England and they were produced to me in 1922, and an inquiry was made by the bank where they were presented whether they were genuine because they were long past dated and they were yellow. They were two notes that Queen Victoria had given to her munshi when he retired from her service I think in 1891 and they descended to his widow. On the death of his widow they were presented to the bank. So that that was a very obvious instance of hoarding. But I was thinking really of such a hoard as the Nepal Government had when they returned to us a large number of 1835 rupees. This I think was about the year 1912. They were returned to the Calcutta Mint and we purchased them from them for gold and currency notes. That was a case of alteration of the form only—the hoard was held.

1815. Amongst the general public do you think there is any tendency to hoard notes?—I think that since they have discovered that notes can be adequately protected in tin boxes from the white ant and the rat, I think they have discovered that for some purposes they are a convenient form of hoarding.

1816. Do you believe that improving the facilities for obtaining gold for these notes would tend to bring these hoards out?—I do not think so. I do not think it would do that. So long as they knew that they would be paid in gold for their notes I do not think it would draw them out. Probably at the start, yes, but very soon they would settle down. They would try to see whether they could get gold for notes and when they found that they could, they would be to a certain extent indifferent unless they wanted gold for specific purposes.

1817. You say there would be a certain replacement of silver hoards by gold?—I think that there would be a tendency to that on a very large scale.

1818. Do you contemplate that the process might be even on so large a scale as to be complete, so that all silver hoards would be replaced by gold?—Well, it is difficult to say that because hoards go right down even among the very poor. There might be quite a considerable lot held in small quantities which did not amount to a twenty rupee gold piece. I mean there is such a thing as a hoard of 10 rupees, and there must be a very considerable amount held in these small hoards. Everybody has buried away in a hut somewhere a small pot with a few rupees in it which is more or less sacred.

1819. Now as regards large hoards?—My opinion is that they would tend to be replaced entirely by gold.

1820. As regards circulation, I understand your opinion is that there would be no large demand for gold to replace these rupees in circulation?—I do not think so. It is purely a matter of opinion. That is my opinion.

1821. (*Sir Henry Strakosch.*) May I ask what is the estimated total amount of rupee coin which would be necessary to form the subsidiary coin of the country when gold is put into circulation?—It is very difficult to say because we do not really know what is the total amount of rupee coin required now. My own opinion is that it would differ very slightly from whatever the present figure is.

1822. Could you tell us what the requirements of a token coin of that character would be per head of population? Would that be helpful?—Well the only thing I can do is to make the guess of Rs. 5. That seems to me to be a very reasonable figure to take. There are so many to whom Rs. 5 would be a very big sum and on the other hand there are townspeople to whom Rs. 5 is so little.

1823. You think Rs. 5 per head of population would be a reasonable figure for the total circulation necessary to carry on the trade of the country as a subsidiary coin?—It seems to me that that would be a reasonable assumption.

1824. That would be about 150 crores?—Rather over it now-a-days.

1825. (*Sir Reginald Mant.*) You said that if gold coin were put into circulation you thought that it would replace silver in all the large hoards?—Yes.

1826. Is not that process taking place now?—There is a large amount of gold coming into the country. There were very large imports last year. Do you consider that a lot of these imports went into hoards in replacement of silver?—It cannot be in replacement of silver for the country as a whole because there has been no corresponding efflux of silver. Therefore the two are now lying side by side. The silver is still lying in hoards.

1827. You mean efflux from the country? But has there not been a decrease in the demand?—In the purchase, yes.

1828. No, in the demand for silver, in the absorption of rupees?—I see. I was thinking of silver bullion. Yes, that is so. It has been bought presumably with the rupees which have returned to us in reserves.

1829. But there has been a decrease in the absorption of rupees?—Yes.

1830. And an increase in the absorption of gold?—Yes.

1831. Does not that point to replacement of rupees in hoards by gold?—Yes, distinctly.

1832. And do you think that process is likely to continue? Supposing Government does not put gold

into circulation. Is it not likely that the hoards of rupees will gradually be replaced by gold imported through ordinary channels?—I think it is, certainly. They may always retain some rupees; but the bulk is likely to go into gold.

1833. So that the adoption of gold currency would only accelerate the process which in your opinion is otherwise inevitable?—Yes. May I correct that last answer? I do not think that it could accelerate it; because I do not think that Government can put gold currency into the country at a greater rate than they are now importing gold bar, so that it could not be any question of acceleration. Government could not put in a gold currency surely at the rate that the country is buying gold for the last few years.

1834. (*Sir Henry Strakosch.*) Could it not happen that gold coins are put into circulation and the import of gold continues at the same rate?—I think it would rather strain the resources of the world to produce the gold.

1835. (*Chairman.*) These matters are peculiarly, I imagine, within your knowledge—the total issue of silver currency, the total amount melted down by the Government and so forth?—Yes.

1836. Taking such aids to an estimate into account, have you ever considered whether it is possible to arrive at any approximate estimate by that method of the total amount of rupees respectively in hoards and in circulation at the present day?—It is extremely difficult owing to the difficulty to make any real good estimate of what has been melted down.

1837. Privately?—Privately, yes. That is the crux. We cannot say how much has been melted down. I think one is safe in saying that the amount still remaining of the rupees that we have coined is under 400 crores. I do not think it could possibly be over and I expect that if we could get a true census it would be less. But it is all of the nature of a guess. I have worked the figures in every way I can think of and I am never satisfied with the results I arrive at as being accurate. My results lead me to think that there is something considerably less than 400 crores; but I am not prepared to vouch for any figure.

1838. Then you have to start at the other end and say there must be about 150 crores in circulation, taking Rs. 5 per head?—Yes.

1839. And that would leave a figure, by a process of elimination, of something like 250 crores held in hoards and reserves?—My opinion is that it is less than 250 crores. I give it as the absolute figure. But I do not think it is so much.

1840. Something between 200 and 250?—I should prefer really 200 as safer.

1841. (*Secretary.*) 90 crores in the Government Reserve.

1842. (*Chairman.*) The Secretary reminds us of the 90 crores in the Government reserve?—My estimate of 400 includes the 90 crores.

1843. That would leave a figure of round about 150 as a maximum for hoards?—Yes; say 100 to 150.

1844. You are satisfied that it is not really possible to arrive at any more accurate estimate?—I cannot think of any method of arriving at an accurate figure.

1845. Except by such light as might be thrown on the situation by the rupee census?—It is apt to be misleading. The rupee census is undoubtedly wrong, unavoidably wrong. The same hoard that I was speaking of, that came back in 1912 contained—I am speaking purely from memory—two crores of 1835 rupees which vitiated all calculations made from the census.

1846. You say that it is an impossibility?—Yes. A great many more 1835 and 1840 rupees have come back to be melted at the mints than there could possibly be according to the figures arrived at by the rupee census. On the other hand, I think there has been, especially during the war time, much more modern coin melted down than has ever been taken into account by the rupee census.

1847. Where, then, you can test the census by ascertained facts, you discover discrepancies which teach you to view the results with caution?—Yes; any figures derived from that must be a very rough approximation.

1848. (*Sir Henry Strakosch.*) I should like to ask, do I understand you correctly to say that the census taken of rupees is misleading because it is conceivable and that to exaggerate, the whole of one year's issue of rupees may be in one hoard and remain there and therefore no coins of that issue may appear in the census of rupees and to that extent the census would be vitiated?—Yes.

1849. And is it the habit of the people who hoard in big amounts to take a big lump of rupees of one particular issue?—That is what we found; because they always like, in these big hoards, to get hold of new rupees and therefore they are naturally of one issue.

1850. Could you from the information you have estimate to what extent the error would have to be corrected by the ordinary mint census?—I am afraid I cannot make any suggestion. I quite failed to find any possible way of getting a figure. I have often tried. It must in the nature of things be guess-work.

1851. (*Prof. Coyajee.*) But such hoards as those are exceedingly few. Are they such as would trench materially on any particular issue?—There are a good many other large hoards that we know of besides. There are other big Indian States which were known to have had large rupee hoards.

1852. Is it not that industrial investment is taking up so many of the hoards?—I am not prepared to agree that industrial investment has touched any of those big hoards. It may have; but I cannot say.

1853. (*Chairman.*) You have no better information or statistics available as to the big hoards in the Native States than in the other case?—No. It is largely hearsay, and sometimes one gets actual facts and one does not know what becomes of a hoard afterwards, so that it is never safe.

1854. (*Sir Henry Strakosch.*) In view of what you said just now, is it correct to say that the census figures are more likely to be an under-estimate than an over-estimate?—No, I do not think so.

1855. Owing to the exclusion of a particular issue which may be in hoards?—No; I do not think one can say that. Possibly because it merely vitiates the figures as compared between one year and another, I do not think it vitiates necessarily the figures as a whole. One may draw certain deductions from these figures. But the other factor, the melting factor, is a very big one. We may say that the censors are wrong from two points of view, one that they do not allow for hoards and another they do not sufficiently provide for melting; and those errors may cancel each other or both may be working in the same direction. It is not possible to say anything.

1856. (*Chairman.*) I want to ask you about the facilities to the general public for refining silver and gold at mints. Are those facilities adequate at the present time?—There are no facilities whatever for refining silver. The gold refinery in Bombay is adequate. There is no gold refinery in Calcutta.

1857. There is no gold refinery in Calcutta and there is a gold refinery in Bombay which is adequate?—Yes, and we have not been pressed to put one down in Calcutta at all.

1858. And there is no silver refinery at all?—No. Such refining as is now done in the mints is by crude methods only adopted for emergencies in small amounts.

1859. Is there any demand for a gold refinery in Calcutta?—I know of none. It has of course been suggested, whether in a half-hearted way or not I can't say, but there has been no real demand, and that of Bombay is adequate to any demand that has been laid upon it.

1860. What is the position regarding a Government refinery for silver?—There has been some demand in Bombay; and, of course, in the war time we were forced to refine a certain amount of silver that came. But we had to do it in a bad and expensive way because we had no facilities. The Bombay market frequently talks about the need for a Government refinery for silver. I do not think there has been any demand in Calcutta, but I am not quite sure.

1861. Silver refining is at present done in the country by private firms?—Yes, by the old and crude method of lead refining, which is unhealthy and costly.

1862. Would you yourself advocate any extension of the facilities for refining either of gold or, particularly, of silver?—I think it would depend entirely on the demand of the public. You are speaking now, Sir, of the refining of any of our own rupees that may come back to us, or anything like that, when asking whether the Mint should increase their refining capacity?

1863. At the present moment I am dealing with the operations conducted on behalf of the Government?—I should be inclined to give the Bombay merchants what they want if they really want a silver refinery, a Government silver refinery, where they can have their bars refined, assayed and marked. I should be inclined to give it to them. At present they refine outside and bring their bars in to be assayed, which frequently means melting beforehand, so that it increases the cost of refined silver in the Bombay market, country-refined silver. Refining silver is done by much cheaper methods elsewhere.

1864. And you look upon that as work which might reasonably be done for the convenience of the public, if any private firm is prepared to put down a refinery?—There is no reason why a private firm should not put down a refinery, except that they would have to come to us for some years, at any rate, to get the fineness marked on the bars. That eventually would disappear just as it has in the case of refineries at home where certain fineness marks are accepted all over the world. We accept on silver certain marks as we know by experience certain assayers of refineries at home. We accept their finenesses; we do not accept all finenesses.

1865. And not at present any Indian?—No, they do not mark their bars; they bring them to the mint to be marked.

1866. (*Sir Maneckji Dadabhoy.*) What would be the cost of setting up a silver refinery?—May I please answer that not quite directly by saying that the cost of refining silver in fine ounces would amount to ·13 of an anna in a refinery—that allows no profits I may say—that is, with overhead charges, interest, depreciation and working costs, the cost would be ·13 of an anna including inevitable losses incurred in refining. That is in the case of a refinery of a reasonable size, not a very small one but a fairly large refinery.

1867. What do you base this estimate on?—I base this estimate on figures of the Denver, Colorado and Ottawa mints. Unfortunately the figures at my disposal are mostly pre-War. Neither of the mints concerned issue such detailed reports as they did before the War. I know there have been considerable developments and very much cheapening in the processes since, but I have not the details of them and have not been able to obtain them yet. This is an estimate based on pre-War practice, not on pre-War prices.

1868. If a refinery is started by private individuals, they would all the same have to come to Government?—At present, yes, until their own hall-mark became known.

1869. (*Chairman.*) You contemplate no doubt that if the Government is to undertake the work of refining for the public, the Government silver refineries should be made self-supporting?—Yes.

1870. And that an adequate charge should be made to cover the cost of the establishment?—As in the case of the cost of refining gold where we are making a profit. Gold refining is, of course, more costly than silver refining and the Government makes a profit out of the gold refinery part of the mint.

1871. (*Sir Purshotamdas Thakurdas.*) I think you said that you recommend complying with the feeling prevailing in Bombay for a Government silver refinery. Do you think they can give the Mint enough work to make it self-supporting?—I am not sure. Of course, in the old days when famine used to bring out silver in enormous quantities, it would have been very advantageous, but we do not now have all those waves of silver ornaments and so on coming to the Mint as they used to do in the old days.

1872. Your feeling mentioned just now that Government might comply with it is based on any calculation as to whether the thing would be paying or not?—Not as to the quantities. Here bullion brokers and people dealing in the silver market of Bombay are much more qualified to express an opinion as to what would be the quantities.

1873. What would it cost if a silver refinery were added to the Mint at present?—That depends, of course, very much on what scale the refining is done. On the assumption of large scale refining my capital cost is 6 lakhs and the working cost, including the value of all recoveries and so on, $2\frac{3}{4}$ lakhs. That is for a large refinery, probably larger than would be required, I should say for an expenditure of 5 lakhs one would be able to provide one for the public.

1874. For a monthly expenditure of how much if you reduce the capital by one lakh?—I should be inclined to reduce the working expenses by the same amount because the interest on capital and the depreciation which is considerable in the case of refining plants form the bulk of the annual expenses.

1875. (*Chairman.*) We find in the Report of the Controller of the Currency certain particulars as regards the counterfeiting of rupees, prosecutions of counterfeiters and so on. This is no doubt a matter with which you are specially acquainted. Is there any increase of that trouble in the country?—It is difficult to give a definite answer to that, but I think, with the spread of education it is a decreasing trouble. It is not likely to increase. The people are better able to detect the true from the false, and as they become more educated it would be still more difficult for the forger to get away.

1876. If they become more educated they become more skilled forgers?—There is a point beyond which you cannot go without putting more work into it than the coin is worth. It does not pay you to put a great deal of work into a counterfeit coin of the value of one rupee.

1877. It follows then that the temptation to counterfeiting has increased as the bullion value of the rupee has diminished? If the bullion value of the rupee were to be diminished, would not that increase the temptation to counterfeiting?—I do not think it would very much, because the counterfeiter expects such an enormous margin between his actual costs and the return he gets to make up to him for the risk of punishment. If we lowered it right down to 50 per cent. silver or some figure like that, then I should say there would be a great danger of forgery increasing as he would probably make it out of the proper metal and then it would not be possible to detect forgery at all.

1878. So that the temptation would reach its maximum were some base metal coin substituted for the rupee?—That is exactly what happened in the case of the 8 anna bit; there we used a cupro-nickel coin and forgery at once became rife. There was a high value coin of base metal and they went for it.

1879. But that has led to the recalling of the 8 anna nickel coin?—Yes.

1880. There is, I believe, fairly extensive counterfeiting even of the minor values of base metal

coinage?—Yes. It is very inferior and easily detected but sufficient to impose on the man who is in a hurry or the more uneducated.

1881. So that in general the danger of counterfeiting would have to be seriously considered if there were any proposal for the substitution of a base metal coin for the rupee?—Yes. I am afraid that would make it impossible to really consider it. The danger would be so great.

1882. (*Sir Henry Strakosch.*) It would not include nickel coins because of the difficulty of coining them?—The trouble is that nickel is very easily imitated—the colour and so on, by various alloys. So that nickel is not really a very safe metal from that point of view. It is difficult to coin, bnt they would not attempt to coin nickel; they would make an alloy of the same colour and the same specific gravity, so there is no possible test by weighing it in your hand.

1883. (*Chairman.*) Are you acquainted with the criminal law as regards counterfeiting?—The details of it? No. I cannot give you the penalties.

1884. You are not prepared to express an opinion as to whether it is efficient or sufficiently deterrent?—I think the law in itself is a sufficient deterrent. The powers under the law are sufficiently deterrent but they are so leniently interpreted in most places that the culprit does not get sufficient imprisonment.

1885. Finally, as regards the questions which I wanted to ask you, in the course of one of your answers you expressed an opinion to the effect that you are opposed to a gold coinage for India. May I ask whether when you expressed that opinion you were thinking of general considerations or whether there were any further technical considerations at the back of your mind?—I think when I said that, Sir, I qualified it by saying I was opposed to gold coinage for any country in the world. It is merely because I am opposed to gold as a circulating medium; it is so wasteful.

1886. Then that opinion was really based at the time in your mind on general considerations as regards the best system of currency?—Yes, on general considerations.

1887. Are there any further technical considerations as regards the advantages or disadvantages of a gold currency which it would be possible for you to advance for the assistance of the Commission?—No, I do not think I have any other points to make. I have made them all on the technical side.

1888. (*Sir Maneckji Dadabhoy.*) Almost all the leading countries in the world have now accepted a gold currency, have they not?—The gold standard?

1889. Yes?—They are not quite the same thing.

1890. I know they are not quite the same thing, but now gold coinage is a feature of many civilised countries?—No, I do not think I am prepared to accept that.

1891. What countries, would you say, are excluded from gold coinage?—It would be shorter to give those that are included. When we get outside the United States we do not get any other country in which there is an effective gold currency. The gold may exist in the form of a coin in treasuries and so on, but it does not circulate.

1892. Have you got any suggestions to make or do you entertain any apprehensions regarding the real impediments to circulation in this country?—Once the demand for gold in hoard is satisfied, if ever, there is no reason why a gold coin should not circulate to a limited extent, to such extent as the people find convenient. I am not able to suggest to what extent the people will find it convenient to use a gold currency. It could only be a pure guess, I am afraid, as to how far they would find it convenient. If they find it convenient then they will come to the Mint with their gold and have it coined into gold currency. If they do not want it, then they won't bring it. It appears to me to be automatic once the demand for gold for hoard is satisfied.

1893. (*Sir Reginald Mant.*) Colonel Willis, you say you do not advocate a gold currency for India. Do you advocate the removal of the legal tender character of the sovereign?—I do not know that it would make any difference at all. I should not be prepared to advocate it, but I do not think it matters.

1894. At present it does not of course matter, because the sovereign is valued at Rs. 10; it is undervalued; but that of course could not remain on the statute-book, unless the Rs. 10 ratio were to remain. The law would have to be amended, if the Rs. 10 ratio were abandoned. But would you substitute another ratio or would you demonetize the sovereign, assuming that another gold coin is put into circulation in its place?—It is rather difficult to answer that.

1895. (*Chairman.*) That is, assuming also the continuance of the present standard?

1896. (*Sir Reginald Mant.*) No, Sir, I am not assuming that. I am assuming that we abandon the Rs. 10 ratio and leave it an open question as to what the future rate will be.

1897. (*Chairman.*) Yes, but assuming an exchange standard.

1898. (*Sir Reginald Mant.*) Yes, a gold exchange standard.—(*Colonel Willis.*) I think it is really immaterial whether you demonetize or make it legal tender at the new rate. I do not think it really matters.

1899. (*Chairman.*) The Commission is very much obliged to you, Colonel Willis, for your evidence to-day.

(*The witness withdrew.*)

SEVENTH DAY.

Wednesday, December 2nd, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.

Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E. } (*Secretaries*).
Mr. G. H. BAXTER.

Dr. PRAPHULLACHANDRA BASU called and examined.

1900. (*Chairman.*) I understand that you are a Doctor of Philosophy and Economic Science and Vice-Principal of the Holkar College, Indore?—Yes.

1901. Since when have you occupied that position?—It is about eight years since I have been there.

1902. And before that?—I was a lecturer in economics and history in the Calcutta University.

1903. The Commission has had the advantage of a very full memorandum* from you for which we are obliged to you. I will now, if I may, ask you a few general questions in order to bring out the principal points in your memorandum, both to ascertain the precise emphasis which you lay upon various considerations and in order to elucidate any matters that seem to require further elucidation. I understand in general it is your view that the ideal to be aimed at is the establishment of an international gold exchange standard, but that pending the realisation of that ideal you propose that India should take steps to establish a gold exchange standard of its own?—Yes. My idea is to go back to the position where India was up to 1914 and strengthen the currency by having a very big gold reserve. My idea is that just for the present we should try to re-establish the Indian currency as it was up to 1914, and for that purpose try to build up our gold standard reserve.

1904. I gather then that the system which you propose is one which is in several essentials similar to that which was in use in India down to 1914?—Yes.

1905. As regards one proposed improvement, you suggest an increase in the gold standard reserve?—Yes. And another suggestion which I have made is that the exchange reserve should be entirely separated from any other reserve.

1906. If you please, I will take that a little later. You state in your memorandum that, in your view, the system in force in India down to 1914 worked well and economically?—Yes, that is my view.

1907. On the other hand, you propose that the future system should be a gold exchange standard rather than a sterling exchange standard?—Yes.

1908. Can you briefly indicate what are the reasons which suggest to you the change from a system which, as you say elsewhere, has worked well and economically?—I would not call it exactly a change. Up to 1914 sterling was also equivalent to gold. So, when our currency was fixed in terms of sterling, it was really fixed in terms of gold. But then during the war when the sterling diverged from gold, then we had our difficulties. So, in order to avoid any such difficulties in future when sterling may diverge from gold, I would like to fix our currency in terms of gold rather than in terms of sterling.

* Appendix 12.

1909. You look upon it as a possibility which has to be taken into serious practical account that sterling might once more become divorced from gold?—If it is not divorced from gold, then there is no harm in fixing our currency in terms of gold because it will be fixed in terms of sterling also. So by bringing about that change, if sterling does not diverge from gold, then I should think that we are not making any change at all, whereas if sterling is divorced from gold then we shall be fixing our standard in terms of a stable currency rather than one which may diverge from gold.

1910. I understand that in one part of your memorandum you suggest the substitution of gold bills for sterling bills in settlement of India's international account. Will you, in the first place, describe a little more in detail what the nature of the gold bill would be, and how this mechanism of gold bills would work?—Against the reserve that India has kept abroad, India will draw bills in terms of gold, and the suggestion that I have made, therefore, was meant to be applicable specially at this time, when sterling is not equivalent to gold, and, therefore, if gold bills are drawn in India against our gold reserve, and then when this gold bill reaches England this will really supply in England gold bills drawn upon other countries. I was thinking at that time of the United States, which is at present the only country which has got a gold currency. If such bills are supplied in the English market as a result of export from India to England, that is by increasing the supply of gold bills in England on America, it will thereby bring the sterling nearer to the dollar.

1911. Who would your gold bill be drawn upon?—We could have accommodation in America if we had really a gold reserve. Our difficulty was that we had no gold reserve. It was invested in sterling. When we get our gold reserve as such then you could get accommodation anywhere in the world, and when India had a favourable trade balance greater we could draw bills on our gold reserve in America. This would also help to bring sterling towards the dollar. As a result of the breakdown, we had to depend upon the American cross rate. But India had absolutely no control over the cross rate, which was determined by the balance of trade between England and America. If we are dependent on any cross rate, we ought to have more influence over that rate, and if we can draw gold bills upon America then we could have some influence upon the dollar-sterling rate.

1912. Does the system then involve holding a part of the reserves in the United States?—That is what we did during the war. The Secretary of State borrowed money in America, and for some time bills were actually drawn on America.

1913. Is that what you propose should be the new practice under your proposal?—That is what I have suggested: that our gold reserve should be dispersed in several countries till the time when the international system is so developed that gold in one place can secure accommodation in any other country.

1914. We live in a world where peace between the nations is not at any rate absolutely secure. Do you see any political danger of the demobilisation of reserves at a time when they may be most wanted if they are scattered in many foreign countries?—Of course, that is purely a political question; but unless there is such an international guarantee, as I have suggested here, it is impossible to work it.

1915. But, pending the time at which we may arrive at the ideal of an international guarantee, you would be prepared to take the risk of whatever political upheavals are involved?—Pending that I will keep the gold reserve in London, but in the form of gold so that it may be transferred from one centre to another if there is any necessity for it.

1916. As I understand it, then, your scheme as to the gold bill to be drawn upon reserves in various gold standard countries in one form or another really depends, as a condition precedent, upon the establishment of some international guarantee as to the sanctity of such reserves?—In the developed form in which I have advocated it here, it will be so.

1917. In your preference for a gold exchange standard system as compared with a sterling exchange standard, have you taken into consideration the proportion of India's trade which is done with sterling-using countries?—Yes, foreign trade with other than sterling-using countries suffers because of the fact that the rate of exchange is fixed in terms of sterling, and if India wants to develop trade outside the sterling-using countries, I think this will be a help, although not a very important help; drawing bills in terms of gold will be a help in developing India's trade in markets outside sterling-using countries. Of the sterling-using countries the most important, I suppose, is England barring that, our trade with the colonies is very small, almost insignificant.

1918. We have been told that as much as 90 per cent. of India's foreign trade is settled in sterling, even though it may be done directly with countries which are not sterling-using. Is it not probable that that would continue to be the case, even though the foreign trade of India with non-sterling-using countries were to be developed and increased?—Yes, that will be so; it is mainly because London is the monetary centre of the world: Bills drawn on London have a ready sale all over the world, and I do not think that will be disturbed in any way if we replace the sterling by gold. As I said so long as sterling and gold are the same, there would not be any change at all.

1919. You would not then view it as a consideration of important practical convenience that the definite link between the Indian currency and the standard should be with that currency in which so large a proportion of India's foreign trade is settled?—There is certainly an advantage in that, but the difficulty, as I pointed out, was that the sterling value went away from the value of gold and that created very great difficulties. This has, for example, brought about a very great influence of the American cross rate upon the Indian rate. This is not at all desirable unless we have some means of controlling that rate too.

1920. (*Sir Henry Strakosch.*) You say that the ideal to be aimed at is the system which was in operation in 1914. Then gold could be handed in and rupees received, but you could not receive gold on handing in rupees in unlimited quantities. Is not that a fact?—Unless the Government could do that the exchange system would break down: but the Government was doing that up to 1916.

1921. But there was no legal obligation on the part of the Government?—There was.

1922. To hand out gold for rupees?—To hand out rupees in the place of gold. Government used to take gold and hand out rupees.

1923. But it did not hand out gold under any statute in exchange for rupees?—Not under a statute, but if the Government wanted to maintain that standard, Government would have to do that, otherwise the exchange standard would break down.

1924. (*Chairman.*) I think Sir Henry Strakosch is asking you exactly what the system was before the war?—That is what I am describing. Before the war Government was not bound by any law to hand over gold in exchange for rupees, but Government practically in all cases whenever there was an adverse balance of trade was drawing reverse councils on the Secretary of State, which really means handing out gold for rupees. If the Government had at any time failed to hand out gold it would immediately mean a fall in the rate of exchange below 1s. 4d. The reverse council bill was really a support not to allow the 1s. 4d. rate to go down, just as council bills do not allow the rate to go above 1s. 4d. Therefore, although the Government was not legally bound to do so, Government was in all cases doing that, and whenever Government failed to do that it must mean the breakdown of the Government rate.

1925. (*Sir Henry Strakosch.*) Would you regard it as an improvement of the system if the Government was legally bound to give gold?—That, I suppose, I have suggested in my written memorandum. The Government should be made legally bound to give gold or, preferably, gold bills, because gold will not be in use within the country as currency.

1926. To that extent a modification of the system of 1914 would be necessary in your view?—Yes, there are several modifications which I have suggested; the most important modification will be to have a separate exchange reserve.

1927. (*Chairman.*) We will take that later.

1928. (*Sir Henry Strakosch.*) I am merely pointing out, with reference to your previous statement, that you regard the 1914 system as an ideal one that might possibly be improved?—Substantially the same system. The principle that was working up to 1914 I would accept.

1929. You suggested in one of your answers that sterling had not reached gold par. Are you aware that for the last two or three months sterling has reached gold par and has been maintained at parity with the dollar?—I would not call it exactly that sterling has reached that, unless that is maintained also in internal currency. England is probably a gold standard country, but so long as gold circulation within that country is not maintained at parity with the dollar I would not say that the old system has been brought back.

1930. Therefore you would say that England will not return to the effective gold standard unless gold were put into circulation in the country, is that your view?—Unless gold could be always available for purposes of export.

1931. But it is to-day? Gold is available for export?—So far as I understand the situation, gold is available for export only when the export is sanctioned.

1932. (*Chairman.*) I think Dr. Basu may be thinking of the circumstance that, until the end of this year, a licence is still technically necessary, although the Bank and the Government have declared that a licence will be granted in every case. Nevertheless, at the end of the year automatically even the necessity for a licence ceases?—Then it will exactly reach the old position.

1933. (*Sir Henry Strakosch.*) Then you would regard Great Britain as on an effective gold standard, although no gold is in circulation within the country?—This will be having the gold standard without a gold currency.

1934. You mention that the United States to-day is the only gold standard country. You are no

doubt aware that Great Britain is to-day, for all practical purposes, on a gold standard. The rest of the Dominions are, as also Holland, Sweden, Germany, Austria-Hungary. I believe I am correct in saying that the gold standard countries comprise countries with a population of about 160 or 170 million people to-day, apart from the United States of America?—That is, these are the countries which, theoretically, have a gold standard, and want to go back to the gold standard, but I do not think any of those countries has actually the gold standard in the sense that there is a gold currency also.

1935. No, but have they not returned to the gold exchange standard in the proper sense?—For external purposes they have got a gold standard.

1936. In fact, they have returned to a standard which you describe as the ideal standard?—Without really meaning to stick to that; that makes a good deal of difference. They have been forced into the gold exchange standard, but they do not want to be there.

1937. Why do you say that, when it is laid down in their statutes that they have to exchange their domestic currency for gold for export?—Every country dealing with a gold-using country will have to exchange its currency for gold; gold being the medium of international payment that is one thing, but it is another thing to deliberately accept a gold exchange standard and build up currency reserves for maintaining the currency exchange. As it is, none of these countries has got any exchange reserve as such.

1938. They have. If you look at the bank returns of all of them you will find that they have rather substantial gold exchange reserves?—That is not exactly earmarked for exchange purposes. As soon as the gold reserve is sufficiently big their idea is to convert the internal currency into gold, and not to retain the position which they are forced to retain at the present time; for example, the movement of Germany in having a gold currency and all other schemes like that, the ideal all along has been to return to gold currency and not to keep to the gold exchange standard.

1939. Do you, then, regard it as the final ideal that a country should have gold in circulation internally?—No. I do not think so. In fact, I think that it will be a wrong thing to have gold in circulation; that would be locking up so much of the national asset for merely providing the media of exchange, but then that is the ideal which has been kept before all the gold standard countries.

1940. Why do you, then, suggest that the countries in Europe who have now embraced the gold exchange standard will not have reached the proper gold exchange standard until they have put gold into circulation within their own countries?—I am afraid I have been misunderstood a little. I think I have not made my position clear. What I want to say is that those countries really want to be gold-using countries; they do not want to remain there. Just at present they have probably gold exchange standard without some of the essentials, namely, that there is no special permanent provision made in order to keep up the exchange rate. In fact, they have not fixed any exchange rate at all. Their ideal is to go to the gold currency system.

1941. I think you are mistaken. They have made provision; then statutes lay down at what price foreign gold exchange is to be bought and to be sold, which establishes the gold exchange standard?—I do not know; how do they maintain that rate?

1942. By their gold exchange reserves?—But their rate seems to fluctuate like anything, for example, the franc.

1943. France was not included among the countries which I have mentioned? May I ask you one other point? Would you regard it as an essential feature of the gold exchange standard that the reserve should be held in gold or would you say that the gold exchange standard is established if the reserves were held in exchanges which are at any time convertible into gold?—There would not be any difference between the two, but the difficulty is that in times of stress it is very difficult to convert the currency of any other country into gold. In the case just after the war, when these reserve council bills were being drawn, our gold standard reserve was invested in sterling, and so it could not be easily converted into sterling without very heavy losses. Then I have got another objection about the investment of that reserve. I do not know whether this will come in this connection. If that reserve is invested in that country then really one of the important objects of the exchange standard is lost. The object is that when there is this adverse balance of trade then the reverse councils should be drawn from here and these reverse council bills when they are produced there will bring out some of the currency which was locked up before into the circulation. That will affect the prices in England which will correct ultimately the exchanges; but just at present, when there is any sale of council bills, that money is not really locked up, so that the English money is not reduced; it is immediately invested and comes into the market, and that way the object is lost. It is lost wholly in the case of India, because there is no exchange reserve at all; it depends upon the total reserve of the Government of India.

1944. Let us suppose that the exchange reserve of India in Great Britain were invested in short term bank bills. If the reserve is employed then to that extent the credit structure in Great Britain is reduced, is it not?—Exactly.

1945. And, therefore, constitutes a contraction of the currency in Great Britain?—If it becomes effective I have no objection to investing in short term bills.

1946. You would have no objection provided you can be sure of being able to convert the proceeds of those bills into gold or any other gold exchange standard balance?—Exactly so.

1947. Do you really think that the transactions of this country can have any very material influence on the cross rate between sterling and dollars? Have you looked into the magnitude of the trade between Great Britain and the United States, that is to say, the magnitude of the exchange transcations passing daily between the two countries?—Probably not to the extent that India would desire to have, but certainly to some extent there will be this effect

1948. If you held, as you have suggested, your exchange reserve in United States dollars, and if trade were to flow as it has been flowing in the past to or via Great Britain, would you not in each case, when a settlement has to be made, have to convert your dollars back into sterling, and by that process settle your balance of payments?—That is what we had to do, but if we could draw bills directly upon America, then would not that affect the rate of exchange between England and America? That would create a greater supply of bills in England or America.

1949. You imagine, therefore, that you would keep your reserve balances in the United States, and sell the bills which you have drawn on the United States for sterling in order to be able to settle your sterling requirements?—Exactly.

1950. Just one other point. You suggested that it was merely because the Indian currency was hitched to sterling that the major part of India's trade went to Great Britain?—No, I do not suggest that. I said this was also one of the causes—trade with sterling—using countries has developed because the rate of exchange is fixed in sterling, but I consider this to be not a very important cause of the special distribution of our foreign trade.

1951. Are you aware that Great Britain up to the outbreak of war has done and it has since the end of the war regained practically the whole of its acceptance business and that to this day a very large proportion of international trade is settled through sterling. China, the Argentine, Brazil, in

fact a great part of the overseas trade of the world is being settled via sterling in spite of the fact that sterling had not reached the gold point?—That is because the most important trade of these countries is with Europe. If that were not so then America would have permanently taken away the position of London.

1952. But she has not, in spite of the fact that sterling had departed from the gold standard?—That is because the main market is Europe and not America, and in Europe English currency is the best currency.

1953. Do you not in these circumstances think that there must be somo advantage in settlements over London through sterling?—The settlements will be over London, but then the bills will be drawn in terms of gold. I don't understand how there will be any difference in the trade. Because bills will be drawn in terms of sterling when sterling comes to gold, and when sterling is not gold then they will be drawn in terms of gold. When this sterling fluctuates, then will it not be advantageous for trade to have gold rather than this currency the value of which is uncertain.

1954. (*Mr. Preston.*) Mr. Basu, I would like to ask you just a few questions in connection with the system of the gold standard reserve which was in force up to 1914. And in the asking of these questions I may just re-cover a little of the ground or a few of the answers you have given to our Chairman, but my object in doing so is simply to take our system in so far as I possibly can and to arrive this morning at what you would admit was a concrete statement of that system up to 1914. In Section II (6) of your evidence you say:—"Therefore my conclusion is that the gold exchange standard should be retained for India because it is the cheapest and the most effective currency, and therefore especially suitable for poor countries." Then again in sub-paragraph 5 of Section IV (2) you say:—"The gold exchange standard worked admirably well in India till 1914 as if the standard were of gold, but at a considerably less cost to the country." Now, our gold standard system up to that period might have been held to consist of our paper currency system and our gold standard reserve. Council bills I leave out entirely because, when all is said and done, that is more in the way of ways and means—would you accept that?—Yes.

1955. Then beginning with our paper currency system and taking the figures at the conclusion of balances in 1914, the gross circulation was 60 crores. The covering of that circulation in gold was in India 9·31, out of India 7·65, so that the total gold was 16·96. In silver in India we had a total of 29·87, and in other British securities in India there were 10 crores and in England 4, so that outside securities our metallic backing consisted of nearly 17 crores in gold and 29 in silver. And the policy then was with regard to our gold holdings in the paper currency reserve that the Government would give rupees, as you have stated, for any gold tendered, but they would not accept the obligation of letting out gold for rupees in the country. But, on the other hand, in the event of failure of the monsoon, they would let out the gold for export purposes only. Will you accept that?—Yes, that is so.

1956. In 1908 owing to pressure which had been brought upon Government, they departed from the rule, and they allowed quite a considerable amount of their gold to be given out in the country for rupees, not for export, they did not say: we insist upon export?—I should think it was not gold which was given out in the country, but at that time about a million and a half of the gold reserve was allowed to be diverted for railway materials.

1957. I will come to that afterwards. I am only talking now of the paper currency reserve. Let me put it this way. In 1908 a certain amount of gold was allowed to go out for internal purposes, and that all vanished. You don't remember that? At the time of the American crisis.—That was in 1907.

1958. Well call it 1907-09. Then with regard to our gold standard reserve, which now amounts to about 40 million sterling, the object of that reserve has always been, in so far as my memory goes—and I want to know whether you substantiate that in exactly the same way—how that reserve was a special reserve for a special purpose, namely, the maintenance of the exchange standard.

1959. (*Chairman.*) I want to open up that particular topic with the general question as regards the use of reserves. I think it might perhaps introduce a certain confusion into the examination if we take that now.

1960. (*Mr. Preston.*) Yes, we will omit that, and just speak on the paper currency. All I would say, Dr. Basu, would be this, that taking the system such as you understand it, the gold exchange standard which has served India so well in the past is clearly the best suited to India's needs at this stage of her development, provided that the managament of the currency is in the hands of skilled people, and that it is definitely settled by statute. Would you accept that as being exactly what you substantiate here as being the system best suited to India's needs?—Yes.

1961. (*Professor Coyajee.*) Dr. Basu, how far did the system prevailing in India before 1914 either differ from or approximate to the ideal gold exchange standard?—The most important point of difference is that there is no exchange reserve specially meant for that purpose in India, so that when the council bills are sold, and when they are presented here in India, the Government lets out money, and when gold is presented Government lets out rupees also. But when reverse council bills are sold in India the money should be locked up because the object of such sale is to reduce the currency because otherwise it wouldn't act as a corrective to the exchange. But when that is not done, then it ordinarily would not contract the amount of circulation in India, and that is the main object for which these reverse council bills are drawn.

1962. (*Professor Coyajee.*) In answer to the Chair you emphasised the necessity of keeping the reserves separate, because these reserves have separate objects and functions.

1963. (*Chairman.*) That is a question which I wanted to raise and develop later.

1964. (*Professor Coyajee.*) There is a quotation from Professor Kemmerer as regards the defects of the gold currency system of India before the war which I would submit to you and ask your view on.

1965. (*Chairman.*) I am afraid it will take the discussion just a wee bit away from the immediate issue.

1966. (*Professor Coyajee.*) I would submit that I may put this question—it must come in somewhere as a whole. The Professor says:—"The Indian system as it has so far developed, with its confusion of fiscal and monetary objects in the sale of exchange, with its mixing up of the functions of the gold standard reserve and the paper currency reserve and its excessively large investments of reserve funds in interest-bearing securities under the pressure of fiscal needs is thus far removed from the pure gold exchange standard." Would you at all agree with this criticism?—That is also the position I have developed here.

1967. Then two accusations have been brought forward against the old currency system of India as it prevailed before 1914. In the first place, it has been accused of causing a redundancy of currency and a rise of prices. What is your view as regards these?—That used to be the accusation of the late Mr. Gokhale also. It is extremely difficult to find out exactly to what extent the rise in prices is due to the inflation of currency, but as there is no free coinage in the country, certainly there cannot be any reduction of the currency by melting and I should therefore guess that there should be some redundancy of currency. But I cannot be positive about that point.

1968. (*Chairman*.) I am not quite sure that I follow your last answer. Is it to the effect that currency is not melted down in modern times?—It cannot be in India because the rupee is a token coin. Probably it was melted a little during the years 1919 and 1920 when the rate of exchange was not sufficiently high to cover the metallic value of the rupee.

1969. (*Sir Purshotamdas Thakurdas*.) I understand you to say, Dr. Basu, in reply to the Chairman, that unless international arrangements were made by the important countries to keep their gold reserves in various important centres, your scheme was not capable of being worked up to a great extent?—The ideal that I have put forward is not capable.

1970. Would you then suggest it for India, until the various important countries in the world follow a scheme of keeping gold reserves in important centres?—Not exactly that. My idea is that it will facilitate the introduction of a gold exchange standard in all countries if this reserve were guaranted by international agreements, but then if only one country wants to have it, it can have it without any international guarantee, and it can decide where it can safely keep its reserve.

1971. Provided then, you say, in the case of India, an arrangement can be made in America, or England?—In England arrangements have been made.

1972. Did you indicate that it is necessary in present circumstances to have an arrangement also made in America?—So long as sterling remains depreciated. So long as sterling did not approach the dollar, it would be some help to have gold in America as we had in 1918 or some other years when we had some bills drawn by the Secretary of State upon America.

1973. Would you not say that sterling has approached the dollar now?—It has.

1974. So that under the present circumstances, with the position that sterling occupies, would you think it necessary for India to have credits in New York?—In times of crisis, future crisis, that may be necessary, but in normal times I suppose it is not necessary to draw any bills on America, but that may be necessary whenever sterling is divorced from gold.

1975. You would, therefore, if you are devising a system of currency for India now or within the next six months, consider it necessary to have credits in New York to guard against any crisis?—No, if it is not meant to be permanent.

1976. If a scheme was devised for five or ten years, would you do it?—It is very difficult to foresee.

1977. But you are suggesting this, and I think I may simply ask for your assistance: supposing you were offered a hand in devising a scheme, would you consider it necessary to have credits in New York?—I think that we can re-establish our gold exchange standard on a firm footing by having a gold reserve even in England.

1978. And not in any other country?—We should remember in this connection that this ideal is contemplated with reference to the people mentioned, that is we should be dealing with all the countries accepting the gold exchange standard and not merely India. If you have it for India only, and as India does most of her trade with England, it may suitably for the present have a gold standard in England.

1979. Seeing that it may not be possible to get all the countries to fall into line, would you insist on having an arrangement with New York if you are devising a scheme for India at present?—Unless I am quite sure that the reserve in New York runs no risk. If I was sure that the reserve in New York will run no risk, then I would have a portion of the reserve even there.

1980. (*Chairman*.) What sort of risk have you in mind?—For example, I may mention as an illustration the seizure of the Afghan treasures in Italy.

1981. (*Sir Purshotamdas Thakurdas*.) Bearing all these things in mind, would you, if you had a hand in devising a scheme for India and knowing the conditions of India and various other circumstances such as the one that you mentioned last, think it necessary or imperative to have facilities in New York of the nature that you indicate?—It is very difficult to gauge the political situation, and the matter is wholly dependent upon the political situation in the world, of which I must confess I am very ignorant.

1982. (*Chairman*.) I rather gather the effect of Dr. Basu's answer would be that if you, Sir Purshotamdas, were devising a scheme as a financial expert, he would also wish to take advice from political experts as to what risks were involved.

1983. (*Sir Purshotamdas Thakurdas*.) I fully understand that Dr. Basu may be unable to take cognizance of political aspects. Overlooking the political part and purely as a financial adviser and expert, what would Dr. Basu advise?—I would like to keep the gold standard dispersed in several countries with which we have got important trade transactions; but if that were not possible I would be content to keep it in the country bills upon which can be sold more or less freely all over the world.

1984. You would construe then that to be a main defect in the scheme if any such arrangement was recommended or observed by the Government of India?—I do not call that a vital element of the gold exchange standard.

1985. Regarding the gold exchange standard, I thought you said in reply to Mr. Preston that it would have been best if the management of the gold exchange standard was in the hands of—as I understood the words—capable men. Was it in capable hands till now or till 1918-19, or not?—The point is to what extent the capable hands are guided and restricted by statute. The law in this connection is I think a good deal defective. First of all the Government of India is not compelled to give gold in exchange for rupees although it is a vital element of maintaining the standard; you cannot maintain the exchange standard unless the Government is willing in all circumstances when the rupee tends to fall below the fixed rate to give an unlimited quantity of Reserve Council Bills—and Government had been doing this till the crisis of 1920.

1986. So that would you say that that was properly carried out?—It is very hard to pass a judgment.

1987. I may only ask you whether the history of this policy till 1918-19 would call for any criticism from you?—When I said that we should provide that it should be in capable hands, I was contemplating the other part of the question, *viz.*, the system and the reserves. Well I would say that the system was substantially a right one and I would keep the system, with the modifications which I have suggested, especially about the reserves.

1988. (*Mr. Preston*.) Mr. Chairman, arising out of the last question, may I in order to remove any doubts as to what the final finding was say, 'provided that the management of the currency is in future in skilled hands,' so that there will be no question of casting any reflection on what happened in the past.

1989. (*Chairman*.) We will make that alteration in the question. I felt no doubt in my own mind that the point of the question Dr. Basu was asked was whether he thought that such matters as those connected with exchange and currency were better in the hands of skilled bankers than in the hands of Government officials. There was no question as to the personal capacities of the persons concerned. You have laid considerable emphasis, both in your memorandum and in your replies to-day, upon the maintenance of a rigid separation between the currency reserve and the exchange standard reserve. Will you tell us why you lay so much emphasis upon this point? I do not find the matter developed very fully in your memorandum?—When there is any rise in exchange or there is an excess of exports over imports, naturally the corrective would be under the gold standard system in such cases the importation of gold; that is, the currency of the country where there has been a

large amount of export will be reduced and thereby the prices will fall there and that currency will come through to India and swell the currency and increase the prices here, so that exports will diminish and imports will be encouraged. This is the natural corrective when there is a free inflow and outflow of gold. This operates under the Indian system also when Council Bills are drawn by the Secretary of State, but when the Council Bills are drawn in England, then the English currency is contracted. I assume that that money is not given out; that money ought to be contracted and thereby there will be a reduction in the currency of England, whereas these Council Bills, being presented in India, would release rupees from the Government treasury, thereby increasing the currency here in India, which will raise the prices. This rise in prices here and fall in prices in England will bring about a corrective when there is an excess of exports over imports. At present against Council Bills currency is given out in India but when reverse Council Bills are drawn, the money ought to be locked up and thereby the currency ought to be contracted, but that is not actually done, that is, being mixed up with the currency reserve, it may come out into the circulation. The omphasis that I give on this rigid separation is for this purpose, namely, that when it is necessary to reduce the currency of the country, then this currency should be reduced by the sale of Reserve Council Bills, and this money should be locked up till Council Bills are drawn by the Secretary of State.

1990. Let me take your answer in one or two steps. Under the old conditions the exchange reserve was separated and yet there was no provision for automatic contraction. Is it not, therefore, a natural and inevitable condition of a separate reserve that it should provide for automatic contraction. It requires some further provision, does it not?—The automatic contraction means that the currency should never be let out unless there is any need for exchange purposes. By this rigid separation of the exchange reserve here or outside India we can bring it for the purpose of internal trade almost to the same level as the gold standard.

1991. By a rigid separation are you intending some other condition as regards the exchange reserve than that which prevailed before the war, or are you referring to the degree of separation which then existed?—Before the war there was no exchange reserve as such. The exchange bills were met out of the general balances of the Government and whenever the general balances required the money was given out again.

1992. You do not look upon the so-called gold standard reserve as an exchange reserve?—On the other side probably we have got some separate exchange reserve although its separation is not rigid; because that money is invested there but really there is no contraction; but on this side in India there has not been any reserve so far.

1993. So that, by the gold reserve to which you are referring as that which must be kept rigidly separate, you have in mind a reserve of actual gold metal in India?—Yes. It need not be actual gold; it may be convertible into rupees—some rupees which can at any time swell currency and reduce currency and that will make gold exchange standard automatic. My contention is that although it is Government managed, if it is properly managed it can be as automatic as in a gold standard country.

1994. How would you provide that the use of such a gold reserve held in India would effect an automatic contraction when gold is sold or exported?—Only gold bills will be sold—that is, reserve council bills will be sold.

1995. You think it is possible to effect a complete separation between the functions of an exchange reserve and a paper currency reserve?—That is my idea, that it should be absolutely separate, except that you can exchange gold for coin between the two reserves; but the reserves as such should be distinct.

1996. Would you agree that it is possible to devise a scheme by which the two reserves may be combined and yet provide for those automatic features in the working of the system to which you have referred as essential?—I do not know; but if the object can be obtained by having one reserve, I have no objection. My idea is to make it automatic. If that can be attained by any other way, I should have no objection. But this is the means which has occurred to me as the only sufficient means for that purpose.

1997. To be quite clear, if it were possible to devise some system for the combination of reserves which would work automatically as regards the contraction and expansion of the currency your objection to separate reserves would then have gone?—Yes—that is, contraction and expansion of currency with reference to the external trade.

1998. What are your views in regard to the transfer of the administration of the note issue and exchange operations to the Imperial Bank of India?—That is its proper place. In fact this is a banking function; but for a long time the Government of India has been doing a lot of banking functions and it seems that in recent years it has gradually divested itself of some of the banking functions. You mean just as it is done in England through the Bank of England?

1999. Yes, with whatever necessary adaptations were required to suit Indian conditions?—Yes, with adaptations to suit Indian conditions.

2000. You would prefer that the management and control of the note issue should be in the hands of the Imperial Bank, and I understand that you base that preference upon having matters which are apparently typical banking matters in the hands of experienced bankers?—Yes.

2001. Are there any other reasons prominent in your mind for the transfer?—That is a question which deals mostly with the administration of the system about which I do not think I can offer much useful opinion.

2002. Assuming the transfer, under those conditions, whether the reserves are separate or not, you contemplate both reserves, as I understand it, being under the control of the Imperial Bank?—Yes, under the control of the Imperial Bank.

2003. Have you been able to form any views as to the magnitude of the reserve which it is desirable to hold under these conditions?—That of course will vary from time to time. But it will be mainly dependent upon the foreign trade of India and from our recent experience it seems that £40 million is not a very big reserve. And in India the amount of the reserve is not very material also; because the Government of India's resources are here at any time for replenishment. The difficulty is in the case of an adverse exchange.

2004. You refer to the foreign trade of India. I imagine in estimating the total reserves which it is necessary to hold one must look, in the first place, must one not, to the possible contractibility of the currency of the country for the purpose of conversion into foreign currencies for the payment of exchange payments?—I could not follow you.

2005. For the sake of simplicity, let us consider that you combine the reserves under the control of the Imperial Bank of India. How would you set to work to estimate what the magnitude of the reserves should be which you would keep in that combined reserve, both for the purpose of securing the internal convertibility of the note issue and for the purpose of securing the exchange value of the Indian currency?—For the exchange reserves, I suppose the main point to be considered will be the fluctuation in the foreign trade, i.e., to what extent it will go up and to what extent it will fall rather than the magnitude of the foreign trade. For internal purposes I do not suppose I can say very much except that the system worked so far seems to be quite a good one. It may be that the cash reserve is a little bit too high;

but probably for a country like India where the rural population, particularly in Northern India, want cash only and nothing but cash, probably it is better to have a sufficiently high reserve for that purpose.

2006. Passing to another aspect of the gold exchange standard, have you any view as to whether it would be desirable or not to have gold in circulation as an auxiliary feature of that standard?—In India?

2007. In India?—I would be very much against that.

2008. What are your grounds for being averse to that?—The main ground is that it will mean a greater national wealth being kept for circulating medium while it can be easily done with the help of notes and token coins.

2009. Would you go so far as to demonetise the sovereign in India?—I do not think it had much circulation and if it is demonetised not much harm would be done.

2010. If it has not had much circulation you look upon that as not of great practical importance?—No. The sovereign was made legal tender so long as our standard was a gold standard but now that it had become gold exchange standard, I do not think there is much significance in having the sovereign as a legal tender.

2011. One of the main problems during the war arose out of the rise in the price of silver and I want to refer to that subject next. In similar circumstances, as I understand from your memorandum, you would either let the rate of exchange go up or you would reduce the silver content of the rupee?—You will have to do so.

2012. Either the rate of exchange will have to be raised or the silver content of the rupee will have to be reduced. What about the latter measure? Is that a practicable measure in India—to debase the rupee?—I do not think it will be even a safe measure. The rupee has got a certain amount of sanctity about it from a very long time and it is used not merely as a currency but even in villages its weight and fineness are utilised for other purposes. For example, the goldsmith's measure is this rupee and there are various other functions in rural India which the rupee performs and so long as a token coin or any currency is dependent upon the faith of the people, you must take into account the sentiment of the people and I am sure there will be a good deal of suspicion if the rupee is debased.

2013. So that, contemplating the possibility of a rise in the value of the silver content of the rupee above its token value, you consider that you would be driven to the former alternative, that is a rise in exchange?—That is what India did in 1893; that is what India did again from 1917 to 1920.

2014. That, no doubt, would be the lesser of the two evils?—Yes; and as this change is practically due to the influence of foreign exchange, I should think that the change should come first upon the foreign rate rather than internal currency; because internal currency has little to do with these fluctuations. Moreover the people who would be affected by the rate of exchange are more educated and are those who could understand the reason for exchange fluctuations better than those who use the rupee. So both from the point of view of reason and from the point of view of sentiment, I would deprecate any change in the metallic content of the rupee.

2015. Have you given any thought to the subject of the price of silver and what may be reasonably foreseen as the future price of silver?—I do not think I can say anything about that.

2016. It is rather a highly specialised matter?—Yes.

2017. Now as regards the actual rate of exchange which might be selected, in your view (it is the outstanding opinion expressed in your memorandum, I think), there still exist such disturbing factors as to make it premature to fix the actual rate of exchange at the present time?—Yes.

2018. You deal with this in particular in Section IV (3) of your memorandum. I understand that you would wait until greater stability had been attained in some of the European currency systems. Perhaps you would indicate in a little more detail to the Commission what are some of the more doubtful factors in the situation, the solution of which in the future would justify at that time an attempt to stabilise the rupee?—The most important factor is that there is not that trade recovery which is bound to come, and with the trade recovery whether these countries will be able with their slender resources to maintain the rate of exchange which they have fixed now is to be considered.

2019. Supposing it were decided to stabilise at a rate X, what difficulties do you foresee in maintaining that rate supposing there to be a trade recovery? In the first place, are you contemplating a boom or a slow, gradual improvement in the world's trade?—It must be slow and gradual.

2020. What would the difficulties be in maintaining any given rate X supposing there were to be a slow, gradual improvement of the world's trade and increased production?—If there were uniform improvement both in the imports and exports of these countries then probably it will not be so difficult for them to maintain the rate they have fixed now, but the difficulty is that trade recovery is not likely to be uniform in that way, and if it is not uniform then there is bound to be fluctuations and there may be very violent fluctuations, and whenever there is a chance of such fluctuations the rate for the time being must break down.

2021. Is there anything in the present economic situation of the civilised world to lead you to think that the circumstances of trade improvement are likely to show more extreme fluctuations from country to country than they do under normal conditions?—The very fact that the trade and production of these countries have broken down and that they are trying to develop them shows that there is likely to be more violent fluctuations than in normal times. Some trades may have developed but other trades may not be allowed to be developed. An important factor also as I mention here is the economic provisions of the Peace Treaty which are, I think, directly hindering the economic recovery of the world.

2022. (*Sir Maneckji Dadabhoy.*) What was your last sentence?—That the economic provisions of the Peace Treaty have directly hindered the economic recovery of the countries concerned. For instance according to the Treaty Germany is to pay an indefinite amount of indemnity to other countries. But there are only three ways of making these payments—either by giving the gold which Germany has not got or by having a loan temporarily which America has refused because of the attitude of the other Allies, or by the export of German products, but German products are shut out in all these countries. In fact Germany, even if she wants to make payment to England and France, will have to demolish the industries of these countries. So on the one hand you want indemnity and on the other hand you shut out all the means of making that payment.

2023. (*Chairman.*) What we have to consider, is it not, is whether there is any conspicuous change in the economic conditions of Europe which is foreseeable. As regards what you said about reparations, may it not be considered the case that the introduction of the Dawes Scheme has produced a stable condition as regards that factor in the situation?—For the time being it has, but so long as the total amount of the reparations is not fixed I do not think we can foresee anything about the fluctuations in German trade.

2024. In the second place, might it not be said that, as regards this situation, the resettlement on a more friendly basis of political affairs at Locarno has stabilised the situation?—It may have to some extent. Whatever will stabilise the European political situation will, I am sure, affect the present question also.

2025. Can you point to a period in the future at which you would think it safe to try and fix the rate of stabilisation for the rupee? Can you define when that time would have come?—I will say the time is coming when the production in these countries has recovered to their, not exactly pre-war level but something like pre-war level; when the system of production in these countries has recovered to almost their pre-war level, I will say that at that time it is likely that the set-back during the war has been recovered and therefore for that reason there is not likely to be any very violent change.

2026. You tell me that there is no disturbance of the sort to be feared if the improvement is uniform?—If the exports and imports of a country go on increasing at a uniform rate then there is likely to be less fluctuation.

2027. What is disturbing is that the improvement is not uniform but here faster and there slower?—Exactly; and that will bring about violent fluctuations in the exchange rate.

2028. I do not think you have told me yet, have you, why you suppose that it is likely to be here faster and there slower in the foreseeable future?—That is because in some cases the productive machinery, that is, the system through which production was being carried out before the war, has been completely destroyed; in other cases, it has been transferred to wrong hands; and in others again it may be partially in its original state and requires revival only; so that wherever the materials for revival are good they are likely to be developed as soon as the country can export.

2029. Supposing that your view be accepted, that the time has not yet come to stabilise, would you say that it is nevertheless necessary, as a practical measure, to recognise some temporary middle rate as the rate which it is best to maintain?—Yes, probably it would be profitable to have that; but I would ask two things to be taken into consideration—first, that a rate should be fixed which the Government will be certainly able to maintain. They should not fix a rate as they did in 1920 which they could not maintain even for a few months and which brought about such grave loss. And secondly, it should be declared that it is a temporary rate, and whenever we have a temporary rate there is that upsetting effect upon the trade and production of the country. As I pointed out at the beginning of my memorandum, these effects will operate whenever the rate is changed. So if the rate is changed temporarily and permanently hereafter and there is any difference between the two rates, it will naturally have an upsetting effect on the trade and production of the country.

2030. Does it make a tremendous lot of difference, if you are working to a rate, whether you call it a temporary rate or a permanent rate?—Yes, because if it is a temporary rate you will have to change it again. If it is a temporary rate, then for one or two years the rate may continue and at that rate the trade and production of the country will settle down to a certain level. If later the rate is changed and Government maintains a different rate, then the trade and production of the country will be deliberately upset. I do not say it will be bad but there is that upsetting effect upon the trade and production of the country.

2031. If you had a temporary rate you would not change it, would you, unless you had to, and similarly if you had a permanent rate you would not change it unless you had to. Is there any real difference in the practical working of the two?—The real difference is that the temporary rate also will be maintained by the sale of council bills and reverse council bills. That is, the assets of India for maintaining the exchange rate will be utilised for this purpose; and it may bring about a loss as it did in 1920; so I would not like to use the present gold standard reserve for maintaining a temporary rate. If no rate is fixed then the Government is not bound to maintain it; but if it is fixed, even if it is temporary, Government must maintain that.

2032. Admitting that one must have some rate to work to, pending a final stabilisation, which rate would you refer?—If any rate is to be taken at all, and I must qualify myself by saying that I do not advocate any rate myself, I would take the mean rate prevailing in the market. I suppose during the last six months or so or about a year you can say that there is a mean rate which can be found somewhere between 1s. 5d. and 1s. 6d. I mean the rate prevailing during the last six months or a year. Say if you take one year's mean rate then that is likely to be a real rate rather than if you take any other artificial rate.

2033. You take last year's mean rate, and then you make use of your exchange standard machinery to maintain that rate only announcing that it is a temporary rate and not a permanent rate?—Yes. If it is at all necessary to have a temporary rate then I would try to find out the rate prevailing over the last year or so. But personally I would not have a temporary rate adopted by Government.

2034. How would you use the machinery of the exchange standard system? Would you not use it at all?—Not use it at all, as it has been used, except for purposes of the expenditure of Government.

2035. (*Chairman.*) I have only two minor questions on points of detail to ask you in conclusion. Perhaps it would be convenient if we took any supplementary questions now.

2036. (*Sir Maneckji Dadabhoy.*) You say that you do not recommend stabilisation till actually trade recovery takes place?—Till we are sure of a rate which is likely to be permanent.

2037. Now do you expect that when the trade recovery comes that recovery is going to be permanent in all countries or probably temporary and limited to certain countries only?—There will be difference in the development but on the whole the economic condition of one country is linked with the economic condition of other countries specially in the case of European countries where the external trade is so big as compared with the internal trade. But even if that is not so, even then I do not think it will be very difficult to fix a more or less permanent rate when many of the countries have returned to their normal condition. There will be difference in the development; but on the whole I suppose the economic condition of one country is more or less linked with the economic condition of other countries. That applies especially to the countries of Europe where external trade is so big, as compared with internal trade; but even if that is not so, I don't think it will be very difficult to fix a more or less permanent rate when many of the countries have returned to their normal conditions. If many of the important countries returned to their normal economic condition then I think it would be easier for us to find out the rate of exchange which we can maintain permanently even if all countries do not recover simultaneously.

2038. Which would you prefer of the two alternatives, to fix a temporary rate or not to fix at all and allow matters to drift?—Not to fix at all for the time being.

2039. (*Chairman.*) That is what Dr. Basu said. He said he was not in favour of fixing a temporary rate.

2040. (*Sir Maneckji Dadabhoy.*) Speaking about this temporary middle rate you said you were not in favour of it but if it was absolutely necessary you would take the mean of the six or twelve months previous?—So far as possible the rate which is current in the market.

2041. Would you in fixing this temporary rate do it for a limited period or generally till trade recovery comes in, say for four or five years?—I suppose it would be best to leave it as it was till it is unfixed again by the permanent rate. I would like to have the same temporary rate till you arrive at a permanent rate.

2042. You don't think that the temporary rate is open to the same disturbing causes as you have in fixing a permanent rate?—The temporary rate as it is prevailing now?

2043. Yes?—It is very hard to judge that but there will certainly not be much loss, if no rate is fixed, from the Exchange Reserve Fund. Our Reserve will have to be utilised for the temporary rate.

2044. Do you expect a speedy recovery in the rate of European currencies?—Not at all.

2045. Would not some good be done then by this temporary settlement of the rate?—I don't know; that will depend upon whether this temporary rate will remain more or less the market rate in the future.

2046. That is very problematical?—Very problematical. My point is that we cannot forsee.

2047. (*Mr. Preston.*) Dr. Basu, with reference to my former questions I would just like for the purpose of emphasising what actually took place in 1908 in connection with the paper currency reserve during the crisis of 1907-08 when £4,179,000 in gold was withdrawn by the public from the paper currency reserve, only £250,000 was exported on private account. That was the first time our system broke down and really the breakdown was due, was it not, to mis-application of the system rather than the fault of the system itself?—Yes.

2048. So if that £4,000,000 gold had been refused to tenders of notes or rupees, whereby that gold was allowed to go into internal circulation or hoards, and the old ruling had been upheld whereby that £4,000,000 ought to have been exported, the equivalent of that £4,000,000 either in notes which would come in and be cancelled or in rupees which would have been withdrawn from circulation would have provided an automatic contraction which would have almost saved the then situation?—Yes.

2049. Then later on that same year, when the adverse tide could not be stopped Government again began to operate on the gold standard reserve and Council Bills were drawn on the gold standard reserve in London to the extent of about £8,000,000 sterling. Here again the equivalent of the £8,000,000 sterling in actual rupees was held in the land of India as the Indian portion of the gold standard reserve and produced a contraction of the Currency, so that, that agrees, does it not, with your idea of what the actual automatic working of the gold standard system should be?—Yes, that is so.

2050. And to do this in the event of adverse exchange and the necessity for drawing bills from this end on the gold standard reserve the equivalent amount of Currency on this side either in notes which will come in to be cancelled or in actual rupees, must be held on this side as an equivalent of the gold which goes out in the other?—Yes.

2051. Thus producing the contraction necessary to restore our exchange balance?—Yes. But, may I point out that the Government did this in 1908 under great pressure? The Government did not follow this policy in normal years. I want to make this policy a normal feature in the machinery.

2052. That is the method whereby in your opinion a gold exchange standard should be administered?—Yes. And this four million pounds should not have been given away in gold in India, but I would give it only in the form of gold bills.

2053. Or gold for shipment?—Yes.

2054. (*Sir Alexander Murray.*) You replied to the Chairman just now suggesting that it was not desirable to fix a rate in the meantime. If that is so, how can you deal with the upper and lower gold points as regards remittances at the present moment. There could be nothing automatic in exchange?—No.

2055. (*Chairman.*) Dr. Basu's final reply to me was that he would make no use of the apparatus of the gold exchange standard.

2056. (*Sir Alexander Murray.*) Assuming you would make no use of the apparatus would exchange stay in the vicinity of the present rate?—You cannot say. It is because of that, that I would not utilise the gold standard reserve for such uncertain purposes.

2057. You would be prepared to let exchange run wild at the present moment and if it went up to 1s. 7d. or 1s. 8d. or 1s. 9d. you would not take any action?—No. Unless there are more definite data I would not use the gold standard reserve for fixing any rate or keeping up any rate even if exchange went up to 1s. 7d. or 1s. 8d.

2058. Irrespective of the effect it would have on prices in India, you would allow exchange to run wild as you said and would not intervene?—I think the evils of the system would be greater than the advantages. I recognise all the evils which you point out but I see that the disadvantage of using our gold standard reserve is too much with an uncertain rate which is not likely to be permanent and which as far as I can forsee cannot be ascertained The evils of this will be greater.

2059. (*Chairman.*) What would the evils be?—One evil would be that our gold standard reserve will be used up and then there will be another heavy breakdown just as we had in 1920-21. In 1920-21 the speculators won and speculation was so strengthened simply because people knew definitely that the Government could not maintain the rate and as soon as the rate fell below that amount they could bring back that money and make a profit. Sometimes the profit was three or four times the amount they invested.

2060. The evils experienced in connection with the breakdown of the 2s. rate?—Yes. I would say that the machinery should be utilised only when the price of silver rises again and approaches 43 pence or goes beyond that, in which case, in any case, we shall have to draw Reverse Councils if we want to maintain our rupee circulation. So, in order to preserve the rupee coin we shall have to draw Bills whenever the rate goes beyond 43 pence per ounce. But except in those circumstances I don't think we should utilise our machinery just for the present to fix a rate. (*Sir Reginald Mant.*—I do not quite catch what you say.)

(*Chairman.*) The general effect of Dr. Basu's answer was that you could only use the machinery of the Exchange Standard method in order to deal with the situation when the price of silver was rising so high as to imperil the rupee.

2061. (*Sir Reginald Mant.*) I understand that during the period for which the rate is not fixed you would not employ the machinery for contracting or expanding the currency?—Not for that purpose. It will take its automatic course through bullion. I would leave it to bullion to do that work.

2062. But supposing there is a sharp rise in exchange which indicates possibly a necessity for expansion of the currency, where would the bullion come from to bring that about?—A sharp rise in the rate of exchange can be only as a result of excess of export over import and this would bring gold into the country.

2063. But how will that gold become current? How would it be added to the currency?—It would not be actual currency; it would be taken to the Government for exchange into rupees or the gold may be the basis for credit in the banks. It is not absolutely rigid. If the Government does not interfere in the matter of exchange, expansion or contraction does not cease altogether.

2064. Do you mean that the Government would have to buy the gold?—No. It will come on private account. For the present, until we come to a fixed rate, my idea is that the Government should not do anything to fix a rate.

2065. (*Chairman.*) I am afraid you are a little at cross purposes. Dr. Basu says that the gold should be imported on private account. What I think you are asking is whether gold should be bought on Government account.

2066. (*Sir Reginald Mant.*) I am trying to ascertain how that gold would serve to expand the currency if there is no means of turning it into currency?—It will be. The Government by law is bound to give

rupees in exchange for gold. Even if that is not so, the effect of expansion of the currency upon prices will be neutralised by making that gold a basis for the expansion of credit. Most of the gold which will be imported might be used as a basis for credit. Business men would not bring this gold in for their private use.

2067. First of all, you said that the gold would come to Government in exchange for currency. That could not take place until the exchange had risen to 2s. because Government is not bound to give more than Rs. 10 to the sovereign. So until the exchange rose to 2s. no currency can be obtained from Government in exchange for the gold, is not that so?—Yes.

2068. So, the gold imported will merely form the basis of credit expansion?—That is the only thing that it can do.

2069. Don't you anticipate that there would be serious stringency in the money market here if Government took no steps to expand currency when exchange was rising sharply?—Yes, Government is taking even now, I suppose, some steps specially in the busy season.

2070. Yes, take the present season. What would happen if Government did not purchase sterling?—Government did not do that in view of the foreign exchange but in view of the tightness of the money market. If there is tightness, Government will look into the internal prices, and will take whatever steps they are taking even now. That does not necessitate the fixation of a temporary rate just at present. Even without a rate the Government is doing this for internal currency and Government will be doing that also in connection with internal currency, not with foreign exchange as such.

2071. I do not quite follow you. You mean that Government should make additions to the currency when there is stringency in the money market?—Temporary provision will have to be made, as Government is even now making. For example those rupees which are issued against hundis, the notes which are issued against hundis in the last 4 or 5 years. In that way Government can expand currency whenever there is stringency in the money market but for that purpose the rate of foreign exchange need not be fixed.

2072. Government can expand currency by making loans to the Imperial Bank against hundis. Government has also in the past busy season made large purchases of sterling which have had an effect of expanding the currency and relieving monetary stringency. Do you propose that Government should continue that also?—That is one of the means of providing currency in the country. As such I would not object to Government doing that. My objection is not against the contraction and expansion of currency which Government may undertake for internal purposes. My objection is towards the using of the gold standard reserve now for any temporary rate, which it may fix at present.

2073. What principles would you lay down to guide the Government in making these additions to the currency if it had no reference to the prevailing rate of exchange?—I suppose the rate of money is the main guide.

2074. You would lay down no principles?—I do not think I can say much about this expansion of currency as a result of the internal tightness of the market. In fact the questionnaire which the Commission has issued I read only yesterday while travelling. Before that, that side of the question did not strike me at all.

2075. Would it not be very difficult for Government to regulate the business of expanding and contracting the currency if you had no index to work by in the shape of a rate of exchange?—I do not know what is the present index for that purpose. But certainly it is not the rate of exchange. It must be something else. It must be the condition of harvests and the likely demand on the important centres of money for withdrawal of money for villages or financing the transport of crops from the fields to the exporting centres or the distributing centres. There must be some such index by which Government is guided, but I do not think that it is the rate of exchange.

2076. Recently Government has purchased sterling freely at an upper limit of 18$\frac{3}{16}$d., which corresponds practically to the gold export point with exchange at 1s. 6d. That gives a clear indication, a clear test of the demand for currency with 1s. 6d. exchange. If you have no fixed exchange, what test would you substitute for it?—I do not think it is so much the rate of exchange which guided the Government in purchasing sterling; this was a convenient means of releasing money into the Indian market.

2077. What test would you give for the guidance of Government during this period in which you have had no fixed exchange?—The same guidance which the Government has received during the last five years.

2078. Can you say what that guidance was?—No. It was certainly not upon the rate of exchange. It must have been something else. I suppose the rate of money in the important centres is the main guide.

2079. For the last 5 years the problem has been mainly one of contraction, to withdraw the redundant currency which was issued a few years before. But now that that contraction has been effected the main problem is to meet the requirements of the country for expansion of currency. What I want to make clear, and I cannot understand it from your reply, is how Government should be guided in meeting those requirements if there is no standard of exchange?—If an exchange rate is fixed merely for such guidance, then I suppose that rate would have to be maintained also by drawing reverse councils and council bills and my main objection as against that is that there should not be any further working of the machinery till we get to a permanent rate.

2080. You mean that you would have no objection to fixing the upper limit of exchange, but you would object to Government trying to keep exchange up to that limit. You would have no objection to pegging the upper limit, but you would object to pegging the lower limit?—My objection is to pegging it at all just at present.

2081. (*Chairman.*) I do not think I understood Dr. Basu to mean that.

2082. (*Sir Reginald Mant.*) His main objection is, he said, to dissipating our gold reserves which would not apply to pegging the upper limit? I ask whether that objection does not apply only to pegging the lower limit?—Then also it means that council bills would have to be drawn whenever the rate tends to go up beyond that and it will be using the machinery for the other purpose drawing upon the Govt. of India.

2083. You would object to additions to the currency being made in that way?—Yes, although it is a very difficult question to settle how Government will decide to expand or contract the currency.

2084. You cannot give us any guidance?—I do not think I can give any guidance, but I think it will be very wrong for us if we really do anything with the exchange reserve at the present moment. That is what I feel and that is the reason why I object to the fixing of a temporary rate but this will certainly create some difficulty in this way. But Government besides the rate of exchange must have some other means of judging the condition of the money market in the country and I think Government ought to decide about the contraction or expansion of currency by those tests rather than by the rate of exchange for the present.

2085. (*Chairman.*) Even if imported gold on private account goes into the Government reserves or the Bank reserves to serve as a basis for credit, it has to be recognised as of some definite ratio to the rupee to serve as the basis for credit. You cannot say that there is gold there?—Yes it will have to be. That will be according to the market rate, the market price of gold.

2086. Which will shift from day to day?—Yes.

2087. That would be rather a difficult arrangement for the unfortunate banker, would it not?—It would not be for the banker to find that out it would be for the ordinary individual who has deposited it. That will be in terms of some definite gold amount. Even now when the value of gold changes from time to time, the banks have to have some gold and there must be some fluctuation in that.

2088. Under your proposal, the banker's cash reserve against his credit would be fluctuating in relation to the credit based upon it in accordance with the changes in the exchange market, in regard to which *ex hypothesi*, there is nothing to control?—Yes. It will really be selling that gold to the bank, or, if the bank does not want it, selling that gold to tho market and depositing the amount.

2089. (*Sir Purshotamdas Thakurdas.*) Between the period from now until the time when you think it would be correct to fix or stabilise exchange, who do you think should be in charge of the Government operations for getting money home for the home charges? Would you have the present system or would you suggest that the Imperial Bank should be asked to do that?—I should like to have all these operations done by the Imperial Bank simply becauso this is really banking work.

2090. Therefore your idea is until exchange is stabilised at some point by Government by statute, the Imperial Bank should be put in charge of the task of getting the money to England?—Yes.

2091. Which means a change from the existing system?—Yes.

2092. And you would not give them any basis on which to work or any points between which to work?—The same principle on which the Government has been working; they will simply take over the same machinery.

2093. What has been the Government machinery till now? The machinery for maintaining exchange. There is no upper point?—At the present time no rate is fixed by Government.

2094. Therefore they have the field open to themselves. They could have gone up to 1s. 8d. and 1s. 9d. or come down to 1s. 4d. if they liked?—Yes.

2095. You would hand over the whole of the machinery as it is to the Imperial Bank?—Yes; at present it is really the banks which determine the rate of exchange; Government has little to do with it.

2096. You think so?—Yes, just at present.

2097. If the Government did not purchase in the market as they did, do you think the bank would have any substantial hand in it?—Yes, but that is only to provide money for these same banks. These same banks have been crying for accommodation in India for the internal market and this is one of the means by which the Government have placed money in the hands of the people.

2098. Do you think the Finance Department is working hand in hand with the exchange banks?—I have no knowledge of that.

2099. If you think they are doing this to feed exchange banks what do you think is the reason for it?—If the Government has not been doing this for placing money in the Indian market, I do not see any reason why they bought this sterling because they have certainly fixed no rate.

2100. You are unable to understand the motive of Government in purchasing exchange?—Unless they want to place the money in the market.

2101. It would be to maintain exchange at this point?—They have not declared any rate.

2102. In the absence of any declaration, what is your inference?—My inference is that they want to ease the tight market in India.

2103. It has nothing to do with the exchange point?—That is what strikes me.

2104. Regarding the question of waiting to stabilise the exchange until there is trade recovery, do you not think that this very important point must have been taken into consideration by Great Britain when they brought the pound sterling to the gold point?—Let me make it a little more clear. The trado recovery you refer to is not trade recovery in the East or in India; it is mainly confined to central Europe.

2105. Don't you think England must have taken this into consideration before they came to the decision that they would come up to the gold point and keep there. Or do you suspect that they may have overlooked it?—No. They must have taken this into consideration.

2106. With the resources at the disposal of Great Britain don't you think that they will not allow their calculations to go wrong if they can possibly help it, and if so, is that not sufficient guidance for India at present?—I would like to know what the conclusion was to which Great Britain came in regard to the trade recovery.

2107. Well, let me give you what appears on the surface. In 1920 the Babington Smith Committee recommended two shillings. Great Britain did not then try to go to gold point?—Because it could not.

2108. It doesn't matter. The fact remains that it did not. I am mentioning a fact. But later on she did. The presumption to the ordinary man in the street is that there was something in 1920 which did not inspire confidence then on the part of Great Britain that things were in a fair way, which later on perhaps prevailed?—It may have been the recovery of trade and the recovery of England itself. So far as I can see it was in 1919 this trouble began. Before that policy the sterling rate was at 4 dollars and 76½ cents. In March, 1920, there was a very great divergence in the value of the dollar and after that continuously the Government of England has been trying to bring the sterling to gold parity.—From the end of 1921 or so. I think it is regularly coming to that. In 1920 it would have been impossible.

2109. The decision of the Government in England does not inspire confidence in you that it must have taken cognisance of all the world conditions?—I don't say it does not inspire confidence. But I would like to know the reasons on which they worked. Without knowing them I do not know exactly in what way they were influenced by these considerations.

2110. One more question, Dr. Basu. You realise that we have on the statute the two shillings ratio. You don't think it is a live danger to India to keep that ineffective ratio on the statute?—I have indicated already that it ought to go as soon as possible.

2111. But we are now thinking of the present or the immediate future. We are not thinking of the ultimate ideal when central Europe is all built up and everything is rosy and happy and we can say that the world has recovered. In the meantime, with this two-shilling ratio on the statute of India do you not think we are running a very serious risk?—I have no objection to its being abolished.

2112. Would you substitute nothing?—No.

2113. (*Chairman.*) That, of course, is the effect of what Dr. Basu has been advocating throughout, that there should be no official regulation at all.

2114. (*Sir Purshotamdas Thakurdas.*) Leave it absolutely to the commercial world to play with it—for 1s. 3d. or 2s. 2d., whichever they liked?—Ultimately it is left to the commercial world.

2115. And your motive for that is that the gold standard reserve must in the meantime not be touched. Whatever variations there may be, this gold standard reserve must be preserved for some future date when we may need it?—Yes.

2116. (*Sir Henry Strakosch.*) I should like to take Dr. Basu back to the question of reserves. You insist upon the necessity of having two reserves—one to stabilise the exchange and the other one as a currency reserve. Could you tell us whether you know of any system which rigidly separates the reserves in this fashion?

2117. (*Chairman.*) I think Dr. Basu said that, if a system could be devised for a combination of reserves which would secure at the same time the automatic contraction and expansion of the currency according

to the exchange position, then his objection to the combination of reserves would be removed. I do not know if that is of any value.

2118. (*Sir Henry Strakosch.*) I was trying to get to that point. Do you know of any such system?—No, because the gold exchange standard does not exist elsewhere.

2119. But the gold exchange standard was in operation in a good many countries before the war?—Not the gold exchange standard in its perfect form but only a breakdown from the gold exchange standard. Before the war some countries had the gold exchange standard—they were merely following the example of India. India also introduced it after a breakdown in 1899 and after the unfortunate experiment of 1900 Government tried to have the gold actually in circulation. Since then we can say that our standard has become a gold exchange standard. India did not adopt it deliberately but simply by accepting the breakdown in the prospective gold standard. And the other countries all got their system from India. So if you don't find that the system was worked out scientifically, that should not deter us in any way, because no country arrived at it in a scientific way. I would have it fixed by having this automatic factor introduced into the gold exchange standard.

2120. Would your requirements be met if the management of the currency were transferred to a real central bank with adequate provisions for holding a gold exchange reserve?—Separate from the paper currency reserve?

2121. No, one single reserve in the hands of a proper central bank who would have the right of note issue and which by statute would have to keep certain reserves?—The difficulty is that, if there is not a separate reserve, there would not be this automatic expansion and contraction, and this automatic expansion and contraction is a vital matter, because they place the gold exchange standard on exactly the same footing as the gold standard.

2122. But if the bank statutes and the law were to provide that the bank was to hold a certain percentage of its note issue in the form of gold exchanges, would not that automatically contract and expand the currency?—The bank is to hold certain percentages of a total reserve for exchange purposes?

2123. A certain percentage of its note issue as a reserve?—For exchange purposes?

2124. For maintaining the stability of money, internally and externally?—I do not exactly follow how this will bring out the automatic operation.

2125. Well, let us suppose that the bank held an amount of foreign currencies as reserves against its note issue. If some of these reserves were withdrawn because there happened to be a demand for foreign currency, the reserves would fall and naturally the circulation would contract, would it not?—Yes, that would be all right, but then the foreign currencies would have to be held in India, so you don't eliminate the cost of transporting the gold. Then all the bills for making international payment would have to be dropped.

2126. I think you have misunderstood me. Suppose a central bank holds a certain percentage of its note issue in the form of foreign currencies, let us say balances in New York. If there is a demand for New York exchange in that country, the bank will release that dollar exchange and would in payment for it receive internal currency. Would that not automatically then contract the currency in spite of the fact that there was only one reserve?—That is to say, the gold standard reserve is to be merged in the paper currency reserve?

2127. That is it.—But it will be held in different places outside the country.

2128. Right.—That will contract the currency in those places; but how will it contract the currency in India?

2129. By the sale of foreign exchange.—Suppose the Secretary of State draws bills on India, then the currency reserve there increases, and when they are presented here then money will be let out and there will be an expansion of currency in India.

2130. I was thinking of the reverse process. I was thinking of a demand for foreign currency and the consequent contraction of the circulation. I was trying to get at the point whether a single reserve operated in that fashion does not automatically contract and expand the currency?—Then if the currency is contracted in India as the result of that, it may not be kept out of the circulation. For other purposes Government may release that money.

2131. I am thinking of the bank. When the notes come back into the bank the notes are cancelled. They don't exist. The circulation is contracted to that extent and the reserve correspondingly.

2132. (*Chairman.*) You would have a fixed proportion of reserves?—It seems that your proposal provides for the automatic operation I want, although I would like to have more time to think of its full bearing in connection with this automatic exchange.

2133. (*Sir Henry Strakosch.*) There is one other point. You said that the time had not come for the fixation of the rupee exchange and you suggested that the reason for the desirability of postponing it is that the countries of the world have not regained their pre-war prosperity, and that trade is on the whole far below what it was in pre-war days. Do you want to suggest that it depends upon the volume of production in a country whether it is capable or not of maintaining the stability of its money?—The volume as well as the fluctuations in the external trade. The fluctuation is more important.

2134. Is it possible for a country to be permanently out of balance so far as its external payments are concerned?—I don't think I follow you.

2135. Is it possible for a country's balance of foreign payments to be upset for any length of time? Yes. I suppose it is possible that the external balance will be upset for some time.

2136. By what process?—There may be a continuous excess of credit over debit by say investing money abroad—not bringing in the money. Or when they postpone the payment of debt for some time, as England did for some time, by selling securities in America and other countries.

2137. But the sale of securities settled the balance. —There would be this upset if the Government did not interfere. I have given you a case where there would have been an upset but Government came and stopped the upset by the sale of securities.

2138. Does it not depend upon the willingness of countries abroad to lend and that willingness may cease if a country continues to borrow abroad on private account, and does not that automatically restore the balance of payment?—In a certain time. Of course in the long run no country can have an obligation of credit over debit. They must be equal.

2139. (*Chairman.*) I think there is one point on which your opinion may be of great value to the Commission. What is your view about the relative advantages and disadvantages of the policy of circulating small notes below the value of Rs. 5?—I think the one-rupee note has become highly popular in big towns at least.

2140. You think the one-rupee note has become highly popular?—It has become highly popular in the big towns at least. Even in the villages we find the one-rupee note is in circulation.

2141. Do you know of any practical or economic disadvantages attaching to the circulation of the one-rupee note?—I have seen it stated that the thing is rather costly, that the one-rupee note deteriorates very quickly.

2142. On the whole you would regret the discontinuance of the one-rupee note?—It has not been

stopped yet I think,—only the Rs. 2½ note has been stopped.

2143. The issue of all the denominations below Rs. 5 has, I think, been discontinued. Do you applaud or regret that state of affairs?—I should regret it.

2144. (*Chairman.*) I do not think there are any further questions. Dr. Basu has given us a very full elucidation of his views in his memorandum, and I should like to express our thanks to him for his assistance to-day and for his helpful memorandum.

The witness withdrew.

Mr. H. L. CHABLANI called and examined.

2145. (*Chairman.*) Mr. Chablani, you are a Master of Arts and head of the Economics Department of the University of Delhi?—Yes.

2146. Since when have you occupied that position? —Since 18 months back.

2147. And before that?—I was for one year at the Elphinstone College, Bombay, five years at Benares as the Head of the Economics Department of that University and before that also I was a professor in a number of colleges. I have been a professor since 1912.

2148. You have been so good as to furnish us with a very full* memorandum?—I am afraid it is rather brief.

2149. I think, though brief, it is most comprehensive. It will enable me to economise time in asking you the few questions that I have to ask. I will try, in the first place, to ascertain which points in your memorandum you specially emphasiso and, in the second place, to elucidate the matter in your memorandum which appears to need elucidation. I understand that the principal views developed in your memorandum are . . .?—May I say one or two words regarding the difficulties that the non-official witnesses experience in giving evidence before this Commission? I would like to point out that they have not got any statistical department at their own houses, and I think the Commission will be facilitating matters very much if the memoranda prepared by Government officials dealing with statistical information are made public property.

2150. A note will be made of your observations. Are there any other observations that you wish to make?—That is the main thing; because the figures that I give naturally will not be so reliable.

2151. We know there are great difficulties as regards access to statistics in all matters of Indian currency, and I may say that the Commission has already experienced them itself, in spite of its command of official sources. Now the chief views developed in your memorandum are that you desire to fix a wide limit within which the rupee should be stabilised, that you are opposed to a gold currency, and that you are in favour of an exchange standard of the sort which you have outlined in your memorandum. The first question which I want to ask you is with reference to the paragraph headed "answer to question 1." At the head of your first paragraph to that effect, you say: "In my opinion, it is premature to stabilise the rupee at any fixed rate in terms of gold at the present moment; Government ought to profit by the mistakes committed in 1920." Apart from the question of American policy—(an exception which you will readily understand)—are not such fluctuations as are foreseen in gold values in your paragraph such as are a permanent feature of the use of gold as an international currency, or is there anything which leads you to suppose that those fluctuations will diminish? —I personally believe that there are a very large number of uncertain factors; for instance, the policy to be adopted by the Central Banks in co-operation with one another. That is a material factor and we know nothing about it. Nor can we say, as I have said in my memorandum, that we can be quite sure as to whether the gold will actually be allowed to circulate in some countries or not. Only two years ago the gold standard was reported to have been re-established in Switzerland and the first report that the public had was to the effect that gold was found to circulate over the counter. So we can say nothing definite. There are many uncertain factors to which I have referred in my written statement. Probably they may clear up in a couple of years.

2152. To take it by steps, first of all as regards the changes in the gold value of the sort referred to in your quotation from Sir John Fergusson, are they not in fact a permanent feature in any country in the world in which the gold standard is generally adopted?—Yes, that is true in a sense; but we hardly know what the demands of the world would be for monetary construction.

2153. Now taking the special circumstances to which you refer, you say that there is a doubt as to what might be the result of the possibility of co-operative action between the Central Banks. Have you contemplated the fact that it may be said that at the present time there is effective co-operation between the Central Banks, in so far as there is consultation for the purpose of controlling the gold demand between the Bank of England and the Federal Reserve Board, which are perhaps the two most important authorities in question. In a word, do you think that, as a matter of fact, effective co-operation between the most important controlling forces may be said to have been already achieved?—I do not think it has been achieved. Undoubtedly the Central Banks and the Board seem to be agreed; but we do not know whether co-operation is going to develop fully on the lines which the Geneva Conference contemplated, viz., a settled discount policy, a settled policy regarding the purchasing power of gold in the various countries.

2154. If you have the Bank of England and the Federal Reserve Board co-operating as regards the discount policy and the distribution and control of gold supplies, do you think there is anything very important in the way of further co-operation to be added to that state of affairs?—I do not see how it is going to develop. It may be all right for the present. But I cannot say what is going to happen in the next few months.

2155. You distrust the continuance of that co-operation?—Yes.

2156. You refer also to the possibility in future of an increase in the demand for gold for circulation?—Yes.

2157. Is it not the fact that the chief countries which ever have made use of, or are ever likely to make use of, the gold standard have adopted the gold exchange standard as their deliberate policy?—They are on the way to adopt it; but they have not adopted it.

2158. Omitting the case of France?—Italy.

2159. Italy, you say, is on its way to adopting it, but it has not yet succeeded in establishing it?—Yes.

2160. Is there anything which leads you to suppose that Italy is likely to proceed from the adoption of a gold exchange standard to the further stage of a gold standard and gold in circulation?—I at any rate do not feel quite certain. The probabilities are that it will develop on the lines of the gold exchange standard and gold will not be allowed to circulate. But I gave the example of Switzerland. There can be no reliance at all.

2161. Your own view is that the gold exchange standard is the best?—I would not use the phrase "gold exchange standard." I will avoid it.

* Appendix 13.

2162. What shall we call it?—I will call it a gold standard.

2163. By gold standard, you mean in that connection what?—The gold exchange standard as practised in India in pre-war days did not mean that the rupee was legally and freely convertible into gold inside the country. It was only convertible into gold outside the country. The system which I contemplate makes it convertible in either country; only it makes it convertible into gold bullion so that gold coins will not circulate.

2164. I am afraid we have run aground on the question of nomenclature. The question I want to ask you is this: If you are of opinion that the system on which internal currency is convertible into international currency and not convertible for internal use is the best system, and if you find that system being adopted by the chief nations of Europe, I should like to try and appreciate, if I can, why you think those nations are likely to abandon the better standard as you describe it and to continue their development by demanding a gold circulation. I appreciate that you think so, but I have not yet arrived at the reasons why you think so?—The reasons which I have given—taking all together—are all directed to point out that there is some uncertainty in the value to be attached to gold. For instance, the United States would like to produce a fall in prices to enhance the value of gold. It is a balance between a selfish policy and an enlightened policy that the United States may adopt. My main point is that at the present moment, we are very much dependent upon the United States and naturally the United States would not allow a very great rise of prices because it will depreciate enormously the obligations that ought to be paid in gold to the United States and it may probably desire to produce a fall of prices. After all the people of the United States are not philanthropists and in the interests of the world they are not going to sacrifice their own interests.

2165. Referring to what you say in your memorandum about the possibility of inflation in America, is not there always a possibility of inflation in some country?—Yes.

2166. Is it any good waiting for a time at which it will be possible to escape from the possibility of there being inflation in this country or that?—All that I want to say is that at present there is a large stock of gold accumulated in America. After a time when these stocks have decreased, the fluctuations that would be introduced by a policy of the United States will not be so great.

2167. Do you consider that the presence of a large stock of gold in America increases the danger of there being an inflationary movement in the United States rather than in any other country?—All I say is that the factors are uncertain. Just as inflation is likely, deflation is also likely.

2168. I am trying to ascertain whether there is any factor at the present time which makes things more uncertain which, by waiting, may be removed. You refer to the danger of inflation, and I suggest to you that there is always a danger of inflation at any time. By waiting can we get rid of the danger of inflation?—Yes; because the accumulation of the stock of gold will be less in the United States.

2169. You think that the presence of a large stock of gold in the United States makes it more probable that there will be inflation there?—It rather gives it a greater power to produce inflation.

2170. Why should it give it greater power?—Because they have abundance of gold.

2171. Is it not the case that the desire to inflate makes it probable that that is the thing that will happen?—If gold were distributed evenly in the world then the movements of gold will act as a check upon the rise of credit.

2172. You say quite rightly the United States should not be regarded as a philanthropic institution. As regards the interests of the United States themselves, can you see any motive which the United States might have for making use of their stock of gold in such a manner as would upset world prices and exchanges?—I believe they will desire,—at any rate a steady tendency to a fall in prices which means an increase in the value of gold.

2173. I think you have expressed your belief, in the course of your memorandum, that there will be a growing scarcity of gold in the course of the future history of the world?—Yes.

2174. I suppose that if that might be looked upon as a set-off, if one might put it so, against the large stocks of gold in the United States, the growing scarcity will, in the course of time, provide a natural means for the absorption of the gold stock in the United States?—Yes.

2175. And thus tend to reduce any tendency there might be towards disturbance of prices by inflation?—Towards inflation, yes.

2176. Now as regards these general changes in the world's gold prices to which you refer as a circumstance pointing in the other direction of present stabilisation, the processes to which you refer are such, are they not, as will take place in a gradual manner; or have you in mind, in these changes in gold values to which you refer, any sudden and violent changes. I mean, you refer to the decrease in the world's gold supply. You refer, by quotation from Sir John Fergusson, to the cheapening of industrial processes and so on. Are these not all gradual processes which will take place slowly?—They would take place slowly, but even in England at the present moment I cannot take for granted that sterling is absolutely stabilised in terms of dollar. The recent changes show . . .

2177. I should like to take the question of English stabilisation separately. I want to ascertain, if I can, if, apart from the circumstances to which we have referred, there is any possibility of a sharp disturbance to the value of gold prices which you have in mind as a danger ahead?—Yes, I have in mind the very stability of the sterling in terms of the dollar.

2178. Let me take that next as it comes next in the process of your thought. You say: "There is still a certain maladjustment between sterling and gold prices," and I understand you to say that you look upon it as a possibility that there will be another sharp divorcement between sterling and gold. You refer to the recent change. Has that recent change not been the result of the final step in the return to the gold sterling standard in Great Britain? You say here: "Since January last sterling prices have shown a downward trend," and so on. Have not the recent changes in the value of sterling in relation to gold been, the result of the final step taken when the policy of the Government was announced that the pound sterling was to be on a parity with the sovereign?—Yes.

2179. Therefore it is a limited process which terminates as soon as the pound sterling and the sovereign have established themselves at parity?—No. Mr. Keynes' calculations show there is a disparity of 10 per cent., between the purchasing power parity and the cost of living index in England and the United States.

2180. You look forward to a further change in price levels in Great Britain?—Yes.

2181. I put to you the hypothesis that the exchange movement of the pound sterling has anticipated that change in prices which has still to take place, and that the change in prices which has still to take place (assuming that it still has to take place) is no more than the adjustment of British prices to a rate of exchange which is already established?—It is a possibility; I cannot rule that out, but there is the other possibility as well.

2182. Is there any further cause in your mind to expect a further divorce between sterling and gold?—Well, the adverse balance of trade. In 1924 there was an adverse balance. I have not the latest figures before me.

2183. (*Sir Henry Strakosch.*) Of trade or of payment?—Possibly of payment to.

2184. (*Chairman.*) That will raise the question whether, in your opinion, the reserves of the British system are adequate to maintain stability in face of what we shall no doubt agree can only be a temporary adverse trade balance. In your opinion are they adequate or not?—Well, they appear adequate. I notice that the centralised store of gold in England is about 154 million pounds.

2185. We must remember the temporary credits of New York, must we not?—Yes. But we must also remember the liability in the shape of the deposits. The centralised store of gold, against that you have to take note also of the deposits of currency.

2186. You mean American money in England?—In considering the stock of gold you have also to consider the internal needs of gold as the basis of the credit system.

2187. In your opinion, is there anything unsound in the proportion of reserve kept by the Bank of England against the structure of internal credit?—Well, I do not think there is anything unsound considering the fact that the gold does not circulate now in England and the reserve is centralised in one hand.

2188. So that you do not observe any elements of weakness?—The elements of weakness are safeguarded by the credits which have been arranged for in America.

2189. We have not yet arrived, have we, at any element in the situation of the central finances of Great Britain, apart from the one which we have already examined, the maladjustment of prices, which would suggest to you the possibility of any further divorcement between sterling and gold?—So far as maladjustment is concerned?

2190. You are referring now to prices. Unless you have anything to add, I would not go back on that because I have got that clearly in my mind. It has taken me a little out of my path, but it is very useful to clear up that point. Apart from the question of a possible divorcement of sterling and gold, do you see any other circumstance which is likely to cause other than a gradual alteration in the value of gold in relation to commodities?—Yes, there is the demand for monetary reconstruction in the world.

2191. Yes, we have dealt with that too. Supposing, if I may ask you to meet me on a supposition, there are no other conditions than such as would produce gradual alterations in the value of gold of a rate such as those which we saw before the war, would you then say that conditions have become favourable for stabilisation at a fixed rate?—Yes.

2192. (*Sir Henry Strakosch.*) I would like to ask some questions with reference to certain statements you made. First of all, regarding the redundancy of gold in the United States of America. You are no doubt aware that the United States had to absorb something like 523 million sterling of gold. Would you say that American prices have been particularly unstable in spite of this influx of gold?—No, they have been managed prices, practically speaking. It is not left to the automatic working of the gold standard.

2193. In fact, is it not fair to say that prices in America since the beginning of 1921 have been practically stable right through?—Well, I have not got the figures before me.

2194. I have the figures, and if you like I can show them to you. Then what do you ascribe that to, that stability in spite of the flood of gold which went to America and which uncontrolled ought to have sent up prices sky-high?—The Federal Government did not allow it.

2195. Therefore it was the policy of the currency authorities in the United States to avoid a rise in prices. Does that not indicate that they are fully conscious of the necessity of maintaining prices stable?—In America, for the time being.

2196. America alone being on the gold standard, they have appreciated that it is essential for gold prices to remain stable, and they have managed it exceedingly well in spite of an overwhelming flow of gold there. What entitles us to suppose that the United States will depart from this policy when the flow of gold has to a large extent subsided?—Its interests abroad. It is interested in the fall of prices, being a creditor nation to which all other countries have to make payments.

2197. But having had the opportunity for the last four years to turn the scale in its favour and not having taken it?—It had not the opportunity because all the opportunity that it had was to raise gold prices which must produce a fall in the value of gold, but I am talking now of the rise in the value of gold.

2198. Is it in the interests of the United States that the purchase price of gold should be greater?—It should be greater.

2199. And how do you think that will be achieved?—By parting with a little of its gold for the monetary reconstruction of the world and by regulating the rate at which it would part with gold.

2200. How could they benefit the world by parting with their gold and at the same time depress prices?—Yes. All that I say is that it will part with a portion of the gold, in such a fashion as on the one hand to lead to the use of gold as a reserve for currency purposes, and on the other hand to lead to such a demand for monetary reconstruction as will raise the value of gold; because it is interested in having a much greater purchasing power for the stock of gold it holds.

2201. According to the statement you have just made, it must part with the gold in order to reconstruct the world?—That, as I said, is a compromise between enlightened policy and its own interests.

2202. How could the world be reconstructed if you have a period of falling prices; in other words, instability of prices? Obviously, you cannot reconstruct the world by creating a condition of instability?—But you can create a condition of comparative stability and yet produce slowly a fall of prices.

2203. But that would impede reconstruction, would it not?—Not necessarily. There have been cases when, in spite of a fall in prices, there has been economic progress.

2204. Why should the Conference at Genoa have been so terribly afraid of gold becoming scarce and prices falling in consequence, and therefore advocated the universal adoption of the gold exchange standard?—Because if all the nations began to compete for the supply of gold that America has, they will bid a higher price for it; this is to stop that competition.

2205. Exactly. Therefore the world, one may say, realises that a fall in prices is injurious, especially during the period of reconstruction?—Quite true: but the question is how far that realisation in thought is going to lead to co-operative action.

2206. Would you say that, if the redundant stock of gold held by the United States were divided up amongst the other nations, the greater the area of countries that embrace the gold standard, the less likely will it be that the United States could control the movement of gold prices?—Yes.

2207. You agree?—Yes.

2208. Do you realise that at the present moment there are countries in the world inhabited by about 170 million people who have already embraced either the full gold standard or the gold exchange standard?—Yes.

2209. And that the United States population is 115 millions, and that the process is continuing?—Yes.

2210. Might one therefore not suppose that the United States is not almighty in controlling gold prices?—Will not be almighty after a time; it is almighty at the present moment.

2211. At the end of 1924, according to the work of a very eminent statistician, the United States of America then held 44·6 per cent. of the total stock of gold money in the world and the balance was held by other countries?—I am sorry I have not got the figures.

2212. You may not have, but I believe they are correct. 44·6 of the world's gold money was then held by the United States and the balance in other countries. Therefore, as the area of gold standard countries increases, we must suppose that the power of the United States to control gold prices will diminish?—But the power of the United States to control gold prices proceeds not from the fact that they have a particular quantity of gold at the present moment, but that they have a greater surplus to spare than any other country. Other countries have got a deficiency in their supply, and therefore are not in a position to control the value of gold.

2213. Would you say that Great Britain has a deficiency in the supply of gold?—If we consider that Great Britain aims to be the international money market of the world, I should think there is need for more gold in England.

2214. Do you know the amount of gold in Great Britain now?—About 154 millions.

2215. Do you know what it held before the war?—Yes. But you must remember also that before the war nearly 120 millions was in circulation according to one estimate.

2216. I think that is rather an over-estimate?—Besides, there was a large amount of gold in the other banks. Now the whole stock is centralised.

2217. Would you call gold in the pockets of the people available for international purposes?—To a certain extent.

2218. But only to a very trifling extent, I suppose?—I would not say that it would be as servicoable as a central stock of gold, but in the case of an adverse exchange it is useful.

2219. One other point. You referred to maladjustment of prices in England, and in your memorandum you say that there is still maladjustment of prices. You have no doubt followed the movement of gold prices in the United States and in Great Britain?—Yes.

2220. And no doubt you will have observed that gold prices in the United Kingdom have been steadily falling from 175 in January, 1925, to the present figure of 158?—May I know what Index number you are taking?

2221. These are the Federal Reserve Bulletin figures; these are the wholesale prices?—From my comparison of the cost of living index numbers, the difference is to the extent of 10 per cent.

2222. The cost of living index is hardly the index to take as a measure of the level of general prices?—If you want to know whether the wages have adjusted themselves to the new conditions, you have to take the cost of living index number.

2223. Even accepting that, has not the movement been very strongly towards parity with United States gold prices?—There is a 10 per cent. difference.

2224. I know exactly what you are referring to. You are speaking of a pamphlet issued by Professor Keynes some little time ago; but the world has not stayed still since then; prices have gone down as indicated by the wholesale index?—Yes, prices have gone down.

2225. If you take 1913 figures at 100, you will find that the United States prices to-day are 165 and British prices 158, practically in adjustment, if not in favour of Great Britain?—You are not taking the index number of the cost of living at all.

2226. Because the wholesale index is generally accepted as the best measure of general prices?—But that will not give us the true purchasing power parity, only a rough guess.

2227. I won't go into that question, but I think I am right in saying that the purchasing power parity is worked out as a rule by taking wholesale indices, not retail indices, because all these retail and cost of living indices vary very widely according to the countries?—Not of all articles. The proper index number to take would be the index number of prices of particular commodities that enter into international trade.

2228. You refer to an adverse balance of trade in Great Britain. Do you suggest that there is an adverse balance of payments?—There was an adverse balance of trade, which must lead to payments being made.

2229. But the balance of trade does not include what is generally called the invisible exports and imports trade?—It does not.

2230. Very well. Can you therefore judge from the balance of trade what the balance of payments is?—I cannot be certain of it.

2231. Then I suggest that the statement that there is an adverse balance of trade requires modification?—I only said that with a view to pointing out the probability of uncertain factors.

2232. But would you be surprised to hear that Great Britain is still in a position because of its favourable balance of payment to invest something in the neighbourhood of 50 millions sterling a year outside the country?—I would not be surprised.

2233. Then why should that be an unfavourable feature for the future stability of money and prices?—Because Great Britain cannot altogether give up the idea of lending money to other countries. It has to think of other countries too.

2234. Within its means?—But it has got to think of its imperial interests.

2235. (*Chairman.*) It cannot go indefinitely lending money it has not got?—It can borrow at a cheaper rate and lend it at a higher rate.

2236. (*Sir Henry Strakosch.*) Have you heard of any borrowings of Great Britain abroad?—The fact that they have large credits in the United States shows that they will borrow money when required.

2237. But have they done so?—They have not; all that I am arguing is that it is uncertain, and that you cannot say what they are going to do.

2238. (*Sir Maneckji Dadabhoy.*) I understand you to say that you consider it premature to stabilise the rupee at a fixed rate in terms of gold?—Yes.

2239. For two main reasons; one is, I understand you to say, the want of effective co-operation between the Central Banks, and you also think that we are not at present sure of what is going to be the future policy of the United States with their huge stocks of gold. You cannot say, therefore, what will be the future price of gold?—My general ground is that the future trend of gold prices is uncertain; others are merely sub-reasons.

2240. All the factors regarding the supply and demand of gold are uncertain; among them the main reasons which you have mentioned are only two?—Weighing the factors on one side and the factors on the other, we oannot be sure what is going to be the net result.

2241. You apprehend, therefore, that there may be a fall?—But I do not rule out the possibility that there may be a rise, and then also there is going to be instability.

2242. Is it in the interests of the United States with all the stocks of gold at their command to manipulate a fall in price of gold?—I should think so. How?—Because they have to receive payments from others in gold.

2243. (*Chairman.*) That, I think, was Mr. Chablani's previous answer to Sir Henry Strakosch.

2244. (*Sir Maneckji Dadabhoy.*) It is not clear. Would not the effect of the United States parting with gold take away from that country the power to control prices?—The more it parts with gold the less will be its power.

2245. Now I want to come to the question of the new rate. You express the view that the authorities can, without any very great risk, announce that they will use all their resources to keep the rupee between 1s. 4d. gold and 1s. 6d. gold. As I understand you, the policy you recommend is that the machinery of an exchange standard should only be brought into operation in the event of a rise above 18d., and in the event of a fall below 1s. 4d.?—Yes.

2246. That leaves a very wide limit for the fluctuation of exchange. Do you consider that it would inflict any detriment upon both the international and the internal trade of the country that exchange should be free to fluctuate between those very wide limits?—I believe it will make for a greater certainty than exists at present. Even these wide limits are narrower than the limits possible otherwise.

2247. I understand from your argument that one must not compare this proposal with stabilisation at any given rate, for the reason that you do not believe that any given rate could with certainty be maintained?—Yes.

2248. But there has been a very substantial approach towards stability of the exchange rate, has there not, in the course of the past six months or a year?—Yes, there has been some approach, and the policy of Government has tended to practically fix it at 1s. 6d.

2249. Has not that approach to stability been due to the circumstance that 1s. 6d. has been chosen, for instance, as the rate above which exchange is to be prevented from rising by the use of the methods of the exchange standard system?—Yes.

2250. Supposing one were to throw tho limits open so widely as you propose to throw them, would that not increase uncertainty and tend to the loss of such stability as has already been gained?—I do not think that it will create greater uncertainty. Because after all Government would be expected to follow the policy of stabilisation as much as possible even after you fix these limits.

2251. Supposing there was a downward tendency in exchange from the present rate, and it is known that there is to be no use of the resource of stabilisation until 1s. 4d. is reached, is it not likely that there will be many more fluctuations between 1s. 6d. and 1s. 4d. than there would be if one were to make use of the exchange standard machinery to keep the rate as long as possible at 1s. 6d.?—All that I said is that the Government should make the attempt to keep the present rate as far as possible; but suppose the forces are beyond its control. That is why I do not want to fetter the discretion of Government.

2252. You think that Government, or whoever is in control of the machinery, should use that machinery to keep the rate at the present rate as much as possible?—Subject to what I have said afterwards as to the effects of the tariff. It would have been the proper rate if there had been no high tariff or protective legislation.

2253. If that be so, the authorities would not permit the rate to fall away from the present level unless it was obliged to do so by forces beyond its control?—I am more inclined to 1s. 4d. than 1s. 6d., for the reasons that I have stated in my memorandum. In my opinion, considering the high tariff, the rate should be 1s. 4d.

2254. It is not very relevant to my present question whether it is 1s. 4d. or 1s. 6d. Supposing we take some rate, the present rate or substitute 1s. 4d. as the rate to which Government is to keep the exchange as stable as it can, what *then* is the object of choosing some other figure with a wide margin between that figure and the present figure as the furthest point beyond which exchange is not to be allowed to move? Is that not introducing an unnecessary condition?—No, there will be the certainty that the Government has a settled policy not to allow the lower limit or to go further away beyond the upper limit. At present there is no certainty in the market. People will be speculating at 1s. 8d. or even at 2s.

2255. If it is to work to 1s. 4d. you recommend that it should not have to go away from 1s. 4d.?—Yes.

2256. Supposing the rate is forced up to, say, 1s. 6d., would you allow it to go beyond 1s. 6d.? What is the object after inserting one peg to insert another? If one peg goes the other goes?—The object is this. So far as the upper limit is concerned, it is within the power of Government to control it absolutely because Government can put in as much currency as they like. They can expand currency and bring it down to 1s. 6d., even if there was a tendency to send it up; and the market will be sure, that there will be no financial stringency in the market, and the Government with imports of gold will come in for 1s. 6d.

2257. Now we arrive at the next point, in which you express a strong preference for a gold exchange standard to a sterling exchange standard, for the various reasons given?—Yes.

2258. Have you considered in this connection, tho practical conveniences of having your exchange related to the currency in which the great part of the trade of the country is settled?—Yes.

2259. What importance do you attach to that circumstance?—I believe if instead of a sterling exchange standard we have gold exchange standard as permanently fixed, the rate would be fixed in gold. More such transactions will be transacted in gold.

2260. I do not quite follow you, I am afraid?—At present most of the transactions which India enters into are settled in terms of sterling, but should there be any doubt about the parity of sterling with gold I expect that the transactions would be transacted more in terms of gold than in sterling?

2261. Not only " may be " but it is the case, is it not, that the great bulk of India's foreign trade is settled atually in sterling?—Yes.

2262. I understand the effect of your answer is that, as long as gold is not separated from sterling, then there is no difference between the two standards. But supposing there is a slight temporary divorcement between gold and sterling, does it not introduce complications and difficulties in regard to India's foreign trade?—It does to a certain extent, but the stability of the standard is very much greater if we are independent of the course of prices in England.

2263. Assuming, as I have for the sake of my question, a temporary and slight divorcement only, you are then, are you not, incurring a practical inconvenience for the sake of a theoretical perfection?—It may amount to a theoretical perfection at the present moment.

2264. It would only become of practical importance in the case of a further prolonged and large divorcement?—Not only that. It does create a certain amount of confusion in the mind of the administrators. In 1920 we went on raising prices in India because prices rose in England.

2265. Of course that was a conspicuous instance at that time. I am not sure that I have really followed your proposals as to the manner in which the reserve should be held on the system you recommend. In what form would you propose to hold the reserves?—In gold bullion.

2266. In gold bullion only?—Yes.

2267. The whole mass of the reserve?—No.

2268. I know you somewhere express the opinion that there is no reason why a portion should not be held in credits in foreign countries?—Yes.

2269. In what form of credits are you contemplating the holding of your reserves there. I am not talking about the actual form of securities but as to their allocation?—In India.

2270. I mean the foreign?—Of course preferably it will be in English securities mostly.

2271. You are not suggesting, as some witnesses suggested, that it would be essential to hold some of the securities in each of the large gold standard countries?—I do not think we ought to aim at a theoretical policy of no risk absolutely; but if for instance a small portion is held in United States securities it might be convenient for some time to come, as the United States at the present moment is one of the best centres for gold.

2272. Would it be of any practical utility in regard to the settlement of India's trade and the conditions under which it is likely to be used that a proportion should be held in the United States?—I do not think that there would be any practical inconvenience.

2273. I do not know if you are prepared to express any opinion as to the proportion of the internal reserve which you would think it right to hold in gold under those conditions?—No, I am not. I have said with regard to the currency reserve that it should be about 60 per cent.

2274. I think that will come in more conveniently on a future question.

2275. (*Professor Coyajee.*) Coming to your answer about protection, you do not suggest that it is for the State to control and counteract the natural movements of exchange in the interests of the protected industries?—May I know what you are referring to?

2276. I am referring to your answer to question 2 in the memorandum. You say there in answer.—" But that was exactly the object of recent protective policy and the expected result of a high tariff. Certain classes will no doubt suffer from such a policy; but rightly or wrongly the country as a whole consented to pay this price. And Government cannot be allowed to neutralise by its currency policy and the consequent rise in the normal rate of exchange to 1*s.* 6*d.*, the intended effect of protectionist tariff ". But is it for the State to counteract internal modifications of exchange in the interests of protection?—It is not in the hands of trade to control price levels in India; that is in the hands of Government.

2277. To control price levels?—Yes. What Government has been doing since 1922 when the exchange was at its lowest was to produce a fall in prices. In fact the prices have gone down under the effect of contraction. If I may give you the figures—Bombay index No. was 192 in the month of February 1922. It went down in 1925 to 158, while the United Kingdom index number went down by February 1922 only to 158.

2278. Then you say the fall of prices here has proceeded to such an extent as practically to neutralise the intended effect of protection? Then the cost of production of these protected industries will also fall?—The effect of the tariff is on prices as a whole, not merely on prices of the protected industries.

2279. And similarly, if general prices fall, the general wages will also fall? Therefore, protected industries will not lose as you suggest by the fall in prices?—My argument is on quite different lines. What I am pointing out is this, that if the currency policy of India had been the same as before the war, the effect of high tariff would have been to produce a difference of price level betwen India and England. That difference of price level has not now been attained. Since February 1922 prices have fallen in India while the British prices have remained the same. It is not the mere fall of Indian prices that matters. If the Indian price level fell and the British fell to a less extent, the required differences between the two would not have been destroyed.

2280. But what the manufacturer is concerned with is the difference between the price of his cost of production?—Yes.

2281. Then the same factor that lowers prices here must also lower wages and the other costs of the protected manufacture?—Yes, eventually.

2282. Therefore he cannot lose as you suggest by the fall in prices?—But he does not get any protection against English goods, because their rupee price also goes down. There is no difference between the situation in 1913 and now in spite of the protective tariff because there is no difference in the price level. Both have risen to the same extent since the War while Indian prices should rise to a much greater extent to preserve the difference due to protection.

2283. But if the price had remained steady, the cost of production would have remained steady. Is not the producer interested in the difference between his price and his cost of production?—But the price which he gets is determined by the foreign conditions—It is the price of the imported commodities. If that is lowered down, he can't maintain the price.

2284. (*Chairman.*) Is it your argument that tariffs confer no protection at all on the manufacturer at the present level of prices?—My argument only is that the difference which ought to exist on account of a protective policy between prices in India and England does not exist.

2285. You arrive at that by comparing the general Calcutta index with the English index?—Yes.

2286. You have observed no doubt by reference to that Calcutta index number that the prices of the articles of the type usually exported from India are on the whole below the average resulting index number, and that the price of the articles imported into India are as a rule above the resulting average index number; and it suggests itself to me that the prices of the articles which are imported and are liable to tariff are really substantially higher in India than they are in Great Britain?—I don't mean to say that the difference in the cost of production of the English manufacturer and the Indian is absolutely cancelled by this fact. Considering the figures of trade I am rather inclined to think that it has not quite succeeded in this—but the tendency is there.

2287. If you will look at the index number of articles imported into India you will find that the prices are higher than the prices elsewhere, higher even by a larger margin than that which you might expect from the tariff. Would you agree, from your acquaintance with the subject, with these figures?—As a matter of fact imports have been discouraged, in spite of the rise in exchange.

2288. There has never, perhaps, been a tariff which has not exercised some effect in discouraging imports?—I think the real reason why the imports have been discouraged is that their prices in India are still too high for the purchaser in India.

2289. (*Sir Purshotamdas Thakurdas.*) Mr. Chablani, in the last sentence of your reply to question 2 you suggest that Government should maintain the value of the rupee between 1s. 6d. and 1s. 4d., gold. In reply to question 4, one of the main changes suggested by you is that the rupee be made freely convertible into gold bullion at the rate of 1s. 4d., gold. That means that you make gold available on the basis of 1s. 4d.?—No. I do not suggest that as an immediate change but as part of the permanent policy to be adopted.

2290. What would you recommend as an immediate change? On what parity is the rupee to be converted into gold?—I say that Government should offer gold in return for rupees at the rate of 1s. 4d.

2291. At 1s. 4d. That is what I say. Therefore in the statute where we have at present two shillings put in by the legislation of 1920, you would substitute 1s. 4d.?—But in the existing statute there is no provision at all.

2292. I mean gold equivalent at these rates?—No, the Government does not offer gold at that rate in India.

2293. No, but if you offer it to them they would pay you on the basis of two shillings. Instead of that you would substitute 1s. 4d. Government would not only take gold and give you rupees at 1s. 4d., but they would also give you gold at 1s. 4d?—But I say Government should give rupees in return for 1s. 6d., at present.

2294. That is, Government should undertake to give you gold at the rate of 1s. 4d?—They would give you gold on the basis of 1s. 4d., and they would take gold from you at the rate of 1s. 6d.

2295. May I understand it? If you took a sovereign, Government would give you Rs. 13 as 6?—Yes.

2296. And if you wanted a sovereign, you would have to pay Government Rs. 15?—Yes.

2297. Government would have two scales—one scale for receiving gold and another for giving gold?—Yes, for the time being.

2298. How do you think the people here would construe it? I mean surely if they had two different rates to receive and pay, how do you think the people of India, the masses, would construe this change?—For the present I am afraid 1s. 4d. would be practically inoperative. People won't give Rs. 15 for a sovereign.

2299. Exactly. If you fix a rate, then it must be the same rate. You make gold available at the same rate so that Government may be able to give you gold.—I don't agree.

2300. In the case of gold being minted here has there been any precedent for this? Have you heard of any country in the world having received gold at one rate and given at another, for the stabilisation of the currency policy?—I am only advocating it as a policy of transition till you have settled the course to be adopted.

2301. When do you think that period of transition will end? How long will it last? What will be the symptoms by which we should be guided for the termination of this transition period?—I would say till you find the majority of the countries of the world with which you traded have come to the gold standard.

2302. That is to say, till central Europe has revived its trade?—Yes.

2303. Is not what England has done sufficient for India? England appears practically to have said to herself, the condition of Central Europe and the revival of her trade has been put on a basis which is good enough for gold standard. Isn't that good enough for India?—It is quite good enough.

2304. Then why do you put it off for India?—I am not putting it off. I am only putting off the fixing of the rate.

2305. You are putting off the rate because the conditions to your mind are very uncertain?—I doubt the ability of Government to maintain a particular rate.

2306. Do you doubt the ability of the United Kingdom to retain her parity?—To a much less extent.

2307. In fact, you feel very pessimistic regarding the apparent settlement in the important countries of the world?—No, I don't.

2308. You don't?—Conditions have been moving a bit fast during recent months.

2309. Do you expect some disturbance?—If there is to be a disturbance we should not be unprepared.

2310. But why should there be a disturbance?—I have already explained the circumstances.

2311. (*Sir Purshotamdas Thakurdas.*) And my point is that when we are considering the question of what is best for India you are not putting before us any special reasons how trade conditions in India debar you from stabilising your exchange. You say because things are not yet settled down in Central Europe.

2312. (*Chairman.*) Sir Purshotamdas, do you remember the answer in which Mr. Chablani referred to co-operation between central banks, the possible demand for gold in circulation and possible inflation in the United States? I think he has already answered your question in a little detail.

2313. (*Sir Purshotamdas Thakurdas.*) I have no doubt, Sir, and I only mention this because I want to know if Mr. Chablani can tell us how long this period of transition he has mentioned just now is likely to last?—Well, I, personally, believe probably, as things go, the central banks may come to an understanding very soon.

2314. Then as soon as the central banks in Europe come to an understanding you would feel safe in stabilising the rate in India?—I should think so.

2315. Now, until the central banks in Europe came to an understanding you would not feel yourself confident of going ahead?—Probably other circumstances also may change and justify stabilisation even without the co-operation of central banks.

2316. But this is the major one?—It is a thing that might come about much sooner than anything else.

2317. Until that time you would recommend that the Government of India should have two rates, one for giving gold and another for receiving it?—One would be practically inoperative probably for some time.

2318. Which do you expect to be inoperative for some time?—The lower rate. But it will be an assurance that beyond a particular level the rate will not be allowed to go down.

2319. I see. Your idea is to fix the two extremes and get Government committed to them. The uncertainties you have in your mind when you say you must not stabilise do not frighten you from having the two extremes. You think they are wide enough?—Yes.

2320. Are these two points not much too wide for practical purposes for the trade and commerce of India?—They would be wide if Government are supposed to use their discretion arbitrarily in manipulating the exchange. The Government in the interests of the country has actually been manipulating the exchange during the last six months, and I do not expect there will be any greater uncertainty. It does not mean that the Government would oscillate between the two extremes now and then.

2321. It would give the Government a good scope in which to go on playing?—In view of the uncertain factors, Government ought to have some latitude.

2322. (*Sir Henry Strakosch.*) With regard to your proposal to fix the gold point at 1s. 4d. and 1s. 6d., I want to be quite clear what your misgivings are with regard to the possibility of the authority entrusted with the management of the currency maintaining the rate of exchange that may be determined upon. What are the difficulties that you foresee?—Supposing the gold prices fell in England, it would be very difficult for Government to maintain 1s. 6d. without deflation. Or supposing prices fell even further so as to jeopardise even the 1s. 4d. rate, if at that moment Government wanted to maintain 1s. 6d., it would simply mean ruining the country by creating a serious financial stringency.

2323. In other words, you are afraid of a violent movement of gold prices abroad? You prefer to see stable prices internally in India?—Yes.

2324. That is the aim you have in view?—Yes, after having fixed the rate at 1s. 4d. and bringing about the price level at which the purchasing power parity would tend to 1s. 4d.

2325. I am speaking of the period when you wish to fix the gold points between 1s. 4d. and 1s. 6d. What is to be the central aim of your policy during that period? Do you wish to keep prices stable in India in spite of what may happen abroad?—Yes.

2326. Now, do you think that is really feasible, having fixed the two gold points?—Yes, I should think it quite feasible, if Government only exercise discretion in the same fashion as now.

2327. May I give you an illustration? If by any chance the rupee were to appreciate to 1s. 6d., the two gold points having been fixed, is it not clear to

everybody that Government will do, or the currency authorities will do, everything to maintain the exchange value of the rupee at that price, and that it cannot go higher, and would that fact alone not be giving to anybody a free option for the fall of the rupee, and would not that free option be taken advantage of by speculators, by importers of goods, and so forth?—I am not quite clear as to what you mean.

2328. I am trying to show that it would be extremely difficult for you to maintain that level of prices completely, independent of world prices, and for that purpose I am taking your proposition of fixing the extreme limits of fluctuation of the rupee between 1s. 6d. and 1s. 4d., and I say this, that if the rupee were to reach 1s. 6d. would that not be a direct inducement to people borrowing in India to purchase foreign currencies, to lend money abroad, to purchase goods abroad, that is to say, to over-import and to retard exportation; and would all these factors not tend to depress the value of the rupee? And would the reverse not be the case if the rupee were to depreciate to 1s. 4d.?—All that I say is that the speculator will also know that, beyond a particular point, exchange is not likely to go down or go up. He also speculates within certain limits; he knows that to speculate beyond a particular limit would be unsafe in view of the Government policy.

2329. But if you admit that what I have just said is true, then the value of the rupee is going to be thrown towards world prices all the time. And you will not be able to maintain, quite apart from world prices, a level for India?—I do not mean to say that I would be able to maintain it, absolutely independent of gold prices.

2330. I am speaking of gold prices. You wish to keep Indian prices stable at a given point in spite of the fact that the world gold prices depart from that point? And I am trying to show that it would be extremely difficult for you to achieve that. If you fix your gold points within these margins, you would have given an upper limit and you would have given a lower limit and the action and reaction which follows from reaching those points would throw your prices towards world prices?—They would, within limits.

2331. But those limits are given—1s. 6d. and 1s. 4d. —and it is conceivable that you would not be able, if the world prices were to deviate so much from Indian prices, to maintain the 1s. 4d. and 1s. 6d.?—After all in these matters some risk has to be taken. A sufficient latitude has to be given to the Government and the risk has to be taken.

2332. Just imagine the economic effect upon India of having a margin between the stabilization point of 12½ per cent.—prices moving 12½ per cent. up and down; in the one case, as I have pointed out, driving the resources of India abroad, inducing heavy importations, retarding exportations, at the one point and the reverse process at the other point?—At the most the result would be that prices would rise to a level which will justify 1s. 4d. rate. Supposing speculators were to bring about a rise of prices in India, the rise of prices would be towards the length of 1s. 4d.

2333. But what actual facts have you got to prove that the 1s. 4d. rate is the proper rate? If, as the indices rather indicate, internal prices in India are on the way to adjusting themselves to the 1s. 6d. rate, what makes you think that the proper rate is 1s. 4d.?—As I said, I want to produce a difference in prices between India and England to the extent justified by the tariff, which is about 12½ per cent. on the average.

2334. But you cannot permanently produce a difference in prices between England and New York? —Yes, a tariff can. But you are manipulating prices under the present system.

2335. What happens, I think, is that only during the period of adjustment can you keep prices away from parity. There is no advantage to you whether you fix it at 1s. 4d. or 1s. 6d. except during the period when internal prices are adjusting themselves? —I am considering the present situation of prices in England and India and I find that 1s. 6d. practically does not maintain the difference between prices in India and England which ought to exist.

2336. But there are other factors, too?—All the other factors operate both on India and England.

2337. (*Professor Coyajee.*) What is the proportion of protected production in India to the general total production? What I mean to say is that there are two or three industries which are protected and for their sakes exchange should be kept artificially low —I am not justifying or criticising protection at all. Protection may be bad. I am not a protectionist. But that is what you consented to when you imposed it. The people knew when the tariff was being raised that general prices would rise, not merely the prices of imported goods. The prices of protected goods may rise to the full extent of 12½ or whatever the protection is; other prices may rise in a very minor degree, or it may be that imported articles may not rise to the full extent; there may be a dispersion of prices.

2338. The effect of protection is to restrict imports, the tendency is to produce a favourable balance, which will mean a general rise of prices and may operate in any direction?—Yes. I am only indicating the general tendencies.

2339. (*Sir Rajendranath Mookerjee.*) In addition to what Sir Henry Strakosch has explained about the difficulty of the difference between 1s. 6d. and 1s. 4d. being too wide, may I ask whether you are prepared to give to the Government a handle for again manipulating exchange, from which the country is alleged to have suffered so much. Would you give Government the same opportunity again?—You should entrust that power to somebody during the period of transition.

2340. You remember the criticism and the attitude of the Legislative Assembly in that connection in the past?—But a Committee of the Assembly will be even less satisfactory than the Government.

2341. (*Sir Maneckji Dadabhoy.*) I understood you to say that you give this power of deviation or discretion to Government to play between 1s. 4d. and 1s. 6d. to avoid violent fluctuations in exchange? Your object is to prevent violent fluctuations?—No, my object is only this. In view of the uncertainty of the trend of prices, we do not know as to what you will be able to do, and that if Government decides on fixing the exchange and gold prices fell, I suspect that the margin would be so wide that Government may not be able to manage it. Therefore Government should have discretion to adapt their policy to the changing circumstances that may arise in the near future.

2341A. Taking that as the basis of your argument, would it not be equally safe if Government fixed on 1s. 5d. instead of the deviation between 1s. 6d. and 1s. 4d.?—No, because under my scheme the Government would be bound to maintain a minimum of 1s. 4d.—not higher. The resources of Government for maintaining this are much higher in the eventuality of adverse circumstances.

2342. On account of the manipulation of tariffs?—I am not talking of tariffs at all. The power of maintaining a rate of 1s. 4d. is much greater than 1s. 6d. in the face of adverse circumstances because after all the resources of the Government are limited and so also power of the country to stand deflation. If this power is given to Government, it would not interfere with trade and ruin confidence. Rather it would restore confidence.

2343. So with a difference of two pence, still people would not hesitate to go in for large imports and the fact that the Finance Member would be manipulating dexterously in view of the changed circumstances?—The same confidence which is now reposed

in the Finance Member would also be reposed then. This is only an additional circumstance.

2344. You have stated that importers are discouraged because of the trade depression of the world? You cannot stop the general depression. What is the cause of general depression?—The cause is that the wages have not adjusted themselves to the altered circumstances.

2345. (*Sir Alexander Murray.*) Is this a suitable point at which to draw the attention of Mr. Chablani to the last sentence of the first paragraph on page 96 (Appendices), where he says "if owing to external causes beyond our control, this stability in internal prices does not give us stability of exchanges I would leave the exchanges to their own fate." What does he actually mean by that?

2345A. (*Chairman.*) Perhaps you would stick to prices and let exchange go its own way?—Yes.

2346. (*Sir Alexander Murray.*) Even agreeing that the volume of internal trade is larger than that of external trade, is the latter not large enough to justify an attempt to fix some rates of exchange?—May I explain what I mean by this? All that I mean is that we must stabilise the rupee in terms of gold—that we should have the same prices as gold prices. If, for instance, there are the fluctuations in the sterling prices in England, we ought not to change our internal prices. We should be independent of that. That is only in the event of sterling and gold not keeping company. The whole trend of my argument is that I am opposed to the linking of the value to the varying circumstances of exchange of any particular country. I rather would have it linked with gold so that we may have the same prices as the gold prices. Taking a simple fact, supposing France does not restore gold standard and we have fluctuations with the Paris Exchange, we need not care a twopence for it. We are not going to change internal prices to suit the Paris Exchange.

2347. You will link yourself to gold and not care what happens to the exchange?—Yes. So far as the gold standard is restored it will give us stability with gold exchanges, exchanges with the gold standard countries. But so far as the currency of those countries deviates from gold we should not change our policy of internal prices.

2348. But you must fix a ratio?—Yes, in terms of gold.

2349. And in the meantime that would remain somewhere between 1s. 4d. and 1s. 6d.?—During the period of transition.

2350. (*Chairman.*) Mr. Chablani wishes to have it at 1s. 4d. for the lower point and 1s. 6d. for the higher point, not somewhere between them?—Yes.

2351. (*Sir Purshotamdas Thakurdas.*) To the extent of fluctuations in gold prices in the world, of course the Indian prices are liable to fluctuations?—Certainly.

2352. (*Chairman.*) To do full justice to your views we should summarise them by calling attention to the fact that you are of opinion that, without taking the tariff into account, Indian prices have adjusted themselves to the present rate of 1s. 6d. That is an opinion expressed in your memorandum, I think?—Yes, at present.

2353. But you express a preference for 1s. 4d. as the lower rate?—Yes.

2354. And 1s. 6d. as the higher rate?—Yes.

2355. But you are not in favour of any positive action to reduce the exchange to 1s. 4d.?—No. There is one other fact which induces me to fix these limits. Suppose instead of a fall there is an actual rise of gold prices. Suppose that gold prices rise to such an extent as to maintain the required difference of price level between England and India and even go beyond, then, under those circumstances, 1s. 6d. might be the correct ratio.

2356. I am right in saying, am I not, that you do not recommend any positive action to reduce the rate to 1s. 4d. in the nature of increasing the currency?—Not till we know exactly where we stand so far as the world prices go.

2357. You leave that to natural forces?—Yes.

2358. Supposing that the policy is announced and that there is to be no intervention until the rate has fallen to 1s. 4d., do not you think it is possible that there might be speculative prices which would drive the rate straight down to 1s. 4d.?—Yes, it cannot go beyond that at any rate.

2359. You do not, I think, lay very much stress upon the injuries which might be inflicted upon the whole community by serious and violent fluctuations between 1s. 6d. and 1s. 4d.?—I think it is a restoration rather than injury because since 1922 the prices have been made to fall.

2360. Now, to continue, I want to emphasise your opinion on one or two leading matters. Are you in favour of the transfer of the control of the note issue, and the reserves upon which that issue is based, to the Imperial Bank?—Yes, under proper safeguards.

2361. Which I will ask you about in a moment. As a part of the method of transfer, are you in favour of a combination of the existing reserves into one reserve under the control of the bank?—Yes.

2362. I think it would be of interest if you could state very briefly your reasons in favour of the combination of the two reserves into a single reserve?—My main reason is that the rupee being practically a note printed on silver, in my scheme of the convertible rupee I want to ensure sufficient reserve for Government to give gold in return for rupees in India, just as Government will give rupees in return for notes in India. Just as we have convertibility of notes, we shall have a convertibility of rupees under my scheme.

2363. What form would that convertibility of the silver rupee take?—In return for silver rupees Government will give gold bars.

2364. To a minimum amount? What will be the size of a unit of gold bars?—That is a matter of detail. I am not prepared to say off-hand what limit there should be. It is rather a practical detail. In England for instance the limit is struck at about £1,700 or something of that sort—or 400 oz. So on account of the fact that the reserves would be in India and the rupee and the note are practically the same, one printed on silver and the other on paper, the policy regarding both ought to be the same, and it would simplify matters if both are combined. There is another thing. The present position of the paper currency reserve shows that practically the gold standard reserve has been used up because you have got the Treasury bills still backing the paper currency; amalgamation will only mean the cancellation of these.

2365. On what basis would you estimate the quantitative liability in respect of the silver rupee currency which you are undertaking on this system?—I would consider the maximum amount that will be required by India in the case of a famine or weakening of exchange in the light of past experience. I will have sufficient stocks of gold to make it possible to give gold in exchange of rupees in these cases.

2366. Shall we call it the maximum possible contractibility of the currency. That you would look upon as a true measure of the liability which you are undertaking?—Yes.

2367. Finally on this head, will you tell me why you lay special emphasis on maintaining, as regards the bank's method of presenting its accounts, separation between the issue department and the banking department?—Because I fear that the public confidence might be a little shaken if it is announced that the note is not the Government note but is in the hands of the bank. With a view to ensure that the paper currency is managed on the lines dictated by the Government the issue department shall be

distinct from the banking department and the reserve that will have to be maintained against the issue department should be very clear to the public. Not merely that; there is also another reason. At present the notes are really secured on the revenues of India. So the bank would practically be an agent on behalf of the Government in issuing notes rather than a note issuing department in a complete sense.

2368. Do you think that the method from the public point of view, shall I say from the point of view of the uninstructed but interested public, of representing the accounts of a central bank under the two headings provides in fact a more clear and intelligible picture of the position than the Continental method of combining the two departments?—I think in view of the lack of intelligence of the public it is absolutely necessary. I base it mostly on the psychological effect on the public mind.

2369. You do think then that it enables them to understand the position better?—At any rate it will enable them not to misunderstand the position if some people are interested in misrepresenting it.

2370. Oh, I see. What you really think is that it makes it more difficult for an ill-disposed bank to make the position obscure to the public, and that is no doubt an important consideration?—Yes.

2371. (*Sir Purshotamdas Thakurdas.*) When you give approval to the transfer to the Imperial Bank, whose notes should the Bank issue, the Bank's own notes or the Government notes?—In the beginning certainly Government notes.

2372. It would mean only that the Currency Department of the Government of India would be managed by the Imperial Bank?—By a bank rather than a Department of the Government.

2373. The bank would not be issuing their own notes at all and therefore the account will have to be separated in any case?—Yes.

2374. Do I take it that you are against the bank issuing its own paper?—I am, for the simple reason that it is a public function and all the profits should go to the public.

2375. If a scheme could be devised by which the profits could be allocated between the bank and the Government, would you agree to the paper being issued by the bank?—Still I would rather pay the bank as an agent of the Government rather than allow it to share the profit.

2376. You would rather the bank acted as the Government's agent?—Yes.

2377. You further mention that you would provide for more Government control of the bank. If the bank is to act as agent of the Government where does the control by the Government of the bank come in?—It comes in because as a matter of fact even now I am afraid Government has practically given certain privilege of a central bank—State bank—to the Imperial Bank, without exercising sufficient control.

2378. What view do you take; the balances of Government are kept free of interest; you call that a function exercised by the bank?—That yields profit.

2379. Is it for the work that the bank does for the Government?—But it is paid for its services.

2380. Do you think that as it is, the Government control on the Imperial Bank is much too little?—Too little to justify a further extention of functions.

2381. As it is, it is much too little?—Yes.

2382. And you think even if the Government were to hand over to the Imperial Bank the note issue as the Government's agent, the control should be further increased?—Yes.

2383. Can you indicate the directions in which control should be increased?—I have generally indicated them. I agree with Keynes' memorandum before the Chamberlain Committee.

2384. That is for a purely State Bank?—Well, what I feel is that the Imperial Bank should be transformed into a State Bank.

2385. Even though the paper to be issued is the Government of India's?—Yes.

2386. It is to be issued by the State Bank as the Government's agent?—Yes.

2387. Do you think the change necessary for this purpose?—Well, you see, it is only for the time being till the people get accustomed to seeing it is a State Bank and not merely a bank of shareholders. The reason why I want the two accounts to be separate is to inspire public confidence. If after some time public confidence is regained and the constitution of the bank is such that it is really practically a State Bank it will not be necessary to keep separate accounts. I do not rule out the possibility of the Continental practice coming in afterwards.

2388. But for the immediate future you think that even for acting as agents the control of the Government over the bank ought to be greater?—Yes.

2389. Not, I infer from what you have said, not because the transfer of the paper issue necessitates any control but because you are dissatisfied with the present control of the Government on the present work of the bank?—Because otherwise the Imperial Bank is not fulfilling the functions of a State Bank and Government will have to consider the possibility of starting a State Bank sooner or later.

2390. Yes, if you said the Government control should be more if the Imperial Bank were changed into a State Bank I could understand; but you think the present control is not adequate. Even if the bank is to be employed as an agent of the Government the control should be increased?—Well, this transfer of the note issue is another step forward in the direction of making it a State Bank.

2391. Even as agents of the Government?—Yes.

2392. (*Chairman.*) I have some little doubt as to what you mean by the State Bank issuing notes as agents of the Government. Do you mean that the State Bank should have no voice at all in the monetary policy of the note issues or in the use of the reserves?—No, it will have discretion.

2393. Or do you mean, on the other hand, that the Imperial Bank should really control the policy of the note issues and the use of reserves, that it should be able to call upon the Government for as many notes as it thinks right, the only thing being that the pattern of the note should be a State Bank note instead of a Government note?—I mean there should be more Government control on the Imperial Bank, within the Board of the Imperial Bank—the Governors, for instance. The Board of the Imperial Bank would have perfect discretion regarding notes and reserves, only the note will be issued by the State and the accounts kept separate.

2394. In return for further Government control you are prepared to put the bank into actual control of the note issue, only retaining out of consideration for popular prejudices that the pattern of the note shall express it to be a Government note?—Not only this will satisfy popular prejudices but if the Issue Department's accounts are kept separate there is a certain amount of publicity.

2395. (*Sir Henry Strakosch.*) With regard to the question of reserves. You agreed that the size of the foreign currency and gold reserves has to be measured by the contraction of currency that would be possible without undue damage to the country. At what amount do you estimate that?—No, that is not the only point. The size of the reserve is also to be determined by the possibility of a panic in India when rupees and notes might be returned to Government and gold asked for.

2396. But there is a point beyond which you cannot contract the currency without grave injury to the country, a point where it would pay you better to allow the exchange to go rather than contract further.—But the contraction under my scheme will not be in the hands of Government. It will be in the hands of the public. If there is a panic the amount of contraction which will be made does not rest with any authority.

2397. But is there not a point beyond which contraction cannot go even if it is in the hands of the public?—Yes.

2398. I should like to know what in your view that point is; expressing it perhaps in a percentage of the total circulation, to what extent do you think one can contract currency?—I am afraid I cannot give you any details because in the first place one does not know how far this authority, this power of exchanging rupees for gold would actually be availed of. Probably in the beginning the reserve needed will be larger than afterwards because till people get accustomed to the idea that they can get gold in exchange for notes or rupees the possibility of a great rush on the Government or the bank to give gold for rupees and notes has to be taken into account.

2399. You cannot tell us what the amount should be?—I cannot.

2400. Now there is another question. Under the present system and under any gold exchange or sterling exchange system, India would have two kinds of token coins in circulation. You very aptly described them as notes printed one on silver and one on paper, the only distinguishing feature between the two classes of token being that one is printed on a more valuable material than the other; otherwise there is no difference. They are inconvertible internally and their foreign exchange value is secured by a foreign currency reserve?—They are now inconvertible internally but would be convertible under my scheme.

2401. Convertible into exportable gold?—Even gold that you use for ornament purposes.

2402. You intend to give gold internally?—Yes.

2403. Gold bars?—Yes.

2404. But not gold coin?—Yes.

2405. You would give gold for either rupee notes or rupee coin?—It comes to the same thing ultimately.

2406. Quite; my point is this. Is it necessary that one token should be convertible into the other token, my point being is it necessary to make the rupee note convertible into rupee coin?—For some time till people get accustomed; afterwards it may not be necessary to mint rupees at all.

2407. What I mean is this. The two tokens being for internal purposes absolutely equal what is the reason why the one token should be convertible into the other token?—Because of their relative popularity among different classes of people in different parts of the country.

2408. If you maintained the full legal tender right of the rupee coin, what would you say if the convertibility were taken away, because both are convertible into gold under your system. Is it therefore necessary to convert the note into rupee coin?—Yes, because in certain areas it is the rupee that will be wanted for circulation and gold will not circulate because I am giving only gold bars. Supposing in certain areas rupees are wanted for circulation, then the notes will be converted into rupees, notes not being popular.

2409.—But notes won't get there. If that area wants rupees the rupees will flow to that area and the notes will flow to the areas which want notes?—Still there must be facilities for converting one into the other.

2410. You regard it as necessary?—Yes, for some time.

2411. What will happen otherwise?—People will imagine all sorts of things; in the public mind there will be a good deal of misapprehension. People will think that Government is issuing notes which cannot be turned into metal when they want it.

2412. Would that be such a bad feature? Let us take the most extreme case, that people will become distrustful and they will begin hoarding rupee coin?—They will not hoard rupee coin, but gold. The demand for gold will be much greater.

2413. But gold is not a circulating medium?—Quite true, so there will be a scarcity of currency in the country.

2414. It might be supplied either by notes or rupee coins?—But for the time being it creates a great deal of misapprehension. Till people get used to the idea that they can have gold any time they want it, that the rupee and the note are quite the same, merely tokens for exchange into gold at any time they like. Habit is strong, the rupee has been in use for a long time and people have got used to the rupee.

2415. You will agree that the system at present in force here of one token being exchanged against another is a cumbersome one and an expensive one?—Yes.

2416. Because you have to keep very big reserves of rupee coin. And you would regard it as desirable that that should be at some time or another abolished?—Yes, eventually.

2417. And when do you think that could be done?—Well, we cannot say at present. It all depends upon banking facilities being extended in India. It also depends on the confidence that the currency policy of Government inspires and the education of the masses. All these are uncertain factors.

2418. Would not the fact that the Indian public would get a right which they never possessed before, namely, to demand gold for rupees, be sufficient to make them realise that the rupee coin and the rupee note are the same thing really?—Well it takes time for ignorant people to realise a thing like that.

2419. (*Sir Maneckji Dadabhoy.*) May I ask you one question in connection with the questions put by Sir Purshotamdas Thakurdas about the Imperial Bank? You said in answer to Sir Purshotamdas that you would like to see Government exercising greater control over the Imperial Bank. Will you just enumerate the instances in which you would like that control to be exercised?—On the management of the Governing Board there should be more Government nominees. For instance, Keynes suggested the Governor to be nominated by His Majesty the King; even the representative of the Government to be nominated by the Viceroy, and the Deputy Governor to be nominated by the Viceroy on the recommendation of the Governor. A Board of three is the authority under his scheme.

2420. Is there any other direction in which greater power could be exercised?—That practically does everything. No details are required when the whole management is in your hands.

2421. (*Sir Purshotamdas Thakurdas.*) Are you aware that the two managing Governors are nominated by the Viceroy?—But out of how many?

2422. There are two at present and both are nominated by the Viceroy; therefore it is practically what you want?—Excuse me, there is a good deal of difference between the two schemes.

2423. (*Sir Purshotamdas Thakurdas.*) I was only referring to what you mentioned specifically in reply to Sir Maneckji's question. Well, we will drop the matter. You have your views on record.

2424. (*Sir Henry Strakosch.*) With regard to the control of the currency of the future, your ideal would be a State Bank and you agree with Mr. Keynes' proposals in 1914 advocating a State Bank. You are no doubt aware that a rather drastic evolution of thought has occurred since 1914, and that both the Brussels and Genoa Conferences have affirmed that the most desirable system of currency control is through a private Central Bank free from all political control?—Yes.

2425. And the events since 1918 have, I think, given very convincing demonstration how desirable it is that a Central Bank should not be controlled by Government. Would you nevertheless say that in India the Currency should be controlled by a State Bank under the control of Government?—All that the recent experience has shown is that a Central State Bank should not be absolutely at the mercy of political forces. The shareholders also should have a share in the control. The point of my argument only is that when certain public functions are expected to be performed by a State Bank

the degree of control ought to be greater than exists at present.

2426. But Brussels and Genoa recommended that the Central Bank managing the currency should be entirely free from Government or political control?—There is a difference between the countries with which the Brussels conference dealt and India because of the vital difference that in other countries a private Bank takes charge of the interests of the nation. It has not on it the representatives of foreign capitalists nor is it under the management of foreigners. In India Government is the only agency through which the interests of the country are likely to be urged and so there must be greater control by the Government.

2427. You don't think that India is capable without Government control to manage its own affairs soundly?—Our own affairs are not in our hands. To a great degree they are in other people's hands.

2428. What do you mean by other people's hands?—Even in the Imperial Bank the control is mostly European and the only way in which the interests of the country could be placed before the interests of the Board is to have effective Government control.

2429. Oh, I see. But the Government is also partly European?—Partly it is no doubt but we hope it will become more and more Indian; at any rate an agitation can be started against the Government.

2430. That is the only reason why you think it should be a State Bank and not a private institution? Even when Governments are national, the Government could bungle at times?—On the whole a national Government will control the work of a State Bank far more in the interests of the people.

2431. Has that been the experience of recent years?—Governments went mad in time of war. That is hardly a normal experience. The Governments were as a matter of fact compelled in the interests of war to put pressure upon State Banks.

2432. But the greatest amount of mischief was done not during but after the war?—But "after the war" does not exclude the effects of war; "after the war" means also the period in which people were trying to make up for the wastage of war. That is not a normal period to take into account. In time of war you might declare that a Bank is closed. You might declare a moratorium.

2433. But you have no doubt heard that some Governments expending more money for public purposes than they can really afford and that they would not mind a bit of inflation to do it?—But that stage is not likely to arrive in India; the democratic force is not going to be so strong in India in the near future.

2434. (*Chairman*.) I understand the conclusion at which you arrive from Sir Henry Strakosch's questions is that the introduction of the system which you advocate, under which gold bars would be given freely against notes or rupees, would enable you, after the lapse of a period which you cannot define for the establishment of complete confidence in the convertibility of the rupee and the rupee note into gold, to abolish the privilege of converting the note into the silver rupee. It would be a system which would naturally lead to that consequence?—Yes.

2435. Supposing it were desirable that at some time the right of unlimited legal tender attached to the rupee should also cease, would your system also lead eventually to a state of affairs in which that would be possible?—Yes.

2436. In fact one might look upon the attainment of those two objects as probably arriving at about the same time, that is, the non-convertibility of the note into the silver rupee and the limited legal tender of the rupee?—Probably.

2437. I understand you to express an opinion throughout your memorandum adverse to the introduction of a gold circulation; that is, indeed, the basis of your views?—Yes.

2438. I want to ask you if you will deal just quite briefly with one or two of the principal contentions that have been advanced in favour of a gold circulation. I think I can conveniently do so by picking out a few points from the Report of the Royal Commission of 1914; they are given in a list at page 16. I need not trouble you with them all but only with one or two of the most important. What is your view as to the contention that a gold currency is a necessary step towards what may be regarded as the ideal currency in which paper is backed by gold in reserve? Do you consider that that is a necessary step towards such an ideal currency?—No, I do not.

2439. Do you think that it would advance the time when such an ideal currency would be introduced?—I don't think so.

2440. Are you basing your opinion upon the rather obvious suggestion that people who are once used to a gold currency are often very loth to part with it in favour of any less substantial medium?—Yes. That danger is particularly great in India.

2441. What makes you say that?—Because of the fondness of the people for precious metals.

2442. That is evidenced by the unaltered habits of the people throughout the centuries?—Yes.

2443. The only other argument here of sufficient importance for me to trouble you with is "that a large amount of gold in circulation is a strong, and, in the view of some people, the only adequate support for exchange." Do you attach any importance to that contention?—As against the present system; but not against the system that I advocate.

2444. You would rather have gold in circulation than no gold available at all?—Yes.

2445. You would not rather have it than a central gold reserve?—No.

2446. I understand you are inclined to agree that only a very small percentage of gold in active circulation can be looked upon as available as a reserve for use in times of pressure?—Yes.

2447. (*Sir Purshotamdas Thakurdas*.) I take it I can ask his opinion regarding notes of lower denomination than ten rupees later on.

2448. (*Chairman*.) It escaped my memory. Let us ask Mr. Chablani now. What is your opinion as to the advisability or the reverse of a policy of issuing notes of lower denomination than Rs. 5?—I am against it for the simple reason that a small note is practically inconvertible.

2449. I remember that phrase in your memorandum which caused me some difficulty at the time. What is the reason for the practical inconvertibility of the small note?—Supposing I have got a few rupees in my pocket I will not take the trouble of going and getting it encashed. That is the difficulty. The small notes get into circulation and people do not like to take the trouble of going to the Treasury or Bank and getting them encashed.

2450. They could encash it if they wanted to?—They could; but with a small note of say a rupee you don't take the necessary trouble to get it encashed.

2451. Why should anybody mind that? It is not a desirable thing for people to encash their notes?—Take a place far remote from a railway station. If more notes are put into circulation than are needed by the public for the purpose of transactions they would not be presented to the Government Treasury offices for encashment because of the difficulty of going to the next Currency office or even to a Post Office. That same complaint occurred in Scotland. The point was argued in 1765, if I mistake not. I find a reference made to that point in Nicholson's Principles, volume 2 and also in Nicholson's War Finance; that is the main reason why in most countries you find that in relation to token coins the denomination of notes is large.

2452. I am afraid I have not grasped the point yet. What is the point put in Mr. Nicholson's book, for instance?—He refers to the Act of 1765 as marking the recognition in Scotland of two great principles for the regulation of note issue, one of which is "that if notes are small there may be an excess of issues

in spite of the fact that they are nominally convertible."

2453. "There may be an excess of issues"?—Yes.

2454. What does that mean?—Supposing Government puts more issues, prints more notes than you require, the ordinary effect would be a tendency to a rise of prices; general convertibility is the only safeguard; but if you have these small notes you prevent them from being encashed.

2455. I understand you really look at it from the point of view of the danger of inflation, that relying on the difficulty of return of the small note, the Government might be tempted to make an over-issue. Is not this adequately checked by the provisions as to the reserve?—No.

2456. Why is that not so?—Because Government's reserve policy is only to provide a sufficient reserve for encashing notes which they expect would be presented to them. Government could safely rely upon such notes not being presented to them.

2457. (*Chairman.*) I appreciate your argument and I recognise it in its present form. Are there any supplementary questions on this point?

2458. (*Sir Purshotamdas Thakurdas.*) You mention that you are not in favour of issuing notes of lower denominations than Rs. 10?—Yes.

2459. Would you discontinue five rupee notes?—Yes.

2460. That means up to ten rupees you would say that the people must carry their money in coin?—Yes.

2461. Is not the five rupee note sufficiently popular to make it very difficult for Government to discontinue it?—It is not a question of popularity; it is a question of adequate safeguard against the possibility of issuing in excess of public requirements. That could only be safeguarded by making convertibility easy.

2462. Do you think you could urge that against the five rupee note? I could understand it in the case of the one rupee note.—To a much less degree perhaps in the case of the five rupee note than the one rupee note.

2463. More especially your opinion is concentrated against the one rupee note being started again than against the five rupee note?—Yes.

2464. Regarding gold currency, the argument that you put forward in your reply would not appeal to the masses?—Nothing would appeal to the masses more than the possibility of getting gold from Government easily.

2465. If there is going to be a change, do you not think there is more liklihood of the gold coin being understood by the masses better?—No.

2466. (*Chairman.*) Mr. Chablani is now referring to his answers relating to his proposal for giving gold in bars.

2467. (*Sir Purshotamdas Thakurdas.*) I was referring to the coin? How will the gold bar be appreciated or nnderstood by the smaller man in the mofussil districts?—Because the smaller bullion dealer will get bars and give him gold more easily.

2468. Is there at present any difficulty in getting bars?—The smaller dealer does not deal with the Government and return notes or rupees for gold.

2469. It is through the smaller dealer that you expect the people to appreciate that gold has come from the Government Treasury and not from the wholesale dealer in Calcutta or Bombay?—Yes, but I am not arguing this point as the sole or major reason for the step I propose.

2470. I am trying to find out from you whether gold coin if it was issued would not be better appreciated by the masses?—It would have the same effect so far as masses are concerned. I do not admit it will have greater effect.

2471. Which; the coin?—Yes, it will not have greater effect.

2472. The bullion which is available to the middleman would not be available?—Most of the statistics seem to show that the sovereigns issued before the war were really required for the purposes of hoarding or ornaments for which purposes the gold bar is equally useful.

2473. You mean the coins were never used as coins?—Not never, but less used as coins.

2474. And therefore as long as gold is available, it does not matter?—Yes.

2475. For that purpose supposing Government did not give gold for internal circulation and gold import was freely allowed, would it serve the same purpose?—It would not serve the same purpose from the point of view of our currency system.

2476. Therefore, apart from the currency system point of view as far as the masses are concerned, there is no difference to them whether the Government gives gold or gold is available by private import?—But the masses are concerned in the rise and fall of the prices. They are concerned in the stability of the purchasing power of money.

2477. I have no doubt about that. What I say is that this scheme which you advocate will not make any difference to the masses as far as the currency system is concerned.—It does make a difference because in this case currency is withdrawable. Rupees can be withdrawn from circulation internally.

2478. It will not be in this case?—When the public gives rupees to Government and gets gold, rupees are withdrawn from circulation; there is automatic process of contraction.

2479. The same would happen if the coin was there instead of bullion.—How will that contract the currency? How can currency be contracted by the sovereign if it remains in circulation?

2480. Currency can be contracted when the people return it to the Treasury as in the case of your gold bullion?—When they get in return the gold coin?

2481. It is a question now of gold coin or gold bullion. You advocate that Government should give out not gold coin but gold bullion. I am only trying to look at it from the point of view of which of the two would appeal better to the masses. You say either would appeal to the masses because the masses will realise that they get the gold bullion from the Government treasury; it does not matter to the masses at all whether they get it from a Government Treasury or the wholesale dealer in Calcutta or Bombay; as far as the public benefit, from the sentimental point of view, is concerned it is bound to appeal less to the public?—I do not say it would appeal less; I would put it on the same footing.

2482. Even though you admit that the public would not go and fetch the gold—I mean when I say public the small man—from the Government Treasury? You said in reply I think to a question that you would have to fix a certain limit. You could not buy one tola from the Government Treasury. You would have to fix a fairly high limit. I think you mentioned something like 1,500 rupees?—I left it as matter of detail. I understood in England it was 400 ounces.

2483. What would you allow as the safe minimum?—It is a matter of detail.

2484. It would have to be in multiples of rupees 100?—Of course.

2485. Do you think a large number of people would go and get this bullion?—You will have to create the machinery.

2486. Therefore it will have to be through an intermediary?—Of course.

2487. Instead of as at present?—The facilities offered by Government will be greater than what the trade provides at the present moment.

2488. You realise that this scheme practically means control of the gold bullion in the hands of Government?—I would not put it like that.

2489. When Government import gold and give it out at a certain rate?—It rather means control by gold of the currency.

2490. And practically no trade in import of gold by any private agency?—Why, look at what is happening in England.

2491. I am not questioning whether it is right or wrong, I am only mentioning it as a possible point of view?—What I submit is that you are looking at the wrong end. It will rather be control by gold of the amount of currency.

2492. There are large private importers of bullion at present?—They will continue.

2493. Will they?—Yes.

2494. Even though you can get gold from the Government at a fixed rate?—But the Government will buy from them.

2495. (*Sir Henry Strakosch.*) Is that likely?—Why not? The dealer in India will no doubt want to make the profit which Government might easily make by importing gold themselves?—Of course the dealer will have to go down to that level: when Government imports it pays something.

2496. How then will it contract currency?—The contraction will be only when the public present rupees to Government and get gold from Government.

2497. But previous to that when the Government has bought gold in India it will have paid rupees?—What happens is this. Expansion of currency would be by Government purchasing and the contraction of currency would be by Government selling gold in return for rupees.

2498. One cancels out the other?—Of course that is what is wanted. We want an automatic process of contraction and expansion.

2499. So that the Government would only buy gold in India when it wants to expand currency and it is at the mercy of the people so far as the contraction is concerned?—Supposing people demand gold from Government, Government will have to buy again from some people. The two processes continue and sometimes cancel out. Ordinarily the two may cancel out. When expanding currency Government will buy more gold and give rupees: in times of contraction Government will sell more gold and receive rupees.

2500. But it is true that the power of Government to influence the volume of currency is only in the direction of expanding and not contracting. Therefore it is at the mercy of the popular demand for gold?—Yes. The popular demand would always be there, when gold appreciates relatively to the currency then people will go to Government and get in a cheaper way gold from Government.

2501. (*Chairman.*) Gold is part of the Government's or the Bank's reserves. Supposing there is a period of great anxiety and all the holders of silver hoards feel that they would rather have their hoards in gold, what is going to happen to the currency system then?—I quite see that there is a possibility, but such possibilities do arise everywhere.

2502. To make your system absolutely certain to work in a practical world, have you not got to confine the gold given out against rupees and notes to gold for the purposes of export only?—No; for the simple reason that we do not want to leave the value of currency at the mercy of Government. Supposing Government issues more than what is needed in the busy season and afterwards currency requires to be withdrawn, how will there be any withdrawal?

2503. If there is a fixed percentage for the reserve and the gold is withdrawn from the reserve for export, then the currency must automatically be contracted?—Gold will be required for export only in times of weak exchange and there may be occasions when the exchange is all right and yet the country may not require so much currency.

2504. You are not impressed by the danger of, say, silver hoards being tendered for gold?—I am not impressed, but the danger will be greater, the greater the nervousness. The only way to meet that is to be bold. It will be difficult for any Government to meet the demands for encashment of all notes, if people get mad and make a rush. The only right policy in times of panic is the policy always adopted of paying out freely.

2505. It occurs to me that here you will be rendering your system liable to a danger which might materialise in something very much less than a panic but simply an appreciation on the part of the holders of silver hoards that there was an opportunity open to them?—If there is a great demand for gold, the rupee will be withdrawn from circulation and since the rupee and the notes are the only circulation in the country, that will create a scarcity of the currency, and very soon, there will be a further demand for currency as soon as gold does not circulate. What circulates is only notes and rupees.

2506. I am considering a currency circulation that is really quite unchanged. It appears to me not an impossible eventuality that, in perfectly normal times when trade is running quite easily, the holders of big hoards might suddenly awaken to the fact that they can get gold for their silver if they want it?—I should rather think that, once it is understood that gold can be had at any time it is wanted by the public, people will make no such heavy demand.

2507. I should imagine that once they had gone round and got the gold, the mischief might be done?—I say we must accumulate sufficient gold for the purpose of meeting this; that I have already said; in the period of transition with exchange between 1s. 6d. and 1s. 4d. Government has a nice opportunity for accumulating gold.

2508. You would not contemplate embarking upon an undertaking to give gold bars against rupees and rupee notes without taking whatever precautions were necessary as regards the establishment of an adequate reserve against that purpose?—Certainly. The time will have to be left to the Government. You must leave it to the Executive.

2509. (*Sir Alexander Murray.*) You deal with the question of expansion in the second last paragraph on page 98 of the Volume of Appendices. Do you mean the Commission to infer from your statement there that currency should only be expanded in accordance with the growth of trade over a year and not seasonal expansion?—If there is seasonal expansion there should be seasonal contraction too.

2510. You do not mean that Government should only expand the currency based on a percentage of say the preceding year's circulation?—No, I do not mean that at all. All that I mean is under the present system while you have an expansion seasonally, when there is a slack season there is no automatic process of contraction; so that, once the currency is thrown into circulation it remains there. That is the defect of the system.

2511. How do you propose to overcome it?—The convertible rupee; as soon as the slack season goes and people want gold, it will be presented to Government and gold bars taken for ornaments or trade, and deflation effected.

2512. Expansion will take place during the busy season?—And in the slack season that will be a return.

2513. If people want gold?—Yes.

2514. Not if they don't want it?—But they *will* want gold if there is too much currency for the slack season, for then the currency will depreciate in terms of gold, and people will find it more profitable to ask for gold from Government at a particular price.

2515. (*Chairman.*) We have had very full assistance from you, Mr. Chablani, for which, on behalf of the Commission, I thank you.

(*The witness withdrew.*)

EIGHT DAY.

Thursday, December 3rd, 1925.

PRESENT :

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

SIR RAJENDRANATH MOOKERJEE, K.C.I.E, K.C.V.O.
SIR NORCOT HASTINGS YEELES WARREN, K.C.I.E.
SIR REGINALD MANT, K.C.I.E., C.S.I.
SIR MANECKJI BYRAMJI DADABHOY, K.C.I.E.
SIR HENRY STRAKOSCH, K.B.E.
SIR ALEXANDER ROBERTSON MURRAY, C.B.E.
SIR PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
PROFESSOR JAHANGIR COOVERJEE COYAJEE.
MR. WILLIAM EDWARD PRESTON.

MR. A. V. V. AIYAR, C.I.E. } (*Secretaries*).
MR. G. H. BAXTER }

Mr. B. G. BHATNAGAR, called and examined.

2516. (*Chairman.*) Mr. Bhatnagar, you are engaged in the Economics Department of the University of Allahabad?—Yes, Sir.

2517. Since when, may I ask, have you been there?—Since 1918-19.

2518. And before that?—I was a scholar in the year 1918-19 after finishing my studies. My teaching career began in 1920.

2519. You have furnished us with a very full memorandum,* which the Commission has read with interest, and I will, if I may, ask you a few questions in order to bring out those points on which you lay particular emphasis and to elucidate any matters which still seem to require elucidation. You refer to the unchangeable habits and strength of prejudice in currency matters of the uneducated population of India. There is also, is there not, a special public on currency matters, small but highly instructed, in the substantial number of small bullion brokers, money brokers, and others engaged in small bullion and monetary transactions?—Yes.

2520. And this, I imagine, is a very alert class, is it not?—In India we find it mostly in big cities, especially in Bombay and Calcutta.

2521. But that class is very rapidly alive to any changes and possibilities in the currency situation?—Of course, it must be.

2522. So that, although the general population may not be well instructed, yet any openings which there are for taking advantage of features of a currency system are likely to be rapidly communicated to the public by the brokers and others who may profit by them?—Yes, it is true that the information is likely to be carried to the public but it may not be exactly in the same form as may be beneficial for the public. The main object of the broker will be to take as much advantage as possible out of any change that may be introduced in the currency. What I mean here is this that the broker class is not likely to look at the question from the point of view of the advantage of the general public.

2523. On the other hand, I understand it is your opinion that there are certain habits as regards currency which are so inveterate in the uneducated Indian public as to be almost unchangeable except by a very slow process of education?—Yes, that is my belief. It is not only true, I think, of India, but we find it in other countries as well.

2524. And of those habits, you mention in particular the taste for gold and the reliance upon the silver rupee?—As far as I remember I mention two different and definite things—the taste for gold for ornamental purposes and a preference for the rupee for currency purposes.

* Appendix 14.

2525. In order to bring our discussion to a point, will you tell me a matter upon which your memorandum leaves me in some little doubt, viz., what do you consider to be the ideal system of currency for India? I do not mean an ideal if we were starting with a clean slate, as you say in your memorandum but the ideal system in the sense of the best system to which we ought to work?—Our future ideal, please, or the thing that may be possible to-day?

2526. No, the ultimate object which we ought to set before ourselves?—As I have already pointed out in the memorandum, our future ideal should be a gold standard, but gold not in active circulation—paper money in active circulation, convertible into gold, and this brought about not by any legal compulsion but by a change in the habits of the people and the development of banking and investing habits in the people. That is what has come to be the practice in England and other advanced countries.

2527. Under that system would gold still be available against notes for internal circulation?—Yes.

2528. Or would it have ceased to be so?—It will be available. It will not be forbidden by law, but because people will have realised the advantages of paper currency and the use of credit they will naturally take as little of it as possible.

2529. Under those circumstances I imagine you would say that it was almost a matter of indifference as to whether it was made no longer legally available or whether it was left legally available?—If the law were to lay down that gold would not be legally available, then it will have a psychological effect upon people and that will create a desire in their minds to have it.

2530. But we are assuming that the public have already learned to trust and use the note and not to require gold for circulation?—What I wish to emphasise is this, that the moment the law says that gold will not be available, that very fact may create an idea in the minds of people to ask for gold, although under ordinary circumstances they may not care to have it.

2531. Is that the experience of other countries which have worked to an exchange standard, that it is necessary to make gold still in form available for internal use, or have not other countries found that that is unnecessary when the public is once used to some form of paper circulation?—May I know one thing here? By saying that gold will not be available for the paper currency, am I to understand that paper becomes inconvertible?

2532. Except in some form of foreign exchange, either gold for export or foreign currencies?—So far as internal circulation is concerned, we may take it as inconvertible paper money? Personally, I do not know of any country where the system has been tried—paper unconvertible for internal circulation.

2533. Then you would not be prepared to express any opinion as to what the experience of other countries has been?—No, I am sorry I couldn't.

2534. We have taken what you consider to be the practical ideal. Now will you tell us by what steps you would work towards that ideal?—I have indicated also in the memorandum that first of all I would have the gold exchange standard back for some time, as we had it before the War. And if we have gold enough to make our paper currency convertible into gold and to have a 50 per cent. reserve in gold, I would do it immediately.

2535. Then you would do what immediately?—I would make paper currency convertible into gold immediately. But because we have not sufficient gold at this time I would again adopt the gold exchange standard and try to build up the gold reserve up to that point where we may be able to make our paper currency convertible into gold. When that was done, then I would declare rupees to be subsidiary coin.

2536. We may take your answer just as far as that on the two main steps: Your first step would be the restoration of the gold exchange standard as it was before the War?—Yes, provided I am correct in my calculation that gold is not sufficient to make the paper currency convertible just at present.

2537. What do you mean by that precisely? That would mean in practice the restoration not so much of the gold exchange standard as the sterling exchange standard, would it not, if we are to restore the pre-war system?—We may have a modification up to that extent; instead of having a sterling exchange standard, I would rather go in for gold.

2538. There would be certain modifications then, one of which would be the establishment of a gold exchange standard instead of sterling?—I think that was recommended by the Babington-Smith Committee also.

2539. Will you tell us why you prefer the gold exchange standard to the sterling exchange standard?—I recognise the fact that India has a very large trade with the British Isles, and that perhaps is one of the main reasons why generally it is preferred to have a sterling exchange standard instead of a gold exchange standard. That is one of the reasons generally given. But gold being an international currency, as they call it, I would rather have a gold exchange standard.

2540. And there will be no difficulty in exchange between England and India?—Yes, because sterling is now touching par with gold.

2541. What methods would you adopt, in particular as regards the constitution of the reserve and the nature of the securities and gold to be held in reserve, in order to establish the fact that yours was a gold exchange standard and not a sterling exchange standard?—Am I to answer this question with reference to the gold standard reserve or the paper currency reserve?

2542. We will consider it as regards the gold standard reserve?—At present we have practically the whole of the reserve in the securities of the British Isles. I cannot be definite about that statement, but this much I am certain that practically the whole of it is in the form of securities. I have no objection to having the gold standard reserve in the form of securities largely, but what I would insist upon is that the management, the selection of the securities should be left with the Government of India.

2543. The investment business should be done by the Government of India?—Yes.

2544. Instead of by the Secretary of State or on his behalf?—Yes.

2545. That would be one alteration. Do you propose that any part of your exchange standard reserve should be held in securities other than sterling?—We may divide it according to the share of the trade with India of different countries. That seems to be the only practical basis on which you can have it.

2546. Would you divide it in accordance with the actual share of the material trade done with the various countries, or would you divide it in accordance with the proportion of India's trade settled in the currencies of those countries?—First of all I would go in for the best securities that are easily realisable. That would be my main idea.

2547. Let me make my question clear to you. Although a substantial portion of India's trade is done directly with the United Kingdom, a very much bigger part of it is settled in sterling, as much as 90 per cent. Would not you consider that the proportion in which India's trade is settled in the currencies of various countries is that which should be taken into account in considering where you should hold your reserve?—That is an argument in favour of holding our reserve largely in sterling securities, but that presupposes that London will continue to be the clearing house and there is not much chance of London leaving that position.

2548. Would the securities which you hold in other countries, say in dollars or in guilders and so on, be of any practical utility in supporting the exchanges, or would they only be a theoretical factor in the gold exchange standard?—We might have some securities in the United States of America.

2549. What use would you make of them?—To sell them as in the case of other securities when we require gold.

2550. Would you not, as soon as you sold them, convert the proceeds into sterling?—Yes, because we have to make our payments in sterling.

2551. In that way you are settling your balance of trade?—Looked at from that point of view, it seems to me that we should have the greater part of our securities in sterling securities.

2552. Now as to gold, what provision would you make as to the right to obtain gold against internal currencies under the first step of a gold exchange standard?—That is when we have made our notes convertible into gold.

2553. Notes would be convertible into gold?—Yes.

2554. For any purpose freely?—Yes.

2555. And rupees?—The moment we have made our notes convertible in gold the rupee will have to acquire the position of a subsidiary coin.

2556. Would you immediately, upon the introduction of the gold exchange standard, make the rupee a subsidiary coin?—Not immediately on the introduction.

2557. At the first stage, what would your provision be as regards the obtaining of gold for rupees?—Just as we had before the war, only for meeting foreign liabilities.

2558. Before the war I understand the only provision as to giving gold against rupees was that the Government might do it if it liked. Would you make it a legal obligation?—Yes.

2559. But only, as you tell us, for foreign export?—Yes.

2560. What provision would be enforced in order to ensure that the gold was exported? Would that be a matter of difficulty?—In the past we generally used to allow gold when anybody wanted not more than £5,000 or £10,000.

2561. Some minimum amount, shall we say, of bars of bullion only?—Yes.

2562. Would you suggest that the minimum amount should be either in currency or in bullion bars or in bullion only?—I think it will come to the same thing.

2563. You will not give it altogether in sovereigns or in any other form of gold currency?—If we have a part of the reserve in that form we might do it.

2564. You think it would be an adequate insurance that the gold was only taken for export and that only a minimum amount should be given?—I do not mean to say that a minimum amount should be given and not more than that.

2565. Not less than that?—Not less than that should be given because people for internal purposes require small quantities of gold.

2566. We understand your object is that this gold should be given for export only?—Yes.

2567. The next question is, do you think that it would be an adequate insurance that the gold was taken for export only if the only provision to that end was that not less than a certain amount, say £2,000 worth of gold, were given against notes or rupees?—It would not be sufficient. People might take that for internal circulation.

2568. That might result, might it not, in people taking gold to substitute for silver in hoards?—Yes.

2569. So that you would require some active provision to ensure that the gold was exported and not sent into internal circulation?—Yes.

2570. That is the first step towards the restoration of a reformed pre-war system?—Yes.

2571. It is said that one of the defects of the pre-war system was that there was no provision for the automatic contraction of the currency in a bad year when exchange was falling. Do you agree that that was a defect of the pre-war system?—I think it was.

2572. How do you propose to remedy that?—So long as we have the gold exchange standard system, it will not be possible to remedy it completely, but when we have got the other system where gold will be introduced into active circulation, then it will have adjusted itself.

2573. To follow out that question, have you considered the possibility of the transfer of the control of the note issue and of the paper currency reserve consequentially from the Government to the Imperial Bank of India?—But I think the Imperial Bank will be acting as the agent of the Government.

2574. I want your views. There are two possibilities under the proposal. One is that the note issue might be transferred to the Imperial Bank only as managers for the Government; the other is that the note issue and the reserves against the note issue might be transferred to the Imperial Bank of India to control, just in the same way as the note issue and its reserves are controlled by the central bank of issue in many other countries, not as agents but as principals. Will you tell me what your opinion is as to the relative merits of these proposals, or the third alternative of leaving things as they are?—I am in favour of the first proposal of utilising the Imperial Bank as agent; and my reason for that is that if we make the Imperial Bank the principal, then, although with the Government having some control over the general policy of the Bank, yet it has got a large number of shareholders, and it does not seem to be desirable to entrust the whole management of the currency reserves and the management of the note issue to it. If it were to act as agent only, then it will be doing things under the direct supervision and according to the directions of the Government.

2575. Under that arrangement, the reserves, as I understand it, would remain under the direct control of the Government of India?—Yes, of the Government of India.

2576. It may be said that there is an advantage in combining the control of the banking reserves of the country and the currency and exchange reserves of the country in one hand in order to support and facilitate the operations of the money market in the country, and that is an argument in favour of the transfer of control to the bank of issue. What is your opinion upon that?—Could we not secure the same end simply by transferring the management and keeping the control in the hands of the Government of India?

2577. Could it be said that you would secure that end as long as the policy for the control of the banking reserves, on the one hand, and the paper and currency exchange reserves on the other hand, were not in the same hands?—If the active management is passed to the bank, the bank could bring its influence on the Government of India. Suppose at a particular moment the bank finds it necessary to have a larger issue of notes. Then if the management of the paper currency is in the hands of the bank it will have a very large influence with the Government of India, and the Government of India will allow the bank just at that moment to issue a larger number of notes, and in that way the bank will be in a position to meet the demands of the public.

2578. If the reserves are maintained still under the control of the Government, what is your opinion upon the advisability or otherwise of combining the paper currency reserve and the exchange reserve into a single reserve?—That will clash with the system that I am recommending.

2579. How so?—In practice, in the past, we have been utilising the gold in the two reserves for meeting adverse balances—the demand for reverse councils. But if we are to mix them up now, then we will never be able to know when we had sufficient gold for making our paper currency convertible.

2580. Do not the resources of each of the reserves at the present time serve a double purpose, the resources of the exchange reserve serving the purpose of maintaining the internal convertibility of the note currency to some extent, and the resources of the paper currency reserve serving the purpose of supporting the external value of the Indian currency to some extent?—Yes. Gold in the paper currency reserve has been used and has served as a background to tho gold standard reserve. But I do not know how the reserve in the gold standard reserve helps internal circulation. Certainly it did in the past when we had part of it in rupees. Now we have practically the whole of it in sterling securities. That depends upon the position of the reserve.

2581. The final point to which I wish to draw attention on the question of the reserves is:—Is it not the case that, supposing you were to combine these two reserves into one, you would then have an arrangement which would secure an automatic contraction of the currency when such a contraction was required in a time of bad trade and weak exchange?—The point is not clear to me, how the combination will bring about a contraction of internal currency.

2582. (*Chairman.*) That is the first stage in the introduction of a reformed exchange standard system. I will take next your proposals for the introduction of a gold currency, as I understand it, and at this point it would be convenient to have any subsidiary questions upon the matters which we have already covered.

2583. (*Professor Coyajee.*) Mr. Bhatnagar, you speak of the difficulties of contracting the currency when that is desirable, under the former currency system of India.—Yes.

2584. And you think that the difficulties led to a certain over-issue of rupees before the war, since the currency could not be contracted when it was essential?—We cannot say anything definitely whether there was over-issue or not. But certainly if in a country currency needs expansion, as it has been expanding since the beginning of the century well up to 1916-17, it is certain that at certain times when the trade was dull it should have needed contraction, and the system as it was had no provision whatever for a contraction?

2585. Therefore, it was natural that certain over-expansion should have taken place?—Yes, it should have taken place, and it is, to some extent, supported by the trend of general prices in India.

2586. In a word, the working of the gold exchange standard led to an artificial rise of prices to a certain extent?—May have; I could not say definitely that it did.

2587. Now what is that due to, to any inherent defect of the gold exchange standard or to the methods under which it was worked actually; that is absence of a contraction at the proper time, was it due to any inherent defect of the gold exchange standard?—Not to any inherent defect in the gold exchange standard as conceived by the original thinkers of that. That came about simply because under the peculiar conditions in India we had no cheap internal currency like paper currency or leather currency. We had

to have rupees which could not be melted with as great an ease as paper currency.

2588. Suppose there had been a statutory obligation to sell reverse council bills against the gold standard reserve at the proper time and to lock up the rupees; then there could be no talk of the difficulty of contraction?—Am I to understand at the time of a dull trade?

2589. At the time of adverse balance of trade, yes. There was a statutory obligation on the authorities to sell reverse councils against gold standard reserve and to lock up the rupees?—That device could have been utilised under ordinary circumstances as well to bring about contraction. I perfectly agree.

2590. Now I will give you one or two views given by another witness before this Commission. You mention that there was an idea that there had been an over-issue of rupees under the former currency system. Now here is what one witness says: "The exchange standard before the war did not give us stability of prices; but it is wrong to attribute this defect to the absence of a larger volume of circulation or inconvertibilty of rupees and notes into gold. The real cause of the increase of currency was the rising balance of trade in India's favour which could not be liquidated in any other way." Would you agree with that?—We cannot explain as a matter of fact the phenomenon of rise in prices in India. Generally, those who have written about this, they have agreed that the over-issue of rupees contributed to a certain extent; the prices in foreign countries must have also reacted on the prices in India to a certain extent and there is no doubt that the export trade of India also developed very largely during this period and it succeeded in getting very good prices from continental countries and that again might have contributed something to the rise of prices in India. Now to assign what particular influence or what percentage of influence each factor of these 3 or 4 factors at work had seems very difficult to me.

2591. I would add another factor from the same witness: "The commercial contract of India with the world had since 1900 become much closer than before and the presumption is that the lag of Indian price level behind the level of world prices had to be made up during that period"?—We have not been able to make it up even at this time.

2592. (*Chairman.*) Could you repeat the last answer?—I said that the lag of Indian prices is still continuing; our price level is lower than the price level in foreign countries.

2593. (*Professor Coyajee.*) Consequently you do not agree with those who would attribute the pre-war rise of prices solely to the weaknesses of the gold exchange standard system?—No, not exclusively to the gold exchange standard system.

2594. (*Chairman.*) What do you mean by saying that the level of Indian prices is lower? What figure are you taking?—The index numbers of prices, as supplied by the Director of Statistics, Calcutta. It was on this that I calculated.

2595. How much lower is the last general index?—I have got figures up to 1923.

2596. (*Chairman.*) We have more recent figures than those.

2597. (*Mr. Preston.*) With regard to the answers you have given to the Chairman on the subject of contraction, in order that there may be no misunderstanding as regards the part which the gold standard reserve did play in the old gold exchange standard, might I just refer to some actual figures during the exchange decline in the years 1907-08 as the result of the American crisis? The total at the end of 1907 was 17¼ million sterling. Thirteen millions odd was held in England and 4 millions in India. The 4 millions which were held in India in that year represented what, as you stated in a few of your answers, was due to an arrangement which was entered into whereby we kept a reserve of actual rupees in India. Now in 1908, in order to support the sterling exchange rate, reverse councils on the balances in London were sold in India to the extent of just over 8 million sterling. Then the composition at the end of 1908 of that standard reserve was as follows. The balances in London were reduced to 5 million sterling and the balances in India went up to the equivalent of 13 million sterling. So you will see that practically speaking the balances during 1908 were just transposed as from London to India. The result was that 8 million or the equivalent of that 8 million sterling was withdrawn from circulation and held up as the Indian portion of the gold standard reserve and that contraction was necessary in order to turn the scale in the exchange value?—Yes, Sir, I agree.

2598. So far as your memory goes?—I am quite aware of the facts.

2599. I will take the chain a little further. As a result when the market had turned round and the demand again set in for currency by the end of 1911 the total balances held in India had been reduced to inside 2 millions?—From 13 to 2 millions.

2600. Yes from 13 to 2 millions; so that the application as then put in practice with regard to our gold standard reserve produced an efficient and automatic contraction of currency. Do you agree to that?—No I do not agree to the last part of that.

2601. How would you modify it?—If we had in our currency system a provision that during the slack season any individual could secure reverse councils. Supposing during the busy season we had succeeded in sending 4 crores of rupees in active circulation and then we did not want them during the slack season, if during the slack season we could secure reverse councils then these 4 crores would be locked up in the gold exchange standard reserve. Unless we had this provision for giving reverse councils to all sorts of people whether they wanted it for meeting foreign obligations or not we could not say that our system was automatic.

2602. May I point out that where your difficulty would come in is this, that in the slack season through the currency reserve you can get gold for export which is the first line of reserve. You could convert your notes or rupees into gold provided that you export the gold?—Yes we could do that.

2603. But is that not what you told us was part of the old Gold Standard system?—We could secure reverse councils for meeting foreign obligations, and that is what I said, I believe.

2604. The point then comes to this that in so far as the gold standard reserve went, it was capable of causing contraction, big contraction to the full extent of the reserve; so long as the equivalent in local currency of the amounts of reverse councils was held here, specially earmarked away from currency purposes, that represented the amount of contraction which was necessary to turn the scale of the stabilised exchange?—Still the point does not seem to be clear to me. What I noticed under the old system of a gold exchange standard was that when the exports were more than imports in India, then people who had to pay to India could secure a council bill and that council bill was cashed in rupees. In this way, as we had more or less over a very large number of years a favourable balance of trade, rupees went on increasing in internal circulation. Now, similarly, if during the slack season those people who finance internal trade could secure reverse councils, not for meeting the real demands of trade but simply for locking up funds or transferring funds from the Indian market to the English market, then we could bring about a contraction in internal currency.

2605. That is exactly what this method would result in?—But in practice what we find is that funds have come to India for temporary investment from abroad, but funds have not gone out of India for temporary investment in foreign markets.

2606. Then with regard to these figures I have quoted from the 1907 period, that is a concrete period?—True, but it is a case in which we had an adverse balance of trade which created a demand for Indian currency to be locked up in the reserves.

2607. But in that period; let me put it in this way; that produced in that period a large amount of contraction of currency to the extent in local currency of the equivalent of the reverse councils which were bought in India?—Yes, it did.

2608. (*Sir Henry Strakosch.*) You mentioned in the course of your statement that you would consider the time ripe to make notes in this country exchangeable freely into gold, not merely for export but within the country, when sufficient gold had been accumulated to give a cover of 50 per cent. of the note issue. Well, taking the present note issue at about 190 crores, would you regard 95 crores sufficient gold to meet any demand that may be made for gold? —Now what I had in mind at that time was to secure the convertibility of the note issue and the particular figure of 50 per cent. I took was not based on any calculations of mine, but I think that was the figure recommended by the Babington-Smith Committee, and I took it for granted that they must have based that figure on some strong reasons and therefore I took it.

2609. But is it not very risky to recommend convertibility without envisaging what the demand for gold may be at that time?—Are you taking the demand for gold for all purposes or only for securing convertibility of the note issue?

2610. (*Sir Henry Strakosch.*) May I go a step further. We have in this country circulating notes and rupee coins. Both are equally full legal tender. If you allow gold to be drawn obviously you would allow gold to be drawn against rupee coin equally with notes.

2611. (*Chairman.*) Sir Henry, this applies to the second stage or even to the last stage of the steps which the witness described.

2612. (*Sir Henry Strakosch.*) Let me explain. Mr. Bhatnagar suggested that he would start with a gold exchange standard and he would allow convertibility into gold the minute he had reached a reserve against his notes of 50 per cent.

2613. (*Chairman.*) At this point, I thought we might take any supplementary questions on the working of the exchange standard before we got on to his proposals for the next step as regards convertibility, just in order to keep our examination in steps in regard to the exchange standard proposed. Are there any further supplementary questions on the exchange standard?

2614. (*Sir Purshotamdas Thakurdas.*) You said that the Indian has a taste for gold for ornaments and for silver for currency purposes. Did I understand you correctly?—What I really meant was this, that India in common with other countries of the world has fondness for metals for ornaments and that silver is by far the most suitable metal for currency purposes for the masses of this country. That would be my statement if I were to explain it.

2615. Silver is suitable in your opinion for currency purposes in India?—For the masses I mean.

2616. What about the taste of the people for silver currency as against gold? Have they more attraction for a gold currency, or do you think they would prefer to carry on with silver as long as they could have silver available?—It is a very difficult question to answer. Naturally they would prefer to have gold currency, but the question is whether they would be able to utilise it as currency.

2617. Your apprehension is that gold would not be suitable for the masses owing to their smaller incomes?—Smaller incomes and smaller standard of expenditure.

2618. Exactly, well then whence the psychological effect that you refer to, namely, that if gold was not available people would have a craving for gold currency, but as long as they knew that gold was available the hunger for gold coin would disappear. What do you base that on?—That is not my opinion. I quoted Sir James Digby.

2619. That is in your written statement. I thought in reply to the Chairman you spoke of the psychological effect?—What I said to the Chairman was that if we have a note issue in this country and if it is not convertible into gold for internal purposes, then it is likely to create a greater demand for gold.

2620. (*Chairman.*) The witness is referring to the lack of confidence in the note issue.

2621. (*Sir Purshotamdas Thakurdas.*) But take conditions as they are to-day. There is no gold available for notes to-day; the notes are only convertible into silver; do you think there is any anxiety on the part of the people to-day to get gold?—In exchange for notes?

2622. Yes, it is not available as currency?—So far as the masses are concerned, my experience in the villages is that they do not like the notes if they can have rupees; but whether they would prefer a gold coin in place of rupees merely for its colour or greater value and smaller weight I cannot say.

2623. Therefore, if gold coin is available, is there any reason for you to believe that there will be a rush for conversion of the silver into gold?—The class that has got silver to convert into gold is comparatively speaking a limited class, and that class is sure to run for having gold in place of rupees.

2624. But not the masses?—Not the masses.

2625. (*Chairman.*) Let me at this point, before we continue the examination, just open up what the witness does propose regarding the putting of gold into circulation and so on, because both Sir Henry Strakosch's questions and Sir Purshotamdas's questions have anticipated that, and the witness has not really told us what his proposals are. Mr. Bhatnagar's memorandum suggests several alternatives, and I should like to see exactly what it is that he proposes. If there are no further questions on the exchange standard we come to the next step. You told us that, after you have accumulated a sufficient reserve, you will take steps to put gold into circulation. Is that so?—The first step that I would take would be to declare the paper currency convertible into gold, and simultaneously to declare the rupee a subsidiary coin payable only up to a limit.

2626. Is there any other step that you will take?—Yes, and make the notes of the smaller denominations payable either in gold or silver just at the option of the holder of the note.

2627. Do you not mention, too, in your memorandum that you would cease to have the note encashable in silver? Is not that one of your proposals?—When we have declared our notes convertible into gold it follows from that; but as regards notes of smaller denominations I definitely say they should be convertible into gold or silver.

2628. They cease to be convertible into silver?—Yes.

2629. There is a reservation in your memorandum that notes of small denominations should continue to be encashable in silver?—Yes.

2630. The central point is that the rupee ceases to be legal tender except for small amounts, and the note is encashable in gold?—Yes.

2631. Do you consider that before you make the rupee no longer legal tender beyond a certain limit, you must give people an opportunity of converting rupees into gold if they want to do so?—Looked at from the point of view of equity we should do that.

2632. From what other point of view are you prepared to look at it?—You must look at it only from the point of view of equity; otherwise it will have a very bad effect.

2633. That rather suggests to me that you think it would be equitable, but that you do not think it will be possible?—Certainly it will cause some loss. Government will have to provide—one does not know how much—gold.

2634. Would you expect very much gold to go into active circulation under this proposal?—So far as the cities are concerned gold will come into active circulation, but so far as the rural areas are concerned, I

believe it will go only into hoards under the present circumstances.

2635. It would go into circulation if the equitable course be taken of allowing an opportunity for the conversion of rupees into gold?—Yes.

2636. Have you been able to make any estimate of the likely demand for gold for rupees from hoards under these circumstances?—No, I could not tell you anything on that. It is very difficult to estimate the amount of hoards in India.

2637. In the absence of any such estimate it must be difficult for you, is it not, to arrive at the point as regards the accumulation of reserves which would make it possible to take this step?—Yes; we will have to make some sort of a clever guess; and you might have some definite period, three or six months, within which people should change their rupees for gold, and after that they would not be able to do it.

2638. Do you think that would be a sufficient period in a country such as India?—I think one year will be quite a sufficient period.

2639. Are there any further details that you would like to add just to assist us to understand your proposal as to the introduction of a gold standard?—When we have done these things, that is made our notes convertible into gold and made the rupee a subsidiary coin tenderable only up to a limited amount, then I also mention in the memorandum that we should adopt some methods to make the note circulation more popular.

2640. You have suggested the restoration of the note of small denomination?—I do not suggest the restoration of one-rupee notes.

2641. What measures then are you referring to as regards the popularisation of notes as currency?—Just as during the war, when there was money to be paid the first offer was made in the form of notes, and it was only after the note was refused that rupees or other coin was given, similarly we could adopt some such attitude in the case of council bills; they should be paid first in notes and only when people do want expressly to have gold, then it should be given to them; and some propaganda work may be undertaken to educate the people in the use of paper currency.

2642. (*Chairman.*) The Government should act as a good salesman and press its wares. Now we have arrived at the point where I interrupted you, Sir Henry.

2643. (*Sir Henry Strakosch.*) My question has been answered, I think. Mr. Bhatnagar has stated that he could not estimate the amount of gold which would be necessary to satisfy all the demands of the country, when he makes gold freely available by making the notes convertible into gold?—Unless we have some accurate idea of the hoards in the country; I personally cannot put forward any definite figure—it would be more or less approximate.

2644. You will admit, however, that it is very essential to know what the requirements are so as to be able to make the necessary provision to supply gold when it is demanded?—True I realise the difficulty.

2645. And have you realised what the expense to the Indian exchequer would be to put gold into circulation, and what its effect would be upon the purchasing power of gold generally and therefore on commodity prices in India?—If a very large quantity of gold is needed to come into active circulation, then it certainly will raise the price of gold in terms of commodities; the general price level will fall in terms of currency. But I do not know if I am right in thinking that; my idea is that very large quantities of gold are not likely to go into active circulation in India, and for this reason, that a greater part of the population is living in the villages, and under existing circumstances in rural areas gold is not likely to form an appreciable part in active circulation.

2646. There is one other question I wanted to ask: you suggest that when gold is put into circulation you would make the rupee a token coin of limited legal tender?—Yes.

2647. And you would make the notes convertible into gold except that notes of smaller denomination should be convertible into a rupee token?—Or into gold, just at the option of the holder.

2648. I want to put to you this question: If it were found that to allow gold to be drawn indiscriminately for internal purposes were an unbearable burden for India and if it were found that the gold exchange standard was the most suitable form of currency, would you see any great difficulty in confining the convertibility of the note into foreign exchange or gold for export only?—As a matter of fact it will come about ultimately under my scheme as well; but after thinking long over this problem I have come to this belief, that in India, unless we have made gold once freely available to the people, we will not be able to remove the attraction for gold which is existing and which is getting a very large quantity of capital in unproductive uses; and practically the one reason in my mind for recommending the free introduction of gold into active circulation is to educate the people in the use of gold.

2649. I should like to ask another question in that connection: I take it that you would be not in favour of confining the convertibility of the notes into gold for export or for foreign exchange under a gold exchange standard. Am I correct in that assumption?—Under gold exchange standard we will have notes only and the rupees also only convertible into gold for foreign exchange purposes.

2650. Not for rupee coin? At present the notes are convertible into rupee coin. Would you see any difficulty in taking away from the note the right of conversion into rupee coin and confining the convertibility into gold for export or foreign exchange?—Then the note will become inconvertible so far as the internal circulation is concerned; that will have a very depressing effect.

2651. Would you consider the same to apply if you were to prescribe that notes above a certain denomination shall only be convertible into gold for export or for foreign exchange and notes of a small denomination convertible into either?—No; in the beginning I would have notes convertible both for internal circulation as well as for foreign exchange because my idea is to utilise that stage of currency development as an educative process, to remove the fondness for gold from the Indian mind.

2652. (*Chairman.*) I think, as a matter of fact, these matters are so very clearly stated in your memorandum that I have not any elucidatory questions to ask you upon that point.

2653. (*Sir Henry Strakosch.*) But you see no impediment of an intrinsic character to the suggestion I have just made; I mean, you would not see any difficulty in maintaining the purchasing power of the rupee stable even if you took away the right of convertibility into the rupee coin?—All the notes? May I know, Sir, if you are referring to the exchange rate for foreign purposes or for internal purposes?

2654. Both.—The question, I am afraid, is not clear to me.

2655. I wanted to know whether if you took away from the rupee note the right to be converted into rupee coin the purchasing power of that note would in any way be influenced by this curtailment of right?—I think it would be. During the war we know, for example, notes were not freely encashable into rupees and that led to a great depreciation in their value.

2656. But if those same notes had been convertible into gold for export or foreign exchange, would the notes have depreciated?—In the rural areas they would have depreciated as they did in that scheme. In cities like Bombay or Calcutta it may not have led

to depreciation in their value, but so far as the up-country towns and up-country rural tracts are concerned the position would have been exactly the same.

2657. It would?—Yes, what does it matter to an up-country man living in villages whether the notes are convertible into gold for external purposes or not if they are not encashable within the country where he is living.

2658. But would not the exchange broker in Bombay or Calcutta immediately step in when the notes had reached a certain discount and buy them because he knows he can get foreign currency for them?—The point I was referring to is that if notes are not encashable in the internal currency whether in gold or rupees for internal purposes and are only convertible for foreign exchange purposes then we will have in the up-country towns and small towns and villages, *batta* (discount) on notes.

2659. I see?—I do not know how the brokers in Bombay and other places could help it.

2660. By sending up coins and buying the notes at a discount?—That means another source of profit at the expense of the masses to brokers in the big cities.

2661. True. But equally that discount would be kept within their moderate limits just the expense of shipping the coin to the place?—But why should we have that at all?

2662. (*Sir Henry Strakosch.*) I was merely pointing out that there is a limitation to what you say. I appreciate your point perfectly. Thank you.

2663. (*Sir Purshotamdas Thakurdas.*) There are few questions to ask in view of what Mr. Bhatnagar has said since I put off my question. I would just like to put it to you, if, Professor Bhatnagar, you said that gold currency will not go much into rural areas?—Yes, that is what I said.

2664. Well, then the rush for gold currency when it is made available will be merely by those who have hoards?—In the greater part of the country, we will have a rush from people who have hoards in rupees.

2665. And you yourself are not able to tell us what is the amount in hoards nor how many hoards there are?—No I could not tell you.

2666. You have no information at all about it?—I think as far as my knowledge goes, no estimates about hoards have been made so far. I have no idea.

2667. You are aware there are some people in India whose opinions are worth consideration who believe that this question of hoards is, except up to a certain limit, more or less a myth and exaggeration. Have you heard that?—I myself believe that so far as the masses are concerned there is not much of hoarding, but I know definitely some cases where hoards do exist. There are certain classes, although it may be very difficult for us to believe it, I know 2 or 3 cases, where a man simply keeping about 90 lakhs of hard cash, and there is a gentleman in Agra (anyone can see his papers and find it out) who has 90 lakhs hard cash which he is not using in any productive enterprise. The Collector and the Commissioner wanted that the money should be deposited in Government promissory notes during the war, but the gentleman refused to do so, although he contributed to the war loan about 10 or 20 lakhs. He said that this money was the backbone of his whole business and that it was not meant for investment. We have got such instances.

2668. Exactly. That is the point. These are men who hold the other view which I put before you that there are hoards up to a point, but they are not up to the percentage of the total circulation that appears to be generally believed by some in India or outside India?—The whole difficulty is that the whole question is to be discussed in terms of vagueness.

2669. That is it, it is a question of guess?—I have no definite idea about it.

2670. What is the total circulation of rupees in India?—I could not tell you that without consulting some publication.

2671. What do you think would be a fair amount of rupees that may be allowed per head of the population, knowing their means, knowing their income, and their fondness they have for silver coin, what would you, as a person who has studied this question very fully, allow?—We could not have any definite figure for any long time because the income of the different people would be increasing or decreasing. The number of rupees per head for exchange purposes for a certain class first of all will have to vary with each class and for each class it will depend upon its income and expenditure.

2672. I was only asking, Professor Bhatnagar, if you are in a position even to give a rough estimate of a figure you may have thought of?—I have not thought of it as a matter of fact.

2673. Then, could you tell the Commission regarding the Chanakya Society in Patna that you have referred to in your statement (page 103, Appendices). What is that society and what are they doing?—It is a society consisting of students and Professors of Patna College. It has been in existence for the last 10 years or so. They have a number of lectures. They organise number of lectures on economic subjects. They go outside and study the condition of the different classes of people. They have collected a large number of family budgets, and also published them in a bulletin form. They go and study individual industries, and write small monographs on them. That is their function.

2674. They are carrying on some sort of statistical work in connection with the economic condition of the people of India?—They are collecting in their neighbourhood the family budgets.

2675. It is only confined to their own province?—Not even to the province.

2676. Then to their own district?—Yes.

2677. Then the Economic Board of the Punjab is a Government Department?—No, it is not a Government Department, although it is helped by Government. It is a public body.

2678. Do they keep on issuing statistical information regarding the Punjab or all India?—From time to time they publish some small monographs with regard to the Punjab only.

2679. (*Chairman.*) Would it assist you if we ask the Secretary to procure copies of the publications of these societies?

2680. (*Sir Purshotamdas Thakurdas.*) I thought so. There was a question raised by Sir Henry Strakosch at an earlier stage whether there were any private bodies in India which carried on the collection of figures, and I thought, Professor Bhatnagar, since he mentioned this point might give us some interesting points or perhaps specimens of what sort of work these authorities do and that might interest some of us. I knew myself something about these institutions but I thought the witness might know more.

2681. (*Chairman.*) We might get a copy of the latest publication of this society.

2682. (*Sir Purshotamdas Thakurdas.*) You mentioned in the course of your earlier reply the case of a gentleman and the amount of cash hoarded by him. I think you said 90 lakhs.—Yes.

2683. Do you think that represents the average amount that the said person keeps in hoard?—As far as my knowledge goes he says that was the backbone of his business and it was never to be invested, but it was to be kept. It was a sort of standing hoard whether it was war period or normal period.

2684. (*Sir Reginald Mant.*) Mr. Bhatnagar, I understand that you advocate the introduction of a gold currency as soon as Government has accumulated a sufficiently large gold reserve to meet all possible demands? Is not that your position?—I do not say all possible demands. I say as soon as it has accumulated sufficient gold to make paper notes convertible into gold. That is, we have got 50 per cent.

We may have some other percentage. I will not stick to 50 per cent. because one cannot say what percentage will be necessary to back up our note circulation. That was the figure given to us by the Babington-Smith Committee. This figure should always be calculated by some experts and not by theoretical people like myself.

2685. Then you would introduce gold currency as soon as 50 per cent. of the Currency Reserve is in gold?—I would make paper currency convertible into gold as soon as we have got this 50 per cent. gold of the note circulation.

2686. And supposing that that gold was drained away in exchange for rupees, is not there a risk that your notes would then become inconvertible because Government would not have sufficient gold to meet them?—For that you have to make a separate provision when we declare our rupee to be a subsidiary coin. As I pointed out some time back to the Chairman, we will have to give some little time to the public to change their rupees into gold, for that we will have to make some provision. How much that will be I could not say.

2687. (*Chairman.*) That is in addition to the 50 per cent.?

2688. (*Sir Reginald Mant.*) Well then, you would not make notes convertible into gold until you had accumulated another reserve to meet the possible drain of rupees? Is that your position?—Certainly.

2689. You cannot estimate what the amount is likely to be which will be required for that reserve?—I have not made any attempt to estimate that. It may be possible to have some rough estimate of that made in the Currency Department of the Government of India.

2690. But if you cannot form an estimate of the amount of gold required, how are you to know when the time has come to make your notes convertible into gold?—I do not mean to say that we cannot estimate, that there is no possibility of ever estimating the money required for exchange of these rupees. What I say is that I have not attempted to do that part of the problem.

2691. (*Sir Maneckji Dadabhoy.*) From the result of your discussion I understand that you feel the difficulty that it will be almost impossible to make the estimates of the required gold?—It will be difficult, no doubt, but I do not believe it is impossible. We must arrive at some workable figure. Unless we do that, we cannot adopt the system.

2692. You will agree then that it will be extremely risky for the Commission to recommend convertibility without making sure of the actual gold requirements?—Certainly, for a body like the Commission, it would be very dangerous to make that recommendation without having some idea more or less accurate of the quantity of the gold required.

2693. And at present there is no reliable data for making such estimates available?—I am not prepared to say there is not reliable data because I have not attempted even that.

2694. (*Chairman.*) I think Mr. Bhatnagar's evidence on that point is very self-consistent. He says that he would take the step, but he would not take it until he had reserves adequate to cover the purpose. He himself is unable to make an estimate of what those reserves would be, but he thinks that it is not impossible that somebody with the final information may be able to get the requisite information based upon that hypothesis?—I do not know why it escaped from my mind at that time. That part of the problem has only just become prominent to me. That is why I feel some hesitation in offering any definite ideas on the subject. I may try later on to attempt that problem.

2695. If you arrive at any results I am sure the Commission will be most interested to have any further notes on the subject. I have only one further question to ask, and that is with regard to the question of stabilisation, with which you deal at some length. I understand it is your opinion that if a rate is to be chosen for stabilisation of the rupee it should be the current rate round about 1s. 6d. Should I be accurately expressing the general trend of your argument if I say that you chose that rate because on the whole it will cause less disturbance?—That is my idea.

2696. And that you know of no argument for another rate which would weigh against the undesirability of the disturbances which will be caused by working to the other rate?—That is the general position.

2697. That is the general position you occupy?—Yes.

2698. As against the 18 penny rate I understand that you had advanced one difficulty and that is that it does not make the rupee into a whole fraction of the sovereign?—Yes, that is the main difficulty.

2699. (*Chairman.*) These matters are dealt with so clearly in your memorandum that I have no further elucidatory questions to ask upon them. Are there any supplementary questions which members would like to ask?

2700. (*Sir Purshotamdas Thakurdas.*) Mr. Bhatnagar, towards the end of your memorandum (page 111—Appendices), you say, "May it not mean that as new conditions created by the war will have assumed a more or less permanent character their result on India will be a new adjustment of her exports and imports, as well as of her price level within the country." Now, the price level of all countries—important countries at any rate which have had a solvent currency left after the war—has advanced, hasn't it? Take the United Kingdom as compared with 1914. It is higher to-day than it was in 1914. Take the U.S.A. It has advanced. Your own statement shows that?—But lately they have been going down.

2701. And so has the price level in India been going down?—It has not gone down to the same extent.

2702. Yes, but the broad fact is that the price level has gone down alike in all countries more or less?—What do you mean by "alike"?

2703. They have all gone up to a certain point 30 per cent. or 35 per cent., whatever you like to call it?—As compared with 1914, which I take as 100, in India the price level is at 133 to-day, while in the United Kingdom it is at 162 (table B). They are based on the index number.

2704. (*Sir Purshotamdas Thakurdas.*) I know professor Bhatnagar has given the levels for 1923, and I propose with your permission to ask him about the figures on which he has himself relied.

2704A. (*Chairman.*) I was not quite sure where Professor Bhatnagar's figures actually came from. Those of India for 1914, to which I think you are referring, are from the official index.

2704B. (*Sir Purshotamdas Thakurdas.*) I am only taking it as a basis and the accuracy of the figures hardly matters. Have any of these countries thought it necessary, or indeed advisable, to change their pre-war ratio in order that the price levels may be controlled thereby?—No other country has had the peculiar currency condition that we have passed through. That is our difficulty.

2705. Namely?—We had a system before the war. We stopped the working of that system, we left the rate of exchange to take its natural course. Before no other country has this problem come up in this particular form. What should be the rate of exchange? It is only before us the question has come.

2706. It is, according to what you say, because of the defects in the currency policy of the Government of India till after the war that you think it is justifiable to change our pre-war ratio. Is that correct?—I would put it this way that because the system we were working upon broke down somewhere during the war and after, whatever may have been the cause of that break-down, we will not enter into

that—that now we have been compelled to ask ourselves the question what should be the new system to be officially introduced.

2707. It broke down and a readjustment was arrived at at a time when the currency systems of other countries also were wide apart from their pre-war normals?—Yes.

2708. Therefore you say that you favour a change in this ratio because a change in the ratio was made in 1920?—Yes, but as a matter of fact, we have not been having a fixed ratio all this time.

2709. But England till lately aimed at a return to the pre-war gold point and brought back the ratio to the pre-war point?—It is not they that have brought it back. It is the conditions of trade that have brought it back.

2710. Would it come back to India if there was no change?—It did come back to 1s. 4d. after going up to 2s. 11d.

2711. And still you approve of the new ratio being fixed at 1s. 6d.?—What I say is that it may have been a mistake not to have stabilised when we had the ratio of 1s. 4d.

2712. Do you agree that it was a mistake?—The whole policy was a mistake that was adopted by the Babington-Smith Report—there is no doubt in my opinion about that.

2713. In your opinion it would have been correct to stabilise at 1s. 4d., when we did reach 1s. 4d., gold?—I am not prepared to make that statement either. The only statement that I am prepared to make is that the adoption of the definite measures of currency after the report of the Babington-Smith Committee, when the conditions in the world were not stable enough for the adoption of any permanent policy, was wrong. Having made one wrong move, the Government had to go on and make other moves.

2714. And this is the logical sequence of it which you are prepared to approve?—Logical or unlogical, we have got to make the best of it.

2715. Supposing the rate had been rushed up to 1s. 7d., would you have approved of that?—Provided you convince me that this rate of 1s. 6d. has been rushed up too.

2716. Supposing it was brought up to 1s. 6d.?—If I was convinced that it was deliberately brought about by the Government I should take a different view. But because I believe and honestly believe that it has come about because of trade conditions in India and in foreign countries, I say: better keep it.

2717. But if you were in such touch that you had reason to believe that it was worked up to then your ground for support of 1s. 6d., that you mentioned to-day would not weigh with you?—Perhaps not.

2718. Then at the beginning of the fifth paragraph from the end of your memorandum, you give us reasons why the rate should not go to a higher figure than 1s. 6d. And you say that that would mean injustice and hardship to a lot of people in this country. It would mean injustice and hardship because a change has to be made from the present figure. Or would it mean injustice and hardship because the change to 1s. 8d. is by itself undesirable?—Any departure whether downwards or upwards from the figure existing to-day would mean a hardship or injustice to one class of people or another.

2719. Did it mean hardship and injustice to a lot of people in the country when the figure was changed from 1s. 4d. to two shillings?—You are referring to the war period when the rate of exchange was raised.

2720. After the war, was it not? The change was made in the statute here in 1920?—The legal change, otherwise the rate was going up the whole time. The legal change as a matter of fact was never effected.

2721. The Government gave out gold coin on the basis of Rs. 15 in 1918?—But for a very short time.

2722. But they did. As far as the legal ratio was concerned, it was effective?—It was not effective in the sense that it was never maintained in foreign exchange.

2723. The change from 1s. 4d. to two shillings in your opinion caused no hardship then to India?—The change from 1s. 4d. to the legal ratio came in the middle when we were already at a very high rate.

2724. Therefore it did no harm?—Not as much harm as it would have done if we had raised it of a sudden from 1s. 4d. to two shillings.

2725. You believe that a change from 1s. 6d. to either a higher or lower figure would be undesirable because 1s. 6d. is the rate prevailing to-day?—And because people have made their contracts at the prevailing rate.

2726. What contracts have you in mind?—The exporters and importers must have based their contracts on the basis of this rate and must be expecting payments on the basis of this rate.

2727. Therefore, the disturbance to the commercial community is what weighs with you?—Yes; and then again the change will react upon the price level also to a certain extent, and that might cause some hardship to some people.

2728. There is just one more question, that is in connection with the following remarks you make (page 110 Appendices)—"we should therefore for the time being resume the gold exchange standard system as we had it during the pre-war period and be ever watchful for the accumulation of gold in India in the paper currency reserve till we have brought it to the level of fifty per cent. of the note circulation." What are the special precautions that you think should be taken for this watchfulness"?—As I have also mentioned in the memorandum, first of all we should keep the whole of the paper currency reserve in India.

2729. I just want to know whether you want it to be enacted by statute, or you think that there should be any special watchfulness exercised by the Indian public?—Not by the Indian public.

2730. In the statute it should be made compulsory on Government to do so?—Exactly. At the end of the memorandum I specially mention these points.

2731. And it should be made compulsory on Government not to depart from what you recommend, should be enacted by statute?—The Indian currency system should no more be worked by the mere decree of the executive; it should not depend on the will of the executive but should be based on definite legal enactments.

2732. That is the change that you want from the pre-war system?—Yes, and a very important change.

2733. (*Chairman.*) As I understand it, you think that every sharp or sudden or artificial change in the rate of exchange does harm to somebody?—Yes.

2734. And therefore you conclude that the fewer the changes the better, and that is why you are in favour of the maintenance of the present rate?—Yes.

2735. And you consider that the present rate is the result of the balance of economic forces rather than any artificial action?—One point was recently brought to my notice in this connection, and that is that Government has not been coining sufficient rupees. That might have contributed to the result to a certain extent, but largely speaking I should think it has been the result of economic forces.

2736. (*Sir Maneckji Dadabhoy.*) You have given two reasons for keeping the present rate—that it is both desirable and justifiable to take a higher rate of exchange than we had before the war, not only because it would keep prices low for the masses, but further because it would give greater protection in the future against another rise in the price of silver. The first point my colleague, Sir Purshotamdas Thakurdas, has dealt with. I would like to ask one or two questions with reference to the protection which you like to secure in future against another rise in the price of silver. You will admit that the extreme fluctuations in the

price of silver during the war are not likely to recur again?—Unless we have another war or so.

2737. Of course if another war takes place, the currencies of the world will all be upset?—I cannot say that definitely, but more or less that will be so.

2738. Then your object is to provide a suitable margin by keeping this rate of 1s. 6d., I understand?—I have selected the 1s. 6d. rate because it is the existing rate and is likely to do the least harm to all concerned. But that is only a subsidiary argument to my main point.

2739. You want the present rate as it provides a suitable margin of protection against the price of silver and the melting value of the rupee?—Yes, it does.

2740. And therefore you desire to keep that rate? Yes.

2741. Will you tell me what amount of margin as represented in pence would be a suitable provision? —That entirely depends on the actual rise in silver, and one cannot make an estimate how far the price of silver may go in the future.

2742. Take the last price. In the last financial year we had fluctuations between 36 and 31d., and it went even lower down. Why do you want to keep this extreme margin of safety?—I have said at the very outset that I have not selected this rate to provide a margin for the rise in the value of silver; that is not my argument at all; I simply point out by the way that if ever the price of silver rose, there we would have a margin.

2743. You have not considered in dealing with this question how the price of silver actually affects the position. You speak about protecting silver against a future rise. Then in making that assumption you have not taken the actual margin of safety that is required?—I never approached the rate from that point of view.

2744. It might be possible that a small margin would be an adequate protection?—Perhaps.

2745. (*Chairman.*) There are no further supplementary questions to ask, I think. I should like to express our thanks to you for your assistance to-day and for your memorandum.

(*The witness withdrew.*)

NINTH DAY.

Friday, December 4th, 1925.

Present:

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Arthur Mant, K.C.I.E., C.S.I.
Sir Maneckji Byramji Dadabhoy, K.C.I.E.
Sir Henry Strakosch, K.B.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.
Mr. A. V. V. Aiyar, C.I.E. } (*Secretaries*).
Mr. G. H. Baxter. }

Professor Gyan Chand called and examined.

2746. (*Chairman.*) Professor Gyan Chand, you are a Master of Arts and Professor of the Economics Department in the Benares Hindu University?—Yes.

2747. Since when have you occupied that position? —I have been teaching economics for the last five years.

2748. Before that, what was your position?—I was a student.

2749. You have occupied that position since your student days?—Yes.

2750. You have been kind enough to furnish us with a very full memorandum* setting out your views in relation to the Indian currency. If I may, I will ask you a few questions in order to ascertain the degree of emphasis which you lay upon the various points raised and to elucidate any matter which seems to require elucidation. It will be most convenient if I turn, in the first place, to the summary of conclusions given in paragraph 22 of your memorandum. Will you, in the first place, tell us, in relation to your conclusion that India should endeavour to have a gold standard, what in your opinion are the principal advantages to be gained by the adoption of a gold standard?—One advantage of the gold standard is that it will command the confidence of the people. Gold exchange standard somehow or other has begun to be suspected, and if we can put gold standard in its place without creating any other embarrassment for ourselves, we will thereby be creating an atmosphere of confidence.

2751. Confidence in what?—Confidence in the basic features of the system. That it is a sound currency and likely to work well. A belief of that kind will be generated by the establishment of a gold standard.

2752. (*Sir Alexander Murray.*) At this end we do not catch what the witness says?—I was asked to say what will be the advantage of establishing a gold standard in the country. I say that one advantage will be that it will create an atmosphere of confidence.

2753. (*Chairman.*) Then the further question was, confidence in what?—Confidence in the fundamental basis of the currency system; in its soundness.

2754. What would soundness mean in that connection?—Soundness would mean different things for different people. But a general belief that the currency system of the country is being worked in the interest of the country makes the system a sound

* Appendix 15.

system. The general feeling itself is a matter of some importance, and since the people are likely to have greater faith in gold standard rather than in gold exchange standard, that will certainly be a distinct advantage.

2755. The confidence then would be that the system was in the interests of the country?—Yes.

2756. What circumstances in the system would people fix upon as being in the interests of the country?—People generally do not reason about things very clearly. When they vaguely feel that the system is a gold system and it is worked in the interests of the country, they are satisfied with it. If the reverse impression gets abroad, people feel differently, and then, in spite of the fact that the system is a good system, they are likely to distrust it.

2757. Then, in the first place, the advantage of the system would be in producing in the uninstructed a sense of confidence?—I do not mean to suggest that it will create an atmosphere of confidence only among the uninstructed. The number of people who understand currency system and currency matters is very small indeed. Even the instructed people are likely to have greater faith; even people who understand these things are likely to have greater faith in the gold standard rather than the gold exchange standard. I do not mean the illiterate masses only.

2758. Let us then turn to the opinion of the instructed. I understand that, in your opinion, they, too, would think that the gold standard was in the interests of the country. That, indeed, is your opinion as one among the instructed, is it not?—I merely put it that way; that people in general will prefer to have gold standard rather than gold exchange standard.

2759. Let me pass on from what you have very clearly described as the general atmosphere of confidence in the public at large to what are the real reasons which, in your opinion, would make the gold standard the best for the country?—It will to a certain extent simplify our exchange problem. In the immediate future probably exchange will have to be left to take care of itself; but ultimately when gold standard can be established and conditions are ripe enough for the purpose——

2760. Conditions are ripe enough for what?—For the establishment of the gold standard. The establishment of gold standard will simplify the exchange problem. But it might not solve it. Then, also, it may need further looking after. But the problem of exchange will be simpler under gold standard than under gold exchange standard.

2761. Will you outline the nature of the simplification which would be effected by the adoption of a gold standard?—I do believe that an exchange when gold standard is finally established will be looked after by the banks, exchange banks, though to a certain extent the banks will need the assistance of the National Currency Board whose establishment I recommend in the last paragraph of my memorandum. This knowledge that gold is available in exchange both for internal and external purposes will create confidence and reduce the responsibility of the Government for the maintenance of exchange. The essential difference between the gold exchange standard and gold standard is that while under the former, that is under the gold exchange standard, gold is not available for internal purposes; under gold standard, gold is available for internal purposes as well.

2762. I understand it is your opinion that, if gold is made available for the internal purposes against rupees, it is unlikely that there will be any large demand for gold to be actually taken out for internal purposes?—Internal circulation, yes.

2763. Let us distinguish between the purpose to which you have just referred for internal circulation and the further purpose for the conversion of silver hoards. What is your opinion as to the probability, if the right to obtain gold against silver be given, of any amount being taken by the public in substitution for silver hoards?—Do I understand it that I am to give my opinion as to the amount of gold which will be required?

2764. Whether any will be required, and, if so, whether you can make any estimate as to how much will be required?—Gold is likely to be required for two purposes, one for the purpose of internal circulation and the second for hoards and ornaments. As for internal circulation, I believe that the amount of gold required will be very small indeed, and therefore we need not have any misgivings on that score.

2765. Upon what do you base that opinion?—Gold is unsuitable for every day payments. Payments are very small in most cases, and gold is not likely to be passed from hand to hand.

2766. Are you taking into consideration also, to any extent, the past experience of the Government of India as regards the promotion of a gold circulation?—Once or twice they have tried to put gold into circulation, once between the years 1860 and 1870 and then again from 1900 to 1902, and on both the occasions gold came back. It did not get into circulation. They tried to put it into circulation, but it returned to the Treasury; and therefore the presumption is that the people are not likely to make use of gold for currency purposes to any considerable extent. From our own knowledge of economic life we know very well that for the masses gold is unsuitable for everyday use. Their income is very small; their payments are very small, and they are not likely to make use of gold.

2767. Now let us take the second possibility?—That depends upon the rate at which gold is available. If the Government rate is not more favourable than the market rate, there is no reason why people should go to the Government when they get as much as they like in the market. They are already paying as much money for this unproductive use as they can, and I do not see any reason why people are likely to go to the Government when Government is prepared to give it at the same rate as they can get it in the market.

2768. Do I understand this to be your opinion, that the demand for fresh gold for hoards and for ornaments would continue to be supplied through private sources as at present?—It should be supplied by private sources.

2769. Then there is the third possibility to which I would refer you, and that is if gold is freely available against rupees it might result in the conversion of large hoards of silver rupees which at present may be held in the country. What is your opinion as to that possibility?—We do not know as a matter of fact the magnitude of these hoards. We cannot calculate what is the amount of rupees which are lying in hoards; but we take it for granted that the fact that the people do not now convert silver into gold shows that they prefer silver to gold under the present circumstances. They prefer to preserve their hoards in that form and so they are likely to do the same if the gold standard is established. The mere fact that the Government is prepared to give gold does not make them more eager to get gold.

2770. Let me put a further supposition to you in this connection. I understand it is your advice that, on the adoption of the gold standard, the rupee should continue to be unlimited legal tender?—It is not my advice. But I think that it is not possible to dethrone rupees for some time to come.

2771. That is what I wanted to ask you?—I would, if I had my way, like the rupee to go. But it would lead to some embarrassment and is likely to create trouble. It is not in our hands to withdraw rupees from circulation, after they have occupied a very prominent position all these years.

2772. Referring to this possibility, you say in paragraph 12:—"The remedy will be heroic and possibly efficacious, but as far as it is possible to look ahead, it will not be practicable." I want to ask you why, in your opinion, the limitation of the legal tender of the rupee, as far as it is possible

to look ahead, will not be practicable?—Well, on account of a very old and long established habit people have come to believe that the rupee is the standard coin of the country. They have put by their money on that supposition; contracts have been entered into on that supposition; and if you now demonetise the rupee or make it a token coin in the ordinary sense of the word, that will be considered a breach of faith and the masses are likely to feel it much more than any other measure which Government is likely to take for establishing a sound system of currency in the country.

2773. I did not quite apprehend your last sentence; might I have it again?—I said people have come to believe that the rupee is the standard coin; all their contracts have been entered into on that supposition; money has been put by in hoards, and if you dethrone the rupee from its position the people will consider it a breach of public faith and it is likely to cause a very great amount of dissatisfaction.

2774. But under your proposal, as I understand it, for the final introduction of the gold standard, you would be prepared that the Government should take in rupees and pay out gold at whatever the rate then was?—Yes.

2775. After that right had been conferred upon the public for a period, would you consider that after that period it would still be in the nature of a breach of faith with the public to limit the legal tender of the rupee?—The period will have to be very long; long enough to make the people feel that the change is going to be brought about. I will also suppose that the people have been weaned from their habit of using silver rupees. Just now they seem to prefer silver rupees to note and gold. If after the gold standard has been established a period long enough to get people accustomed to the new state of things is allowed to lapse, then possibly it will be practicable to make the silver rupee limited legal tender.

2776. What considerations should be taken into account if an effort were made to estimate how long that period should be?—It is really very difficult to say. It will all depend upon economic conditions in India, and also the habits of the people, whether they have taken to gold and notes more readily than they were doing before.

2777. What economic conditions will be relevant in this connection?—The greater economic prosperity of the people and their ability to do without a small coin like the silver rupee. If people are prosperous and payments are comparatively large, rupees can certainly be done away with.

2778. If we look forward to a time at which it was equitable to limit the legal tender of the rupee would that, in your opinion, have any very great effect upon the amount of rupees in active circulation?—Well it depends on whether you make rupees limited legal tender up to a thousand rupees. I mean if the legal tender is limited up to a thousand rupees and not above, then it may not affect that amount.

2779. Let me take some more usual figure, say, fifty rupees?—Well, I think if you fix that amount, to a certain extent I cannot say how much the active circulation of rupees will be decreased because rupees are being used for contracts involving very big amounts, not thousands but certainly they are being used in hundreds, and if you make it legal tender only up to Rs. 50 I daresay the active circulation of rupees will be thereby decreased.

2780. One cannot of course make a precise estimate about so hypothetical a matter, but would you be contemplating a very substantial increase of rupees in circulation some 5 or 10 per cent. increase or a sum of that order?—I will take two things into account, first, the limitation regarding legal tender, and secondly the economic condition of the people. If people are better off and their individual payments are bigger than they are to-day then the reduction of the silver rupee circulation will certainly be substantial. But if people continue to be poor, as poor as they are to-day, then I do not anticipate any appreciable reduction in the circulation of the silver rupee. It all depends upon the economic prosperity of the people.

2781. I want now to call your attention to the question of the degree to which it would be necessary to accumulate gold in the reserves before, in your opinion, it would be safe to take the step of the introduction of a full gold standard. I think somewhere in your memorandum, if I remember aright, you express the opinion that there should be a reserve of 50 per cent., do you not?—At present what I say is just this, that we have got about 200 crores of rupees in circulation and we have about 180 crores of notes in circulation. If we convert our silver rupees into paper currency reserve and our sterling securities into gold we can get about 50 per cent., of gold as a backing for rupees and notes in circulation, and that I should consider adequate under the circumstances.

2782. That is upon your assumption that there would in fact be, as the result of this step, no great demand for gold to be taken out either in the form of currency or in substitution for silver hoards?—Well, even if we allow some substitution for silver rupees by gold, still 50 per cent. ought to be enough as a backing for silver rupees and currency notes. It is a very big amount and I daresay it will carry us through.

2783. Now let me put to you the supposition, which I ask you to accept knowing that it is a mere supposition, that there are 150 crores of silver rupees in hoards; and let me put to you the further supposition that the result of the adoption of this measure, that is, the introduction of the gold standard, led to a demand for gold in substitution of the whole or the greater part of the silver hoards of the country; in the first place, you would agree, I imagine, that that is a possibility though you do not look upon it as a probability?—I consider it a possibility so very remote as not to be worth while taking into account.

2784. So I understand. Now let me ask you to make a further supposition, that some such demand does arise. Under those circumstances would you consider that the reserves to which you have referred would be adequate for the safe introduction of the measure?—These reserves have been taken just for the purpose of illustration. I do not attach much importance to them. The total amount according to me will amount to about 170 crores; if 150 crores of rupees are in hoards and all of them seek conversion the gold standard will certainly break down.

2785. It is making suppositions that you do not desire to make?—I would not like to subscribe to them.

2786. (*Chairman.*) So I understand. Of course the answer to my question is, as it were, a necessary answer. Now let me proceed to the next step, but before I do that I think I might ask if there are any supplementary questions on that point, as I am now going to introduce a new topic.

2787. (*Sir Rajendranath Mookerjee.*) Having regard to the fact that within the last few years there has been established a system of co-operative banks in the villages, and also to the fact that the Imperial Bank has established nearly 100 branches all over the country, is the habit of hoarding for which the Indian has been noted, in your opinion, on the increase or on the decline?—If we are to judge from the amount of gold imported——

2788. I am not talking about silver or gold but about the Indian's habit of hoarding?—Yes, one very good index of whether the habit is increasing or decreasing is to find out the total amount of gold that is imported for consumption purposes.

2789. Considering that the banking system is fast spreading all over the country, is it not possible that the habit of hoarding is now on the decrease?—Well it is very difficult to make a definite statement on that point, but, as I was saying, one very good index for finding out as to whether this habit

is increasing or decreasing is to find out the amount of gold we are importing every year; and that as you know very well has been increasing. Last year it was 70 crores. The whole of it has gone into hoards; and I presume the habit is certainly not decreasing very much.

2790. Then let me put to you another question. Over 70 per cent. of the people are cultivators, 70 per cent. of the Indian population?—Certainly.

2791. And they have within the last few years since the War been living from hand to mouth?—I take it that is so.

2792. Most of them have only two meals a day?—I would not say most of them; some of them.

2793. Very goed, but they are very hard up. For the last few years, time has been very hard for them. Do you think they can now afford to hoard to anything like the extent they used to do when they had prosperous times?—I do not believe that the cultivators are worse off than before. They are poor; their standard of living ought to be raised and that will depend upon the economic development of the country, but their capacity for hoarding has not decreased during the last few years of the War and since the War there has been no appreciable deterioration in their economic condition.

2794. There is another question I should like to ask you on this heading: They hoard these coins to meet their necessities during the time of famine or other contingencies, is it not?—And also for social and religious purposes.

2795. Therefore do you think those people who hoard a small amount of coin would be inclined to change their silver into gold or that they will keep the silver in order to facilitate their expending the money as and when they like to do so?—I do believe that the establishment of a gold standard would not lead to a great demand for gold for conversion.

2796. (*Professor Coyajee.*) Assuming that the introduction of a gold standard was simultaneous with the rupee being deprived of full legal tender, in that case the demand for conversion of rupees into gold would be very large?—It would be considerably greater than it would otherwise be.

2797. And perhaps some of the notes might come forward for being converted?—About that I am not in a position to express any definite opinion. I should think that there is no reason why the number of notes which are likely to be converted into gold will be increased.

2798. I will tell you why: I will make a suggestion. Suppose silver was being thus demonetised; the owners of silver ornaments would also like to exchange them for gold and the instrumentality for such conversion would be to sell the silver for notes or rupees and present them for being exchanged into gold?—We have got to assume that the demonetisation of silver rupees will lead to a demand on the part of the cultivators to convert their ornaments into gold. The value of these ornaments is not very large and they are required for social and religious purposes and I believe that there will be no general or widespread desire to convert their ornaments into gold.

2799. Don't you think the demonetisation of the rupee and the sale of a portion of the rupee would lead to a fall in the price of silver and to the expectation of a still greater fall, and will not that induce the owners of silver ornaments or hoards to try and sell as soon as possible?—It is very difficult to say how the masses are going to behave, because the considerations of what we call the crowd mind have got to be taken into account; and as you know the working of the crowd mind is very tricky and inexplicable; but all the same, if there is a general belief that the price of silver is going to fall, then there might be a considerably large amount of conversion of ornaments into gold; but as the process of introduction of the gold standard will take time, I do not think that there will be a sudden and general depreciation in the price of silver.

2800. (*Sir Maneckji Dadabhoy.*) This process of hoarding has been going on in this country practically, we may say, for centuries?—Since time immemorial.

2801. And this hoarding, as I understand, is partly in gold and partly in silver: when it takes the shape of gold it is a sort of investment in ornaments, is it not?—Generally.

2802. And not for the purpose of laying by for a bad season or anything like that?—People do convert their ornaments into money if they have bad times.

2803. But otherwise they always keep a certain amount in silver for the purpose of immediate requirements, is it not, against bad harvest and bad times?—Do you mean to say silver coins?

2804. Yes?—They do keep a certain amount of money in silver coins.

2805. And this appetite for hoarding gold is now in a great measure satisfied by private imports?—That it is.

2806. Then do you think that the introduction of a gold standard will in any way accelerate the hoarding any further?—I definitely do not. I have said that much in the memorandum.

2807. And silver will still continue to form a part of the hoardings?—To a certain extent; but as the people grow richer they will take more to gold and leave silver.

2808. And that will be a very slow and gradual process?—Yes, since the economic development is going to be slow.

2809. And it will not interfere with the introduction of the gold standard?—It should not.

2810. (*Chairman.*) It is not quite clear to the witness whether your questions proceed upon the basis of a previous limitation of the legal tender of the rupee or no such limitation.

2811. (*Sir Maneckji Dadabhoy.*) I think, Sir, the witness made it clear in his answers to you that he did put a limit on the legal tender of the rupee.

2812. (*Chairman*). I am not quite clear whether he was answering them on the basis of a limited legal tender of the rupee or not. Which were you assuming in your answer?—If there is unlimited legal rupee tender, then there will be no increase in the demand for gold for hoarding on account of the establishment of a gold standard. But if the rupee is made limited legal tender there will be to a certain extent—to what extent I cannot say—an increase in the demand for gold; but it will not be so very heavy as to make the establishment of a gold standard an impossibility in this country.

2813. (*Sir Maneckji Dadabhoy.*) One little further information: in discussing the gold standard and the gold exchange standard, you say in paragraph 2 that the gold exchange standard has been thoroughly discredited by events and then you go on to discuss that question. I would like to know whether this gold standard has failed on account of its intrinsic imperfections or because it has been badly and incorrectly managed?

2814. (*Chairman.*) Might we keep that question for just a little later period in the examination, because I think it would come more easily to the witness to answer it a little later?

2815. (*Sir Henry Strakosch.*) I should like to ask the Professor why he considers that the introduction of the gold standard with gold in circulation in this country would make it easier to maintain the exchange value of the rupee?—My position is just this, that if people believed that a gold standard has been established in the country the banking development of the country will take place on that basis, that is a country is on a gold basis and rupees and currency notes can be converted into gold. Now, as in other countries, banks are doing a great deal of the exchange business and can to a certain extent help in the maintenance of a rate of exchange, here also the banks will be able to perform that function, knowing that the country is on a gold basis.

2816. But would you regard gold in circulation in the pockets of the people as a valuable reserve to stabilise the external value of the rupee?—That I would not; but I should think that gold in the bank

reserve and the currency reserve will certainly be utilised for supporting exchange.

2817. I see. You also mentioned that you do not expect a large amount of gold to enter into active circulation?—Yes, into active circulation.

2818. Therefore, you are relying on the banking reserves and currency reserves for the maintenance of the exchange value of the rupee under the gold standard system with gold in circulation?—Yes, to a certain extent on banking reserves but also, as I point out later on, upon investing a portion of the currency reserve.

2819. To what extent does that differ from a gold exchange standard system in regard to the maintenance of exchange at gold par?—For the present we depend only upon the gold standard reserve and the currency reserve. Then we will have gold in the banking reserve of the country here, and that can supplement to a certain extent the process of maintenance.

2820. Would you say it is wrong that the amount of reserves in the currency reserve and in the banking reserve would have to be smaller under an effective gold standard with gold in circulation as compared with a gold exchange standard?—May I request you to repeat that question?

2821. Would you regard the amount of gold reserves held for currency and banking purposes under the gold standard would be smaller than under the gold exchange standard?—As I believe that under the gold standard the amount of gold in circulation will not be very large, the establishment of a gold standard will not affect the amount of gold in the currency and banking reserves to any appreciable extent.

2822. You said that you would be advocating a gold standard with gold in circulation provided it does not cause damage to India's economic life?—It would not cause any damage, but people will not be prepared to use it as it is unsuitable for every-day life.

2823. Perhaps I ought to explain more clearly what I meant. You say that you would be advocating a gold standard if the introduction of the gold standard does not produce reactions on India which may be detrimental to the country. I have in mind this, that the introduction of a large amount of gold from the stock of gold money which exists in the world might possibly have an influence on prices which would naturally and automatically react upon prices in India. Have you thought what the reactions might be?—Do I understand you aright when I say that you want me to tell you whether the introduction of a gold standard will dislocate the economic life of the country to an appreciable extent?

2824. Yes?—When the time is ripe for it I do not anticipate any serious inconvenience.

2825. You do not therefore believe that the diversion of a very substantial amount of gold from the stock of gold money in the world will have any effect upon prices?—Diversion from the use in other countries to use in India, that is what you mean?

2826. Yes?—The influx of gold into India on account of the establishment of a gold standard will not increase very much and therefore the world need not be afraid of India upsetting their economic life on account of the establishment of a gold standard; but even if it does cause a certain amount of inconvenience and appreciation of money on account of the increased demand for gold I would not postpone the establishment of gold standard in this country on account of a possible appreciation of money in the countries of the world.

2827. But may I put this to you? You said that you would advocate the introduction of the gold standard when there was accumulated sufficient gold to cover the rupee circulation and note circulation by 50 per cent. and that you had taken the rupee circulation to be 200 crores which would not include any gold that might go into hoards in substitution for silver for the present silver hoards. The total amount of gold called for under your system merely to cover 50 per cent. of the rupees and notes would, I reckon, be in the neighbourhood of 180 crores?—Yes, that is the amount.

2828. To which has to be added the amount that might conceivably go into the hoards in replacement of silver?—Well, as I have made it quite clear already, I don't expect much to go into hoards on account of the establishment of the gold standard.

2829. Would you say that 20 crores might conceivably go into hoards?—We can take that amount, just for supposition.

2830. Then we have a total requirement of gold for this country, the main portion of which would not be available, I take it, for currency purposes in the proper sense, of 200 crores. How much gold have we now available?—We have got about 22 crores I believe in the paper currency reserve, havn't we? Then as regards the process of introduction of the gold standard into India, I mean, we need not introduce the gold standard at once. We can gradually convert our securities into gold and if we want to, we can also convert our silver rupees into gold and thereby accumulate a stock of gold without causing serious inconvenience to the gold market of the world.

2831. But it is true to say that if we did introduce the gold standard to-day, the requirements would be 200 crores, less 22 crores?—Yes, about 180 crores.

2832. Roughly 180 crores. You don't think that the withdrawal of 180 crores, even if spread over a period of, say, five years, would have any appreciable effect upon the gold price?—There is a lot of gold lying in America which she could easily get rid of to her benefit and to the benefit of the world. Well, we could get hold of that gold, we can establish the gold standard, and the world won't be the worse off on that account.

2833. (*Mr. Preston.*) I think some few moments ago in reply to a question from the Chairman, you stated that some years ago Government allowed gold to go out in return for notes and silver sent in and you said that that gold shortly afterwards returned to currency. Is that a fact?—Yes, that is a fact.

2834. Now, as illustrating my point, I would just like to ask you this question. During the crisis (I am now quoting official figures)—during the crisis of 1907-8 while £4,179,000 in gold was withdrawn by the public from the paper currency reserve, only £250,000 was exported on private account, and the balance all went into hoards. Would that alter your reply to the Chairman?—I do not catch your point. May I request you to put it again.

2835. I will repeat it perhaps in a simpler form. You said, some years ago gold was applied for from the paper currency reserve, was given out, the takers of the gold had no use for it and returned it back to the paper currency?—Yes. That is a fact.

2836. I am now quoting from an official document?—I suppose from the Chamberlain Commission's Report.

2837. Yes, this is from the Report of the Commission. This fact is borne out by the official records. "During the crisis of 1907-8 (that was the American crisis—and this was done under, I think I am correct in saying, a sort of compulsion almost, at any rate, pressure) while £4,179,000 in gold was withdrawn in India by the public from the paper currency reserve, only £250,000 of that amount was exported on private account and the balance was all sent into hoards." Will that alter your first reply?—Do I take you to mean that you want me to tell you whether, if people have got gold, they will make it available for international payment?

2838. No; you said at first, briefly, that gold was taken out, that it was found not to be wanted and was sent back. This document says that 4 million pounds was taken out and vanished?—Yes, it did go into hoards.

2839. (*Sir Reginald Mant.*) Professor, I understood you to say in reply to the Chairman that you didn't

think there is or will be any general desire on the part of the people who have hoards of silver to convert those hoards into gold?—Yes, the desire should not increase on account of the establishment of the gold standard.

2840. But didn't you say there is not any great desire at present? Do you think there is at present a tendency to exchange the silver hoards into gold?—Well, they are keeping as much gold as they can or want to in hoards and the amount of silver rupees that are in hoards are likely to remain in hoards even if you establish the gold standard.

2841. Then the people are not at present changing their silver rupees into gold? Is that your position?—The amount of gold that we are importing shows that to a certain extent that is being done.

2842. That is what I want to elucidate?—What I mean is that the people can, even if you do not establish the gold standard, they can continue to convert their silver rupees into gold without limitation and there is no reason why the establishment of the gold standard should make them more eager to do so.

2843. Quite so. I see that point. But what I wanted to clear up is whether you think that people are at present converting their silver hoards into gold. You referred to the very large imports of gold last year, somewhere in the neighbourhood of 73 crores, and you said that that gold went into hoards. Now I ask you whether you think that was in addition to the previous hoards or whether it was to a large extent in substitution for silver?—Well, it is very difficult to make a definite statement on that point. But my own belief is that the increased demand for gold is due to good harvests and the cheapness of gold. Gold is comparatively cheaper, and people are demanding gold not because they want their silver hoards in gold but because they want to put by money in that form.

2844. But do you think they could put by in one year an additional amount of 73 crores?—The entire amount is not additional. We had been importing a considerable amount before. Our pre-war average was 31 crores. Now this 40 crores, with good harvests and a decreased demand for imports, is not a very large figure to put by out of annual savings.

2845. You think then that the aggregate amount of hoards last year was increased by 40 crores of rupees?—Well, I take these three factors into account; the first is a good harvest, the second is a decreased demand for imports and the third is the cheapness of gold. Taking all these three things together, I do think that the additional gold which has been imported is due to annual savings and not due to the conversion of silver rupees into gold. To a certain extent silver rupees may have been converted into gold, but generally speaking, I should say, it is out of the annual income that this gold has been purchased.

2846. (*Sir Purshotamdas Thakurdas.*) Professor Gyan Chand, you refer to the rather phenomenal figure of 73 crores of gold imported last year and you thereby indicate that the tendency to hoard has not decreased. Don't you think that it would be more correct, in order to arrive at a conclusion, to strike an average for 5 or 10 years? Would you go only by the figure of one year to find out whether the habit has been on the increase or whether it is only a bringing up of the average after the deficit that may have prevailed in previous years?—I would take the average as the better index.

2847. You would, wouldn't you? Now you yourself said that the pre-war figure for imports of gold was about 31 crores?—Yes, it was that amount.

2848. If with this figure of 73 crores from the year 1914-15 to the year 1924-25, the average per year should work out to 16 crores, what would you say? I mean would you not say that the 73 crores should not be looked upon as a phenomenal figure but should be looked upon as a figure which helps to make up the vacuum which existed in India of the gold requirements of the people for ornaments or for hoards, and that the 73 crores figure should not be made much of?—I would not make much of it, but at the same time I would say that the fact that out of the income of the people they are prepared to invest 73 crores in a year shows that they are still addicted to gold, that they want to get hold of as much gold as they can.

2849. Now they are only making up to the average, whether it is out of the currency or out of what they didn't buy in past years—but you will admit that, with this figure of 73 crores of last year, India has not taken more than what she took before the war?—On the average she has not.

2850. If the pre-war years show an average of 31 crores or 28·82 as the official figure has it and if with this figure of 73 crores the average for 10 years, works out to 16 crores, would you say that she has taken more?—No, I would not say that.

2851. Regarding the question of the total requirements of India for gold a certain proportion of the quantity which is imported must be used for genuine requirements such as ornaments, just like people in any other part of the world do?—Yes, a very large proportion is used for ornaments.

2851A. Would you mind saying what is the proportion which should be allowed for genuine requirements such as ornaments, etc., and what percentage should be looked upon as the amount for hoards?—It will be merely guess work, but I will say 50 per cent.

2852. Half and half?—At least.

2853. If the total quantity of gold taken on an average by India before the war works out to India's genuine proportion of the total production of gold in the world compared with the population of the world, namely, India's population as one-fifth and she takes one-fifth of the total gold production, do you think that any part of the world has any right to complain?—No part of the world has any right to complain that India chooses to take gold. It is our own concern.

2854. Excuse me. That is another point. Going on proportions and going on the share due to India as forming one-fifth of the total population of the world, would not India be entitled to one-fifth of the total production of gold if she took only that?—I would not go on the population basis. I would take the real purchasing power of the country, and that is not one-fifth of the total purchasing power of the world.

2855. Then what would you go on that would enable us to come to the excess that you think India takes?—Well, I will have to take an economic survey of the whole world.

2856. Have you struck upon any figure like that?—It is very difficult. We don't know how much India produces, not to say the world.

2857. But if you went on a population basis and if India took her share of the total production, then taking that basis to be granted for argument's sake, India does not look like being the sink of the gold in the world?—That she does not. But as I have pointed out, the population basis is not the correct basis.

2858. Until we find out some other basis, we cannot arrive at data?—No.

2859. (*Sir Alexander Murray.*) You were answering Sir Purshotamdas just on the assumption that his figures were correct?—Yes.

2860. And if they are not correct, that would probably alter your conclusion?—But there is not the slightest doubt about it that India did not get her due share during the war and the fact remains that part of the demand is due to the deficiency during the last few years.

2861. (*Sir Purshotamdas Thakurdas.*) May I, Sir, on this point, give my figures to Professor Gyan Chand and ask him to confirm them?

2862. (*Chairman.*) These are the figures of the import of gold on private account. What would the

question to Professor Gyan Chand be? He, of course, cannot tell us whether he considers the official figures have been accurately based or are inaccurate.

2863. (*Sir Purshotamdas Thakurdas.*) No, but whether the rough calculation which I have given is inaccurate or not?

2864. (*Chairman.*) Certainly, if you will give him the calculation.

2865. (*Sir Alexander Murray.*) I think Sir Purshotamdas is quoting imports on private account only and he has overlooked the fact that there were Government imports which were actually put into circulation. The actual consumption does not compare with these figures that have been given at all.

2866. (*Sir Purshotamdas Thakurdas.*) I am quite prepared to let Professor Gyan Chand add any supplementary figures that Sir Alexander Murray may be pleased to give.

2867. (*Chairman.*) One moment. Is not this a matter which we could really clear up best amongst ourselves, or do you think Professor Gyan Chand has special knowledge?

2868. (*Sir Purshotamdas Thakurdas.*) I submit, Sir, that if this is a matter which we should not discuss here, Sir Alexander Murray should not have put the question he did whether the witness's conclusion would vary in proportion to the correctness of my figures, and I think it is due to me and to Professor Gyan Chand that the point should be cleared up. What I said is always subject to correction by Sir Alexander Murray.

2869. (*Chairman.*) Let us put the figures to Professor Gyan Chand and see what he says.

2870. (*Sir Purshotamdas Thakurdas.*) If you will oblige me by taking the figures down—

Imports of gold in—

	Lakhs.
1924-25	73,78
1923-24	29,19
1922-23	41,18
1921-22	—2,79
1920-21	—8,88
1919-20	10,97
1918-19	2,00
1917-18	21,46
1916-17	4,20
1915-16	4,90
1914-15	8,45

—I am not very good at figures, so some allowance must be made for mistakes. I think it works out to 17 crores.

2871. (*Sir Purshotamdas Thakurdas.*) Did I not say 16 crores. Sir Alexander will now supplement the above with figures for imports on Government account.

2872. (*Sir Alexander Murray.*) All I wish to point out to Sir Purshotamdas is that the figures he is giving are the figures of private imports and they do not include the Government imports much of which were actually put into circulation by Government by these sales and by the minting of gold mohurs,—that is by the sales of gold made by Government, gold coin, sovereigns and also gold mohurs. And as a matter of fact, if you will turn to Appendix III (you have been quoting from Appendix II to the historical memorandum) you will see that the figures cannot possibly be complete because, taking the year 1918-19 you say that there were only on private account imported 2 lakhs of gold coin and bullion, but as a matter of fact in 1918-19 there were Rs. 521 lakhs absorbed in sovereigns and half-sovereigns alone. And in addition to that, there were 60 lakhs of gold mohurs taken. Then, if you come down to the years 1921-22, you say that there was actually net exports of gold coin and bullion, but if you look at the corresponding figures for the total absorption you will find that there were 278 lakhs in 1921-22 and 943 lakhs in 1922-23 taken in the form of gold coin alone.

2873. (*Sir Purshotamdas Thakurdas.*) Quite correct. But I thought that you were now giving your figures to complete the statement. That is what I expect that you are going to do. Now, we will add and supplement the figures in Appendix III, and let us see whether the figures that I gave Professor Gyan Chand were misleading or not?

2874. (*Chairman.*) I think we must confine our questions to such a form as can be put to the witness. Sir Purshotamdas, can you put any further elucidatory question on the point with which you have been dealing in a form in which the witness can enlighten us; and then possibly if Sir Alexander Murray has any further elucidatory question he will put it in the same form.

2875. (*Sir Purshotamdas Thakurdas.*) Professor Gyan Chand, Sir Alexander Murray has expressed a doubt regarding the figures I have given. Do the figures I gave appear to you to work out to 16 crores as the average consumption of gold by India for the years mentioned?—Well, any other figures that might have been added would not have raised the amount above 20 crores, and the point will remain that India has been starved during the war years and that she is trying to make up the deficiency now.

2876. Therefore if any supplement is to be given, it is to be given by any person who wishes to bring the aggregate up?—But that won't affect the validity of the point.

2877. That is clear as far as I am concerned. The total net import of gold coin and bullion during the period 1914-15 to 1924-25 is given as under in official papers put before the Commission:—

Private account	Rs.	182,48 lakhs.	
Government account (1924-25 figures being for 11 months).	,,	43,57 ,,	
Total	,,	226,05	for eleven years.
Average per year	,,	20,55 lakhs.	

2878. (*Sir Norcot Warren.*) With regard to these hidden hoards of coin and ornaments, what proportion would you say was held by the sowcars and the chetti community as securities for loans given to the people?—It is really very difficult to answer that question.

2879. Would you say a third?—I would not hazard any guess.

2880. Would you agree it is a third?—I would not say anything on the point.

2881. Is it not a considerable amount?—You see it is very difficult to be positive on that point because it requires careful investigation of the actual conditions. The amount held by the depressed classes from the chetti community is really incalculable under present circumstances.

2882. (*Chairman.*) Now I am going on to another aspect. Should I be fair in summarising your introductory analysis as to the working of the pre-war exchange standard and your comments upon criticisms made upon that standard in the phrase that, in your opinion, before the war the exchange standard system was not given a fair chance, and that such adverse circumstances as occurred were due rather to a misunderstanding or unskilful use of the exchange standard than to any inherent defects in the system itself?—I would not question the efficiency of the Government of India, but what I would say is that they drifted into a position the full consequences of which they failed to understand, and therefore one cannot condemn the exchange standard merely because on two occasions—in 1907 and then again in 1914—they allowed the rate of exchange to fall below the gold point. They did not quite understand what the gold exchange standard meant. It was the Babington-Smith Committee that recommended that Government should sell reverse councils without any limit. If you have effective gold exchange standard there need be no doubt on that point that the Government is prepared to sell reverse council bills to meet the requirements of trade, and there should be no limit on the amount.

2883. Nevertheless, as I follow out the reasoning of your memorandum, I find, do I not, that you do not recommend any effort to re-establish now an improved exchange standard?—I have two reasons for it.

2884. That is the proper interpretation of your recommendation, is it not? You do not recommend the introduction of an exchange standard, even an improved exchange standard?—Unless we can have some measure of international co-operation.

2885. What is your reason for that?—In the first place, it is very difficult to choose the rate for the time being at which the rupee can be stabilised. In the second place, the world prices are fluctuating, and if the exchange standard is to work well, the prices should be stable on both sides—comparatively stable in India and comparatively stable in the other countries of the world. Well, I do not see any likelihood of prices becoming stable for a long time to come, and therefore I am not in favour of an exchange standard being established in this country.

2886. Do you think it will ever be possible to achieve stability of prices?—Not absolute stability of prices, but comparative stability of prices should certainly be attainable; and if the world knows its own interests, it ought to take measures to stabilise prices as soon as possible.

2887. Do you see any features in the present situation such as would lead you to expect in the foreseeable future any sharp change in price levels?—In the first place we have got to take into account the possibility of a cheap money campaign in America. America is liable to these fits, and one does not know whethor the Federal Reserve Board will not submit to political pressure and we may then have a cheap money campaign in that country. Then we should take into account the fact that France has got to stabilise her currency system yet, and Italy has got to do it. In Sweden prices are very high, in Japan prices are very high, and England is the only country and also the United States which have fairly stable prices, and one does not know what is going to happen there. In America, certainly, one does not know, and in England also high prices would not be absolutely inconceivable; and, therefore, for the time being I cannot anticipate a stable level of prices in the different countries of the world.

2888. You refer to the possibility of a cheap money campaign in America. We know, do we not, that any country can always inflate at any time if it pleases?—Yes. I understood you to ask me whether there is likely to be any sharp rise or fall in prices in the near future?

2889. Recognising that any country can inflate at any time that it pleases, what leads you to expect a greater danger of a sharp inflation in America at the present time than the normal danger that you always have?—Well, the conditions are abnormal, and therefore a normal danger becomes abnormal under abnormal conditions.

2890. What is there abnormal in the present conditions in America which might make it more probable that we shall see an inflation?—The accumulation of a great stock of gold is immense. The Federal Reserve Board has been practically sitting upon gold all these years, and if she thinks it worth while to change its policy there will be a very great inflation in America and a sympathetic increase in prices in other countries of the world.

2891. But if you want to inflate, you can inflate whatever your stock of gold is, can you not?—But the possession of a large stock of gold is a great temptation. The likelihood is greater when there is a very great quantity of stock.

2892. Let me put this view to you just to see whether it makes any difference to your opinion. A large stock of gold, it might be said, may force a certain measure of inflation until you have learnt how to control it, or, in popular words, to sterilise it, but once you have learnt how to sterilise a large stock of gold and to maintain your prices stable in spite of your stock being abnormally big, why should there be any temptation to inflate in the mere possession of a stock?—The world has not learnt to sterilise gold yet. That is what I would say in answer.

2893. Let me ask you a final question just to test that. If the world at large has not learnt to do so, has not the experience of the last two or three years shown that the financial and monetary authorities of the United States have learnt how to do so?—In the last report of the Federal Reserve Board they definitely disavow any intention of bottling up gold in order to stabilise prices, and they make a definite statement that the present state of knowledge—I mean they say we do not know enough to indicate anything as to their action. That is their definite opinion which they express in the last report of the Federal Reserve Board.

2894. I understand you to feel apprehensions about the stability of sterling currency?—I do not feel any apprehension regarding the depreciation of sterling in terms of gold, but there is a possibility of a general depreciation of sterling, though I would not say likelihood—a general depreciation in terms of commodities, a rise of prices in England.

2895. What leads you to foresee that? I acknowledge the great difficulty of foreseeing such a movement, but what are the factors in your mind?—One factor in my mind is that the upward movement has begun. The trade has turned a particular point and now we are going to have an upward movement of prices. For a long number of years, from 1920, I should think, to 1924 prices have been falling, and if the trade cycles mean anything, the prices should rise in the next four or five years, and the experience of a large number of years shows that that is inevitable—unless the Bank of England listens to Professor Keynes and adjusts its discount policy with a view to stabilise prices.

2896. Do you see any reason to suppose that the circumstances to which you refer, such as might cause a rise, are not world-wide?—By circumstances you mean the abnormal movement of prices?

2897. Yes, why should it be local in sterling-using countries rather than world-wide?—That would strengthon my point that prices are not likely to be stable for some time to come.

2898. Is it your opinion that it is likely to be local in sterling-using countries, or is it rather your opinion that the rise to which you refer is likely to be world-wide?—The rise may be very widespread, but the extent of the rise will be different in different countries owing to the different currency policies pursued by the authorities.

2899. And those conditions to which you refer are, in your opinion, likely to be more sharp, or more sudden, or more extreme than those fluctuations which are the normal state of the world at any time, however normal?—Well, there is a very close connection between the economic life and the currency system of a country, and as I am not quite sure whether the economic life of peoples is going to be stable in the next few years, there is a possibility of the fluctuations of prices being wider than they otherwise would be.

2900. I would like to ask whether you have in mind any other factors of economic instability than those to which you have already referred?—In the first place, you are having a great deal of economic or labour discontent in various countries of the world. The export and import trade has not settled down to its normal level. The conditions of reciprocal demand are quite uncertain; and therefore, apart from the fact that prices are likely to rise on account of trade cycles, the economic conditions of the world make the possibility of stabilisation more extreme, more unlikely.

2901. And for these reasons you are of opinion that the time has not come to attempt to fix a stabilised ratio for the rupee?—Of any currency, as a matter

of fact, unless a country has got a large stock of gold like America.

2902. To complete the picture, I think that, in the course of your memorandum, you express an opinion as to the selection of a higher rate than the one at present current or a lower rate than the rate at present current; you express an opinion as to what rates would be the best rates to choose, supposing that you were fixing them?—Unless I have expressed myself very inadequately, I do not mean to suggest any rate, high or low.

2903. I quite understand that you are against the adoption of any rate at the present time, but this is the sentence which I had in mind: "The arguments set forth in the foregoing paragraph (paragraph 11) only lead to a negative conclusion, that there is no necessity or obligation of adopting the 1s. 4d. ratio as the basis of our currency system." Your view there is quite consistent, but I understand that your arguments on the subject of this rate or that rate, 1s. 4d. or 1s. 6d., are directed only to showing that there is no obligation to establish one rate rather than another when you come to the time at which this rate can finally be established?—The point which I am driving at is this. Suppose that we have got to choose between 1s. 6d. and 1s. 4d. I want to point out that neither the one nor the other is a suitable rate for adopting just now. There are no reasons why the 1s. 4d. rate should be adopted, but on the same ground there is no reason why the 1s. 6d. rate should be adopted Both are equally unsuitable from that point of view.

2904. Your argument develops itself towards destroying the case for the immediate establishment of any rate, whether 1s. 4d. or 1s. 6d. or anything else?—That is the object which I have in view.

2905. (*Sir Henry Strakosch.*) You said that you would not advocate the adoption of a gold exchange standard until such time as international co-operation has been established?—Certain measures of international co-operation.

2906. I wanted to ask you what measures of international co-operation you have in mind?—A firm determination on the part of the various authorities to limit the fluctuations of prices and to support exchange by converting the currency of one country into the currency of another country through the instrumentality of a regulatory authority.

2907. An international authority or a national authority?—The international authority will have to take charge of the stock of gold. The gold will be probably deposited with the international authority, certain international authorities as recommended by the Genoa Conference. But the conversion of one currency into another currency can be brought about by the regulatory authorities in the countries concerned.

2908. But would you not think that a condition precedent to such international agreement is that the countries desiring to adhere to an international agreement should have adopted a gold or gold exchange standard?—Well, they should have adopted the currency which is fairly stable and establish conditions favourable for the establishment of a stable standard. But I should not say that they should adopt a gold exchange standard or a gold standard.

2909. Which standard do you regard as the one most likely to lead to stability, a managed standard or one that is hitched to gold?—I am in favour of the regulation of the currency system.

2910. By management?—By a regulatory authority.

2911. And that is not to be based upon gold at all?—If we have international co-operation, we can certainly do away with gold.

2912. But do you think it is a practical proposition to contemplate an international agreement on the basis of a managed currency system, when a very large proportion of the civilised world has already been or is in the process of adopting the gold or gold exchange standard?—The civilised world still does not seem to have made up its mind. England and America have adopted gold standard, but there are other countries which have still to find a level as far as their currency system is concerned. All the same, I would express this opinion, that international co-operation will be facilitated if each country has got a stable standard, a standard which is likely to inspire national confidence. But as the question is not of very practical importance, I do not think it is worth while pursuing it further.

2913. But, Professor, you said that a condition precedent would be the introduction of a standard in a great number of countries which inspires confidence. I may take it that you will agree that the world opinion to-day is in favour of a standard which is hitched to gold in one form or another? It has not reached the stage where it would prefer a purely managed currency. If that is so, do not you think that the wider the area over which the gold standard is introduced, the easier it will be to bring about international co-operation in the sense of the Genoa resolutions?—The introduction of a gold standard certainly will make matters easier.

2914. Yes, and you are aware that during the last few years quite a number of countries which have had very disorganised currency systems have finally succeeded in stabilising their currencies on gold? I am referring to Germany, Austria, Hungary and some other countries?—Yes.

2915. If every one of those countries had taken up the attitude that you suggest, of waiting until an international agreement had been reached, when do you think the world would reach stability?—India is not in the same position as Germany and Austria. Conditions were peculiar there and things had got to be done in a particular way, while India is fairly well off and can afford to wait.

2916. But would you not admit that if India by a heroic step were to say "I will adhere to a gold or exchange standard" and by that process widen the area which embraces the gold standard, you would be helping forward an international agreement very materially?—The prospect of an international agreement is so very remote and I do not think it is worth while to risk anything of that kind.

2917. But would you not say in view of the fact that the world has very largely adopted some form of gold standard, that it is worth while, in order to impart greater stability to prices, to run the risk and also embrace that standard?—And possibly take a very rash step.

2918. You regard it as a rash step?—Possibly; I do not say certainly. But in the selection of rate we are likely to commit serious mistakes.

2919. May I infer from that that you think it far safer for India to adopt a managed currency system? Do you prefer that to the adoption of a system hitched to gold?—The system that I recommend will not be managed in the same way in which the gold exchange standard was managed. There will be free expansion of currency. The paper currency will be circulated in the same way as it now circulated. Exchange will take care of itself and there will be no element of greater instability on account of waiting upon events.

2920. But you do not suggest that the standard should be one which is linked with gold?—Just now, immediately.

2921. Your end and aim would be a gold standard?—Yes, gold standard.

2922. But would you make it a condition that the gold standard should not be adopted in India until an international agreement has been reached?—That I would not. I will not insist on international agreement for the establishment of gold standard but I will insist on it for the establishment of gold exchange standard.

2923. I do not quite see the difference; why should you wish to wait in the one case and not in the other?—A successful working of gold exchange standard requires stabilisation in different countries

of the world and as the stabilisation is not likely to be achieved without international agreement, gold exchange standard should not be introduced in this country unless we have got some measure of international agreement.

2924. Have you in mind the fluctuation in the gold prices of the world?—Fluctuations in the gold prices certainly.

2925. I cannot quite see the difference between the gold standard and the gold exchange standard. How will the gold standard free you from the influence of fluctuations in gold prices and not the gold exchange standard?—Gold standard will not free us from the fluctuations in prices; but gold standard does not require that measure of stabilisation which gold exchange standard does.

2926. May I ask what are you afraid of? Are you afraid of the fluctuation in gold prices or what else are you afraid of?—I am afraid of the recurrence of what happened during the war. Our rate of exchange was fixed, sterling prices were rising, our prices had got to rise because sterling prices were rising and we had to inflate our currency on account of an inflation in England.

2927. If you adopted a gold standard you would not be free from that danger?—But our rate of exchange will rise. The currencies of other countries will depreciate in terms of gold. But if we establish exchange standard, we will be keeping our rate of exchange fixed in spite of the fact that the prices were rising.

2928. I am very sorry but I cannot follow the argument, that in one case you would be free from the influence of the movement of world gold prices and in the other you would not?—If you have got gold standard our rate of exchange with the different countries of the world will not be fixed, if other countries are inflating their currency. Their currency will depreciate in terms of our currency. But under gold exchange standard we will have to keep a fixed rate of exchange in spite of the fact that there is unstability elsewhere.

2929. But would you not have to have a fixed rate of exchange if India adopted a gold standard in relation to other gold standard countries?—Fixed rate between gold and gold, but not between gold and other currencies of the world.

2930. (*Chairman.*) I am not quite sure that the Professor by saying gold exchange standard does not mean sterling exchange standard?—I mean gold exchange standard. I take it that gold and sterling are going to be interconvertible in the future and therefore whether we have gold exchange standard or sterling exchange standard, there would not be any difference. But the point is that those currencies of countries in which prices are moving violently will have a fixed rate of exchange with India on account of the establishment of exchange standard.

2931. (*Sir Henry Strakosch.*) I don't see that after all we have to deal with world gold prices. If India adopted a gold standard with a gold circulation, India's prices would naturally have to follow world gold prices?—Certainly.

2932. And therefore India would be subject to the fluctuations to which gold prices are subject in the world?—You see very well that if we have got gold exchange standard, if India has got a favourable balance of trade, gold does not flow into this country and therefore other countries do not feel the pressure of unfavourable balance of trade which they would feel if India had a gold standard and gold had to flow into the country instead of remaining outside.

2933. In which case you would be accumulating reserves in the form of gold abroad?—Gold abroad, keep our gold in foreign countries.

2934. Or if you like, in India?—If you are prepared to import gold and bring about an inward movement, I think the result will almost be the same. But if you are going to keep gold elsewhere——

2935. I do not suggest that?—Or invest the gold in foreign countries in the way in which we have been doing during the last few years, then a favourable balance of trade will not effect monetary systems of other countries on account of influx of gold into this country.

2936. (*Sir Maneckji Dadabhoy.*) You stated that at present you are not inclined to fix exchange either at 1s. 4d., or at 1s. 6d. I understand that this is due to the fact that in either case it would be merely a speculative adjustment in view of the present conditions. Is that your idea?—Yes; it will be more or less guesswork, I mean the selection of the rate.

2937. The selection of the rate would be more or less guesswork and it would be an artificial adjustment without anything to back it up, without any proper foundation?—Yes.

2938. Then will not this state of things continue as long as the prices in India and elsewhere are constantly changing?—I am not thinking of the prices. I am thinking of the economic conditions of the world being in a state of flux; and as long as the conditions continue, certainly the choosing of the rate will be a difficult affair.

2939. But would it be right to postpone the determination of the rate in India because the world economic conditions are not certain?—When you have got to bring about a nice adjustment with constantly changing conditions, it is desirable to have a fluctuating rate of exchange rather than a fixed rate of exchange because that enables you to adjust your conditions more rapidly to the world conditions.

2940. You prefer, during the period of economic world disturbances, that the conditions should fluctuate instead of being stabilised?—The rate of exchange should fluctuate in order that economic conditions in India may be adjusted to the world conditions.

2941. Would it eventually profit India?—It would eventually profit India because it will enable her to steer her course with a certain amount of intelligence. If she fixes the rate of exchange, she does not know where she stands.

2942. Can you anticipate any fall or revival in trade with fluctuating exchange?—I do not anticipate any continuance of the depression in exchange.

2943. I would like you to give me a positive reply and not a negative reply; would it inspire confidence in trade with a fluctuation?—If other conditions are favourable, the fluctuating rate of exchange will not matter.

2944. What are those other conditions?—The other conditions are, good production inside the country and good demand outside the country, or an increase in the real purchasing power in India and a large demand for Indian goods elsewhere.

2945. Large demands for Indian goods?—Yes.

2946. You were speaking of international agreement. Is it within the range of practical politics to have such an international agreement?—It is because that it is not within the range of practical politics that I reject the gold exchange standard.

2947. And unless that is possible you are against the recommendation of the exchange standard?—I would qualify that statement by saying that I believe an international agreement is not possible and therefore the gold exchange standard should not be introduced in this country.

2948. And therefore we should work up gradually to a gold standard?—Yes, that is definitely my opinion.

2949. (*Sir Purshotamdas Thakurdas.*) I understand that the state of international conditions which might have inspired confidence in Great Britain to return to the pre-war ratio does not commend itself to you, nor does it inspire any confidence in you as far as the fixing of an Indian rate of exchange is concerned?—I do not see any reason why 1s. 4d. should be selected.

2950. Excuse me, I am not talking now of 1s. 6d., or 1s. 4d., or any rate at all but the fact of

stabilisation. The rupee you recommend should not be stabilised because of world conditions. Now Great Britain has come to the gold point and you do not think that Great Britain could have taken adequate notice of international conditions and world conditions before she made up her mind?—Great Britain was in a position to do so; but when I speak of the conditions being unsuitable I am not only talking of the currency system, as I made it quite clear, but I am talking of economic conditions generally.

2951. Great Britain must have taken cognizance of that also?—She did.

2952. And that is not good enough for India to go on?—Well, England had got to work up to the pre-war rate by merely establishing a gold standard. On account of the international situation she could do it. She is a greater country; her banking system is very good, and for other reasons she is in a position to establish a gold standard which India is not; and therefore the risks which England could take lightly could not be taken lightly by India.

2953. Could you point out the difference between the risk that England has taken and the risk India would take by stabilising the rupee?—Well, England found, on account of a certain conjunction of events, when the sterling dollar rate was rising and when she was within the pre-war parity point, she could take the step of establishing a gold standard, at the same time making sure that gold would not get into internal circulation. Well, that step they had to take in order to safeguard against a possible demand for gold for internal purposes. Their main object was to establish a stable rate of exchange. Well, in India you have got to select a rate. You have an internal currency which is metallic. Its intrinsic value is fairly high. You have got to take into account its internal value in order to select the rate of exchange. In England they have not; they are making use of paper. Whether it was high or low did not matter for them. It does matter for us. Then the relation of internal prices with world prices has got to be taken into account. The rate which it is desirable to maintain between Indian prices and world prices is bound to be different from the rate which is desirable in order to keep the rupee a token coin. The divergence between these two is a matter of great importance, the full significance of which is not always appreciated.

2954. And you think this divergence ought to make everybody cautious before going on to stabilise the rupee?—That is one point; there are others.

2955. That is the most important, I take it?—One point of considerable importance.

2956. Is there any other of equal importance?—Well, another is that Indian economic life is very precarious. It is possible that after 4 years of good harvests, in the next year we shall have two bad ones in succession. If that contingency occurs any attempt to establish a gold exchange standard or a gold standard is bound to be defeated.

2957. That is until India has had 2 or 3 bad years you would not stabilise. If India has another couple of good years you would still wait for a couple of bad years in order to find out how the currency would work. I am asking you whether that would be one of the grounds, whether that would be one of the periods at which to think of stabilisation, when India has had experience of a poor monsoon?—Yes, India's balance of trade for the next few years will matter but that will not be the deciding factor. Certainly if our balance of trade continues to be favourable we ought to be more inclined to stabilise the rupee than otherwise.

2958. Now, in the interval when there is no stabilisation, the remittance of money to the Secretary of State and the remittance of money for Home Charges should continue to be carried on as at present by the Finance Department of the Government of India?—On the advice of the National Currency Board.

2959. Would you have that immediately?—Yes, immediately of course.

2960. (*Sir Purshotamdas Thakurdas.*) You recommend the formation of a National Currency Board. Am I correct in understanding that the Board would guide the operations of the Government of India for remitting money?

2961. (*Chairman.*) Shall we take that a little later, Sir Purshotamdas, unless it is very intimately linked with your argument? I think it is rather opening out a matter which we might deal with separately.

2962. (*Sir Purshotamdas Thakurdas.*) I can wait. I have no more questions to ask now, Sir.

2963. (*Sir Reginald Mant.*) Professor Gyan Chand, I understand that during the intervening period before we stabilise exchange you would aim at securing stability of prices in India, letting exchange vary. Is not that your position?—The fluctuating rate of exchange will decrease the amount of fluctuation in prices in India but it would not stabilise prices. We have no means of stabilising internal prices for the country; but it would make the fluctuation of prices in India less violent.

2964. It would be a steadying factor?—To a certain extent.

2965. I do not quite understand how you would provide for the expansion or contraction of the currency during this period. You would have no expansion or contraction?—I definitely provide for expansion and contraction.

2966. (*Sir Reginald Mant.*) I would like you to explain what your method would be.

2967. (*Chairman.*) That is the scheme which the Professor outlines, is it not, for the free coinage of silver?—Varying directly with the rate of exchange and inversely to the gold price of silver.

2968. (*Sir Reginald Mant.*) Have you considered the largo accumulations of silver in the currency reserve. While we have that amount of surplus silver, would you provide for fresh coinage of silver?—If we could reduce that amount without endangering the convertibility of gold I would not undertake fresh coinage, I would not recommend the undertaking of fresh coinage; but if this reserve cannot be depleted below the present limit or a further limit, then fresh coinage will have to be undertaken.

2969. But you contemplate that the public should be at liberty to present silver and get rupees in exchange?—Yes, the varying amount of silver.

2970. Well, during the period in which there was a large accumulation of rupees in the currency reserve that silver bullion would be useless to Government?—Yes, it won't be of much use.

2971. Would you propose that Government should be required to hold that bullion?—Well, if it can reduce it safely, it should convert it into gold gradually.

2972. You mean that Government should sell that bullion again?—Yes, convert it into gold by selling here or selling abroad.

2973. But is not that rather a wasteful process?—I would prefer Government getting gold from the people and giving currency notes in exchange, but if the other alternative is more convenient from their point of view,—well, to a certain extent, that inconvenience may be put up with. The process is wasteful, there is not the least doubt about that; but there is no better alternative I can think of.

2974. You think it would work satisfactorily?—I have not got the slightest doubt about it.

2975. (*Professor Coyajee.*) Mr. Gyan Chand, in paragraph 9 of your memorandum you observe: "A great deal of nonsense is talked about the gross inequity of the proposals to raise the rate of exchange above 1s. 4d. to the debtors, poor consumers and the taxpayers because the rupee being a token coin like the shilling ought to have a constant value in terms of gold." Now on this subject might I put to you the views of a well-known recent writer on Indian Exchange? In the first place he argues that on account of the shifting of the rate from 1s. 4d., the agricultural classes have lost much on the rural

debt. Do you agree with that?—I do not agree with it at all. I consider it entirely a mistaken view.

2976. Might I present his views a little more at length. He says "If the debts amount to 800 crores it should be remembered that the modification in the value of the rupee will affect 80 million people in the Native States and 247 millions within British jurisdiction. Consequently the twisting of the exchange up to 1s. 6d. means that the cultivating classes will be compelled to find 50 millions more of its equivalent in commodities in order to fulfil this debt if they ever repay it." What do you make of this argument?—Well, the cultivators have received silver and undertake to give silver rupees; they did not undertake to give gold and they won't know they are paying more. As a matter of fact, if prices in India are stable and there is no sudden fall in prices, there will be no injustice whatsoever. Injustice will arise by bringing about deflation of currency or fall of prices.

2977. (*Chairman.*) As this is an argument which the Professor develops in his memorandum, do you think we shall gain any further elucidation by this process?—My view, Sir, is that it is entirely mistaken; this view is entirely mistaken.

2978. (*Sir Alexander Murray.*) I think in reply to previous questions, you indicated that you did not blame the gold exchange standard for the break-down in 1907 and 1914?—I blamed the Government of India and not the gold exchange standard itself.

2979. You also do not blame the gold exchange standard for the rise that took place in Indian prices in 1907 and 1914?—The rise would not have happened if you did not have a gold exchange standard.

2980. You do not object, I understand, to the Government of India acting as an exchange bank to a certain extent so far as remittances are concerned?—I would like to have a separately constituted body for the purpose of giving expert advice to Government.

2981. I thought you indicated in reply to Sir Purshotamdas that you would not have the bank doing this work?—I would have it now for managing remittances and other affairs connected with the currency.

2982. (*Sir Alexander Murray.*) Why should you want that?

2983. (*Chairman.*) Shall we take that question a little later, because I think it would lead on more clearly to that subject if we did so.

2984. (*Sir Alexander Murray.*) One other point: Is there not an objection to adopting the gold standard in the fact, that you referred to when discussing with the Chairman a moment ago, that the position as regards the Federal Reserve Board of the United States has very materially altered since 1914? For instance, it had only about 100 million pounds of gold under their control in 1914, whereas now they have about 600 million pounds; does not thus very great power lie in the hands of that Board, so much so that as a matter of fact we would be putting ourselves almost entirely in the hands of the Federal Reserve Board if we adopt a gold standard?—You say that the danger with regard to the Federal Reserve Board is that it is liable to political pressure?

2985. What I mean is this: one of the objections taken to the gold exchange standard is that it is open to manipulation at the hands of the Government of India or the India Office. Similarly, is it not an objection nowadays to the gold standard itself that world prices and gold prices generally would be liable to manipulation at the hands of the Federal Reserve Board owing to the very large stocks of gold that they control at the present moment?—Or the Bank of England for the matter of that. The Bank of England and the Federal Reserve Board can both regulate and affect their course.

2986. And we are in their hands almost entirely?—As much in their hands as we in India are in the hands of the Government of India.

2987. Then why do you prefer to be put into the hands of the Federal Reserve Board or the Bank of England, rather than in the hands of the Government of India?—The ultimate control is going to rest with the Government of India.

2988. (*Chairman.*) I think that point might be developed later. Let us clear the air by taking the next point of substance in your memorandum, that is the proposal for a new currency board which is to be nominated by Government with a majority of non-officials. I want, in the first place, to know what your opinions are in regard to the policy that is to be pursued by this Board. If I understand you aright, this is the authority which will manage the currency?—Yes; it will be in charge of the currency system.

2989. Its object then will be, as I understand the recommendation which you developed in answer to my colleagues, not so much to regard the stability of exchange as the stability of prices?—Yes.

2990. The question I wanted to put here is upon what information would it proceed in acting to secure the stability of prices in the country?—That would not be its main object or the only object.

2991. Shall we take the answer you are just giving a little later? Let me put my question again. When they are pursuing this object, whether it is the main or not the main one, of securing the stability of prices, what statistical information will be at their disposal to assist them in securing their object?—Movements of prices; if the prices are rising they will know the time for action has come.

2992. How will price movements be recorded and brought to their notice in a useful form?—I might here say that the present index number is not suitable for the purpose. A new index number will have to be reconstructed to indicate the extent of appreciation or depreciation in the purchasing power of money.

2993. Would you regard it as essential for the carrying out of the policy to which you have referred that a more scientific statistically—based index number should be prepared?—Yes; on the basis of prices compiled by much better men than we have got at present.

2994. By much better methods?—Not methods; the men on whose quotations we depend for constructing index numbers are not fit for the work they are doing, and therefore compilation will have to come from better sources. I do not refer at all to the higher authorities—I am not in any way questioning their efficiency; I am saying that the district officials and other people upon whose local quotations the Government of India depend are not in a position to give correct quotations, and therefore we will have to introduce a better system.

2995. I asked you to postpone an answer just now in which you were about to say that the stabilisation of prices would not be the principal object of the currency board. What then would be the principal object of the currency board?—For the present I would entrust four functions to it: first, declaring the varying rate of seigniorage.

2996. As regards the minting of rupees?—Yes.

2997. That would be practically a mechanical thing?—Yes; it will be mechanical; the second will be purchase of silver or making arrangements for the purchase of silver. The third will be the question of investments of the paper currency, to what extent they should be invested in Indian Bills of Exchange and to what extent in short term securities elsewhere. The fourth will be advising the Government of India on the question of remittances, as to the time at which they are to buy sterling bills in India.

2998. All these functions of the currency board are comparatively routine functions?—Not the question of investments.

2999. The question as to whether such and such a sum for investment is to be invested in long term or short term securities?—How much money is to be invested in Indian Bills of Exchange, whether 12 or 18 or 20 crores, and how much is to be got in

England in short term securities is a very vital question on which the total amount of circulation in India depends; and therefore it will call for intelligence and judgment.

3000. That is a very clear account. The next question that suggests itself to me is this: by what means is this policy of stabilisation of prices to be forwarded?—It is a very difficult question which I am not in a position to answer in a limited compass. But we will have to take into account the amount of business, the quantity of money in circulation, the conditions of employment, whether there is any famine in the country or whether the conditions are fairly normal, and the conditions of internal and external trade.

3001. What authority would have to consider all these things?—The National Currency Board.

3002. What will also be its function?—In considering the question of investments, whether more money is to be put into circulation in India or whether more money is to be invested in short term securities elsewhere, it will have to take all these considerations into account.

3003. Let us then return to my question, which was this: by what means will this policy of the stabilisation of prices be forwarded? You refer to the essential considerations which will have to be taken into account, and then the next question is what action can be taken to ensure the stabilisation of prices?—The only action now that I can think of is either putting more money into circulation or withdrawing money from circulation.

3004. In whose hands will it be to make decisions upon whether more money is to be put into circulation or withdraw?—The National Currency Board with the sanction of the Government of India.

3005. That would be a very important function, would it not?—But it will be brought about by varying the investments.

3006. Will you describe to us how you would bring about the increase of the circulation or the decrease of the circulation by the variation of these investments?—By purchasing sterling bills it can increase the quantity of money in circulation; and by deciding to invest less money in Indian Bills of Exchange it will withdraw money from circulation or withhold its increase. May I just put in another word? I do not attach very great importance to the function of stabilisation, because I do not expect much that way; I do not think we are in a position to manipulate the currency system in such a way as to bring about a comparatively stable level of prices in India; the mechanism is not there; to a certain extent the National Currency Board can vary the amount, but that would not be very appreciable, and therefore I do not count it as one of the functions of the Currency Board.

3007. So that you do not really anticipate that you will achieve any great stabilisation of prices?—We are not in a position to do so, any way.

3008. It seems as if a rather captious critic might say that you let the stability of exchange go and do not get stability of prices in its place?—We will have less instability of prices; that is an advantage in itself.

3009. I want to put to you another alternative. It might be said by a critic in objection to your scheme, simply on the question of administrative machinery, that the main object to be attained is a co-ordination of control over banking reserves and currency exchange reserves, and that a divorcement between the control of these two things is to the disadvantage of the country. It may be said, then, that a currency board is undesirable because it not only maintains the present divorcement between the control of banking and currency reserves, but it introduces an even further impermeable stratum between the bank authorities and the Government of India?—The stratum would not be quite impermeable because the banking interests will be represented on the National Currency Board. I definitely recommend that. Then it is going to work in close collaboration with the Government of India and as the Imperial Bank is practically doing the same work there will be close association between the Imperial Bank and the National Currency Board. I do not anticipate that there will be greater divorce on account of the introduction of a National Currency Board. I anticipate closer association as a matter of fact.

3010. Let me ask you now to contemplate yet another alternative, which is the transfer of the control of the note issue and reserves from the Government to the Imperial Bank of India. What is your opinion upon this?—I have expressed my opinion in the memorandum and that is just this. If I had my way I would entrust the note issue to the Central Board of the Imperial Bank. But the Central Board of the Imperial Bank is not above suspicion and before it becomes what I call the keeper of the currency conscience of the country it ought to inspire a greater confideuce which it is not likely to do in the near future.

3011. I think I should ask you to amplify a little your answer to the effect that the Central Board of the Imperial Bank is not above suspicion. What are you referring to in this connection?—Well, I don't make any definite charges against the Bank. I am not in a position to know, but I know men who are in a position to speak with authority have brought the charge of racial discrimination against the Board of the Bank, that it does not give accommodation to Indians as freely as it ought to, or at least the local boards do not. The charge has been brought again and again by men who are in business. Now I don't know how far that charge is justified. But I know from my personal knowledge that the Central Board of the Imperial Bank will not be considered a non-partisan body. It is too much identified with particular interests to inspire confidence in the minds of the Indians.

3012. I understand that if the Central Bank were to possess that confidence, to the deplorable lack of which you have referred, you would be content to entrust the control of the note issue and the Reserve to the Central Bank, and I also rather gather that you prefer that to your proposal for a Central Board? —Well, inasmuch as I do not anticipate the Imperial Bank inspiring greater confidence in future than it does at present, I believe that the constitution of a National Currency Board is the better alternative.

3013. You are of opinion, I understand, therefore, that it would be useless to attempt to make any changes in the constitution of the Imperial Bank such as would enable you to recommend the transfer to which I have referred?—Unless the control is radically changed.

3014. What radical changes would you propose?—Indians should be in a position of predominance.

3015. How would you secure that predominance? —I cannot secure it and therefore I give up the attempt.

3016. I do not mean practically how you would secure predominance, but by what proposed reconstitution of the organs of government of the bank would you secure it?—I would make it, and I would see that Indian interests are freely represented.

3017. I do not want to press you for details. You have not worked out in your own mind the constitution of the Imperial Bank, but I understand that the point upon which you lay vital stress is that there should be a preponderance of Indian members in the control of the bank?—Yes, I would attach importance to that consideration.

3018. Having cleared out of the way that rather perhaps less purely economic aspect of the situation, with an Imperial Bank reconstituted in such a manner as to inspire confidence in you and in others, would you prefer the control of the note issue and the reserves against the note issue by a Central Bank to a control by such an intermediary Currency Board as that to which you have referred?—The

question of confidence is vital and has got an economic aspect as well.

3019. I rather wanted to get away from the question of confidence to a purely economic consideration as to whether, in your opinion, the ideal method for the control of a currency is by a Central Bank which inspires confidence or by a joint Currency Board?—Yes, I would prefer a Board to a Central Bank provided it has set before itself a high standard of public duty and shown that it is not merely a profit-earning concern, but thinks of the nation first and profits afterwards.

3020. You insist upon the well recognised doctrine that the Central Bank has a duty to the community in addition to, or even before, its duty to its shareholders?—Yes.

3021. I think that completes the questions I wanted to ask about that subject, except for this final question. I understand that you express a strong opinion, in regard to any scheme for administration, in favour of the unification of the paper currency reserve and the gold standard reserve?—I do.

3022. Could you tell us in outline for what special reasons you lay so strong an emphasis upon that?—My only reason for not wanting a separate gold standard reserve to be maintained is this, that if my proposal that the bulk of the invested portion of the paper currency reserve should consist of short-dated foreign securities is accepted, then this reserve can very well be used for the same purposes for which the gold standard reserve is used to-day, and the fact that the securities will be short-dated will, as a matter of fact, make it better from that point of view, and eventually I do expect that the invested portion of the paper currency reserve will, to a certain extent, be used for the support of exchange, though I do not want that to be its main purpose. May I amplify this point for a minute? You know very well that Japan has been making use of its paper currency reserve for supporting exchange, and part of the invested portion has been kept in the United States. She has, without any embarrassment whatsoever been able to manage her currency system on that basis. I do not see any reason why we should not be in a position to do so.

3023. Have you any other reasons?—No, I have got no other reasons just now.

3024. (*Chairman.*) I think there are one or two supplementary questions which my colleagues wanted to ask on the Currency Board. Sir Purshotamdas, I interrupted you, I am afraid, on that question.

3025. (*Sir Purshotamdas Thakurdas.*) I will just take it up at that point. Would you then, while exchange is left unstabilised according to your scheme, entrust the question of remittances to England to this National Currency Board?—I would recommend the Government of India to rely upon its advice, but the final decision, of course, will lie with the Finance Department.

3026. I see; then this will be merely an advisory body, and in case of difference of opinion between the advisory body and the Finance Member the Finance Member will prevail?—Yes. He will have the last word.

3027. When, therefore, the exchange is left absolutely free, you think that this will inspire more confidence in the public as far as the policy of the Government of India is concerned, or do you think it will expose them to greater misunderstanding by the people?—Well, the possibility of misunderstanding is likely to arise under any circumstances, but if the Government of India accepts it as a recognised policy that the National Currency Board is going to guide them and they, as far as possible, are going to rely upon its advice, then the possibility of misunderstanding will be certainly small.

3028. You mean that should anything go radically wrong after a case in which the National Currency Board's recommendation has been accepted, the Government of India should take shelter behind it and say that, after all, they had accepted the recommendation of the Board, and what else could they have done?—They can very well say that we consulted a body of experts which committed an error of judgment, and therefore if it turns out to be a mistake it is their mistake.

3029. So, though technically the final decision should lie with the Finance Member for all practical purposes, the responsibility will be with this Board?—In case the National Currency Board gives one opinion and the Finance Member chooses to go his own way then the responsibility will lie with the Finance Member and not with the National Currency Board.

3030. That means that whosoever's decision is upheld finally would carry the responsibility?—It will be mutual give and take.

3031. Yes, where there can be a compromise; but when you leave exchange to move about without any stabilisation or effort at it, should anything extreme happen and a compromise is impossible (and these things have happened in the past as you yourself relate in your paper) and it is a question as to which course is the more correct with regard to either to world conditions or the capacity of India to stand a certain strain. On such an occasion, would you lay the responsibility on whosoever's opinion is finally accepted?—I do not think the matter is as serious as that. Its only function is to advise the Government of India on the question of the time of remittances, but the amount is fixed for them, and a certain amount of money has got to be sent.

3032. Oh; would you fix the amount?—The amount is fixed by circumstances. A certain amount of home charges has got to be met.

3033. A certain amount of home charges have got to be remitted in a year. But it does not, therefore, necessarily follow that it is fixed for a month?—That is why I am saying that the National Currency Board will advise as to the time of remittances and the amount to be sent in a particular month.

3034. I see. Whether remittances should be made every month or every fortnight?—In certain cases even the needs of the next year can be anticipated. It is possible that they might like to send them up.

3035. Then would you allow that, too?—But, as I have said definitely, the Government of India or the National Currency Board should not try to influence the rate of exchange. They should try to influence the favourable conditions that might exist, but they should not set the pace themselves.

3036. But as they have such large amounts to deal with, are they not the largest dealers in the exchange market?—They do account for a great deal. There is not the slightest doubt about that. But if they find there is a great supply of sterling bullion on account of large exports, they can take advantage of the situation and lay money in England.

3037. And if you find the commercial and banking circles outside are waiting to see which way the Government will first take steps, the Government will not be able to help giving a lead?—Well, if they find that the Commercial community is waiting on the Government of India, the Government of India can for the time being refuse to take any steps.

3038. They must, then, follow the trend of commercial circles, and if the commercial circles are waiting to see which way the Government of India go, then both must come to a standstill?—This state of affairs is not likely to continue long.

3039. Anyway, you think that a scheme like that is feasible and can be put into practical operation?—I do not see any difficulty.

3040. In the meantime, Professor Gyan Chand, if, owing to the operations being left open absolutely to the sweet will of the commercial interests, exchange should fluctuate very widely, you do not think that that would do any material harm to India?—It all depends what you call more widely.

3041. Within a range of threepence; indeed, a witness did suggest a range of twopence?—Yes, I should consider it a great misfortune if it fluctuates between 1s. 4d. and 1s. 6d.

3042. Supposing it went down to 1s. 3d. and went up to 1s. 7d.?—It would be wider than it is, but I do not think international trade is going to be paralysed.

3043. What about India?—I mean the international trade of India.

3044. And as far as internal prices in India are concerned, they would not be affected at all?—The fluctuations would take place in response to the world conditions and the Indian conditions will remain stable or more stable on account of the fluctuating rate of exchange.

3045. If you had a threepenny drop or rise between any two or three months the prices in India would remain stable?—Well, the prices in India are not so very stable. They do not respond to the rate of exchange. They are more sluggish than that. And if you analyse the price figures of a number of years you will not see any violent price fluctuations in India on account of violent fluctuations in the rate of exchange?

3046. I take it, of course, that you have come to this conclusion after watching the operations of exchange and prices in important centres like Karachi and the Punjab and cotton centres like Berar and Central Provinces. I am just asking if you have come to this decision after watching the connection between exchange and prices in these centres?—No, I have only come to the conclusion on the basis of the index number and the rate of exchange. I find that the fluctuations in the rate of exchange do not bring about immediate or corresponding fluctuations in the level of prices.

3047. And if you were told by any person who was in daily touch with commerce that a half-penny difference in exchange does make a material difference in prices of cotton or wheat offered to growers, would you modify your opinion?—It does make a difference so far as the speculators or the dealers are concerned.

3048. It does make a difference as far as the prices available to the cultivators up-country are concerned?—The recorded prices do not show it.

3049. Exchange to-day is 1s. 6$\frac{3}{16}$d. for instance. If it goes up to 1s. 6d. and 3 farthings, prices must drop in up-country centres before the exporter can buy. And if the cultivator has to sell when his crop is being marketted, fluctuations in exchange do affect his prices?—Well, to a certain extent. But the recorded prices do not show this. I am referring to the prices recorded in official statistics.

3050. Oh, you are only going on what is recorded in the official statistics, and you do not say this from any personal knowledge of following daily fluctuations in up-country centres?—I am not in a position to acquire personal knowledge.

3051. (*Chairman.*) I interrupted Sir Alexander Murray on this point. Perhaps he would like to pick up his examination at the point at which I interrupted him.

3052. (*Sir Alexander Murray.*) We were talking of the constitution of the control in connection with exchange matters. You have answered several of the points that I purposed raising in the meantime. Referring to the constitution of your proposed Board, apart from the mere counting of heads that so many would be Indians and so many representing other interests, how would you actually allocate all interests? Would it be according to the areas—some from Bombay, some from Calcutta, some from Madras, and so on?—It is very difficult to say anything positive on that point, but I would not like interests to be represented on the National Currency Board. I would like the Government of India to choose those men whose advice they think is valuable.

3053. But have they not done that now under the constitution of the existing Central Board of the Imperial Bank of India?—Only those four gentlemen whom you were referring to.

3054. And the managing governors also?—Well, the managing governors are to a certain extent responsible to the stock holders.

3055. Are they not appointed by the Viceroy in Council?—Yes, but their range of choice is very limited on account of the fact that the managing governors and the governor have got to be appointed from among a few people—bankers who have been doing that work already.

3056. Would that not always be the case? Presumably your Board would be made up of men of skill with financial knowledge also. You would have to choose them from that particular class of people.—I don't think any Indian has an opportunity of becoming a governor in the bank for a very long time to come, and I think on the National Currency Board Indians would be utilised to a greater extent. They possess financial knowledge and skill as much as other people do.

3057. You will leave the constitution of the Board to the Government of India?—Yes, I will.

3058. Well, the Government of India have elected six out of the present Board. The Government of India have actually appointed six of the governors of the Central Board?—Yes.

3059. Well, what are your objections to them? Are there any objections to them?—The total number is 16.

3060. One moment, there are 13 members, I think, with votes, and of those 13 members, 7 are appointed now by the Government of India?—One is the Controller of Currency.

3061. There are two managing governors that are appointed by the Government of India; there are four governors appointed by the Government of India; and the Controller of Currency appointed by the Government of India. Altogether there are 7 out of 13. So that now under the present constitution the nominees of the Government of India are in the majority?—The range of choice is very limited for the Government of India. For the Government of India knows that the Imperial Bank is a private concern.

3062. (*Chairman.*) I do not think the witness quite follows your question, Sir Alexander.

3063. (*Sir Alexander Murray.*) Well, the question I am putting is that under the existing constitution the Government nominees have a majority on the Board, and can therefore dictate the policy of the Board. What more do you want under your other Board?

3064. (*Chairman.*) Just one moment to make the question quite clear. I am reminded that the Controller of Currency cannot vote.

3065. (*Sir Alexander Murray.*) Then anyhow there are six out of 12 with votes, half at any rate of the Board is constituted by the Government of India?—That means the managing governors and four others. As I was going to say, the range of choice for the governors and managing governors is very limited.

3066. And will continue to be for many years to come?—I do expect that for many years to come as far as the Imperial Bank is concerned, and therefore there is no likelihood of Indians being appointed managing governors or governor of the Imperial Bank even if the Government of India were desirous of doing so.

3067. But the election lies with the Government of India now?—Yes, but they have got to look to the fact that the Imperial Bank has got to be managed for the stock-holders to a certain extent. Their interest cannot be entirely neglected, and though they will choose the best men for the purpose, the number of men available is limited, and therefore their hands are tied.

3068. (*Chairman.*) Sir Alexander, the witness gives us his opinion as to a probability. I do not think one can really analyse that?—Yes, it is a question possibly of equation, but at the same time I am relating what is likely to take place.

3069. (*Sir Norcot Warren.*) May I ask if there is anything in the Act to prevent an Indian from being appointed as managing governor now?

3070. (*Chairman.*) I think the witness has answered that, that it is unlikely for many years to come.

3071. (*Sir Norcot Warren.*) Well, whose fault is that?—I am not allocating faults. I am stating the position.

3072. Is it the fault of the Government of India if you cannot produce men who are competent to be managing governors now?—There can be a different opinion as to the degree of competence required, but I am not allocating blame. I am only pointing out the facts. For some time the Indians have got no chance of being appointed governors or managing governor, and it may be the fault of the Indians or may be the fault of the Government.

3073. (*Sir Maneckji Dadabhoy.*) This newly-constituted Currency Board, this Currency Board which you recommend, can you give me from the history of any country in the world any parallel to this Board? Would you only accept a suggestion which has been carried out elsewhere? Will you take it that way?

3074. (*Chairman.*) I think it is a question which it is comparatively easy to answer, is it not?—The Federal Reserve Bank is almost a National Currency Board. Some of the members are appointed by the President and two officers, the Controller of Currency, and the Secretary are ex-officio members. I recommend that the Controller of Currency and Finance Secretary and seven other members or five members should be appointed by the Government of India.

3075. (*Sir Maneckji Dadabhoy.*) And these members who will be appointed by the Government of India can represent fluctuating commercial interests in the various parts of the country?—Well, my object would bo to eliminate fluctuating interests, to get experts who will give disinterested opinion. In the atmosphere in which we are living, I know this is very difficult. But still the Government of India should be guided in its choice not by propitiating this or that interest, but get the best men who will give advice.

3076. But, as you stated, the ultimate deciding authority will be the Finance Minister. Would not the Finance Minister be open to the charge of having chosen his own men?—He would be open to that charge, but he will try to get the men of unquestioned ability and integrity.

3077. Then it will still form a department of the State under the Finance Minister?—Just in the same way as the Central Board of Income-tax is a department of the State, but still the Central Board of Revenue is responsible for the administration.

3078. Will you give this Board any statutory authority or power?—In what sense?

3079. For the control and management of their organisation and the purchase of silver and matters to regulate their proper investment?—The constitution of this Board would require legislation. The changes which I recommend, if they are to be accepted, will require statutory changes.

3080. And this Board would be wholly dependant on the departments of Government for all statistical and other information?—If the statistical information is inadequate, it will press for more information or ask for information to be obtained from better sources. It can easily do that.

3081. Is it not possible to reconstitute the Imperial Bank on the lines of the recommendations for the constitution of the new Currency Board as suggested by you?—Well, if it were possible I would say do so. But as I don't think that it can be done taking into account the interests of the stock-holders who ought to have a say in the matter, I think the easiest way is to constitute a Central Currency Board.

3082. You stated in answer to one of my colleagues that you would insist on the preponderance of Indians on the Currency Board?—I would.

3083. How would you secure that?—Well, I would take it that the Government of India will try to appoint more Indians than non-Indians. That is the only way of securing it.

3084. You think they could secure at present Indians on this Board with the requisite information and knowledge?—Well, I do not think we are so very bankrupt in business and banking ability as not to be able to find four or five Indians who can represent India and her national interests on this Board.

3085. (*Sir Henry Strakosch.*) You said a little while ago that prices in India move very sluggishly and do not respond to the movement of exchange very rapidly? — I should not say very sluggishly, but they are not very sensitive. I would put it that way.

3086. Now if you had no declared policy with regard to the stabilisation of your exchange, and the fluctuations in exchange were wide, would that not be accentuated by speculative dealings in exchange and corresponding movements in the export and import trade?—Well, I am not in a position to give any definite answer to that question because I have not got any experience of a speculative market but I do think that as far as prices in general are concerned, as far as prices in the mufassil are concerned, they would not respond very readily to the manipulations of the speculators.

3087. You have followed the experiences of recent years in regard to currencies that were managed and not linked to gold, and did you not observe that the fluctuations in the exchanges are usually very violent?—Yes in cases like those of Germany and Austria, and in a case like France also.

3088. Even other countries. What importance do you attach to the maladjustment between the internal and external purchasing power of money?—Well, the only importance that I attach is that maladjustment one way or the other is likely to set certain forces at work which otherwise would not be there.

3089. But are not those maladjustments very disturbing to the internal economic life of a country?—Well, if the maladjustment is very pronounced, to a certain extent the economic life of a country would be dislocated, but if the internal conditions of a country make for stability, maladjustment will not count for much.

3090. I do not quite appreciate that point. I should like to ask you why the divergence of internal prices in relation to external prices should not be injurious to the internal economic life of a country?—Taken by itself, it should have an injurious effect, and the ideal is to bring about a nice adjustment between conditions in India and conditions elsewhere. But we are neither in a position to control conditions elsewhere, nor in a position to control conditions here and therefore maladjustments are likely to arise. The other alternative is to look to the internal conditions and see that the conditions are fairly stable, conditions of labour, conditions of capital, conditions of production.

3091. We are talking now about currency: how would you establish that stability of employment, of wages and so forth, by what processes?—The other things depend not so much on currency as on conditions of supply and demand, market conditions and all the rest of it. If we have got a good rainfall, if no particular area is affected by famine, if the demand elsewhere is good, I daresay conditions in India will be fairly stable; the maladjustments will have a disturbing effect, but that disturbing effect will be counteracted for the other conditions and the demand for Indian goods.

3092. If internal prices in India, for instance, were far higher than the external purchasing power of the rupee and if in consequence that was a flood of imports into India, would you regard it as unsound?—I wound not regard it as sound. If the maladjustment is very striking, I would take some measures, but you should not sacrifice everything else for that purpose.

3093. What do you mean by everything else? There is nothing else. It is true, is it not, that the aim of all monetary policy is stability?—The one aim which has been consistently ignored.

3094. But we are now thinking how would you order things in India to achieve that end? And I am just mentioning to you that if you leave the movement of exchange entirely to the accident of the moment, you are not doing anything towards that ideal?—Well, I am doing what I think is the right thing under the circumstances and that is because the possibility of maladjustment is minimized on account of the fluctuating rate of exchange.

3095. The maladjustment of prices is mitigated by the fluctuation of exchange? But I have just shown, and I think you will agree, that the maladjustment arises from violent changes in the external purchasing power of money?—The rate of exchange will fluctuate with fluctuations of price levels elsewhere. It would not be an independent factor.

3096. But they deviate very widely? If you are hitched to nothing they are bound to deviate very widely?—Now the point is if you have got fairly stable conditions in India and unstable conditions elsewhere, then the best way of securing internal stability is to allow the rate of exchange to fluctuate, to have mobility rather than fixity.

3097. And if conditions outside India are not stable, what would be your measures?—My only measure would be to let exchange take care of itself and never mind the maladjustment of prices. That is not likely to arise because the rate of exchange will rise if prices rise elsewhere and the rate of exchange will fall if prices fall elsewhere.

3098. There is one other point. In chapter VII of your memorandum you deal with the question of banking in India and you complain of the lack of cohesion amongst Banks. I take it, and I think you have expressed it, that the end and aim should be to foster the banking habit of the people?—Yes.

3099. By what process would you produce the necessary cohesion to satisfy this condition?—Well, I would have a well-co-ordinated system of banking after careful inquiry. Our information about the present banking system is very inadequate and therefore after full inquiry we will have to set up a new system which will provide for all things and will revolve round a central institution.

3100. You make the central institution the pivot of your future banking system? That will give a cohesion to the system?—Yes.

3101. Is not that rather in conflict with your suggestion regarding the future management of the currency? If you do need a central institution round which you want to build up a new co-ordinated system of banking, is it not logical to say that that institution should also manage the currency?—I have definitely said that the development of this system is going to take a very long time; it is not a question of a decade.

3102. Where would you begin to establish that system? Would you begin by establishing a central institution round which these banks will cluster, or would you first have the banks round the centre?—We have got the rural banks already, we have got the joint-stock banks already, we have got the exchange banks already. We need industrial banks, and all these should be linked to the central institution which has to be made responsible for the entire working of the banking system and also given the power of control. Now the chief point is how to find room for the indigenous system which is very widespread and about which we know so little. If we, after inquiry, can bring about a well-co-ordinated system, then a central institution can very well take the place of the national currency Board but I am afraid the Imperial Bank will have to be re-constituted radically if it is to serve that purpose.

3103. You just said, "we have in this country joint-stock Banks, agricultural Banks, industrial Banks"?—We have not got any industrial Banks to speak of.

3104. May I ask you what you call an industrial Bank?—Its main function is to foster the industrial development of a country.

3105. Do you call that a Bank? What is the investment Trust in England?—But that is not a Bank. A bank is an institution which takes deposits from the public and does banking business.

3106. What you have in mind is investment business which is not banking, properly so called?—Well, this is taken as banking by certain students on the subject and I take it as such.

3107. But that is purely a misnomer?—But there is such a thing as investment banking, industrial banking; these phrases have found currency.

3108. You say you have all these Banks, all that is lacking is co-ordination?—A well thought-out policy of co-ordination.

3109. Now co-ordination is rather a vague term: what do you understand by co-ordination? Will you just sketch very briefly what would be your plan?—I have not fully thought the matter out in detail and I am afraid what I may say may not be a very logical presentation of my views. You have first to provide for rural banks which are mostly under the present circumstances doing credit work; they are giving loans for a short period. They cannot give loans for long periods because their deposits are sort-term deposits. I would like to provide for a long-term deposits for the agricultural community.

3110. How would you do that?—By developing the banking habit by giving a higher rate of interest; that is the only way.

3111. In other words you would have to attract long-term deposits and build up reserves?—Yes. Their reserves are very inadequate. Then, we should provide for industrial banks, then we should have long-term deposits also for the artisans, the cottage industries. We want them for our economic life; their number is very small and they are giving loans for short periods. We want them to give loans for longer periods. These small banks will be built up into regional banks, for regions just bigger than a district. Then they can be affiliated to a central institution for the province, which area need not correspond to the territorial province. I use the phrase in the sense that certain areas can be kept together which have a certain amount of economic unity, not in the political sense of the word. Then we will have the co-operative Banks federated into a central co-operative Bank.

3112. How would you ensure that those Banks will always meet their liabilities?—At present the co-operative system is managed by the Government, is controlled by the Government, and as the co-operative system is developed, I expect that they will be able by wise management to meet their liabilities.

3113. You do not think that in order to strengthen the banking system it would be well to centralise rather than decentralise banking reserves?—I am for centralisation of reserves.

3114. You are for centralisation of reserves?—Yes.

3115. What does that mean in fact in your organisation?—It means collecting up of all spare reserves of the country and working up through these channels and bringing them into a central institution and mobilising in such a way that it is available in all parts of the country.

3116. So that the central institution is really the most vital part of that co-ordination that you have in mind?—It is the last link.

3117. Why not start with it?—If you have not got any bottom it is useless to have the top?

3118. Why do you call these other institutions the bottom? Why should you not call the central Bank the bottom?—It will be the coping stone of the structure.

3119. (*Sir Purshotamdas Thakurdas.*) I thought Professor Gyan Chand said that he would like the

new Currency Board to collect data for price levels?—I was put this question, whether it would really go upon the present statistics or call for better statistics.

3120. Would you tell us what sort of improvement you would make in the present method of collecting statistics?—You are putting to me a very difficult question which requires more thought than I have been able to give. But I think that the collection of those statistics should be by trained students. At present we rely upon subordinate officials who have had no training.

3121. They only report the prices?—Yes, report the prices. But reporting the prices also requires certain judgment. There are a number of prices in the market at the time and they have to select the prices.

3122. (*Chairman.*) You do not want a student to find out how much a thing costs, do you?—But when a number of prices have to be selected from, it requires some discrimination to find out which price is typical.

3123. (*Sir Purshotamdas Thakurdas.*) You simply find out the price of any one article that you may have in mind. The prices are collected, wholesale and retail, as things are sold in a certain area. The man has got to go and find out how many seers per rupee a thing sells. It is quite possible that he may go to a little more expensive shop or a little less expensive one. I want to know where the difficulty lies?—If he goes to a local market, he finds different kinds of wheat, for instance, in different markets. He will have to take one price as the price of wheat and for that purpose he will have to choose particular prices. He will have to find out which price is typical and which not, and this will require certain discrimination.

3124. There are three or four varieties of wheat, say, in the market; what is the difference between these varieties?—The difference in quality.

3125. What would be the difference in price? Up to what extent would the figures be ultimately wrong? Supposing he went to the most expensive variety and took the rate of that or to the cheapest variety and took the rate of that, what will be the difference, the margin?—You mean the margin of error.

3126. Yes, the margin of error?—I do not know sufficiently about the markets.

3127. Then how are we to say that the present figures are incorrect and can be improved upon?—I do admit my limitations; but at the same time that is my view which I want to work out.

3128. That is your impression; but you cannot give any instances of the variations caused?—My impression is that the present statistics are defective.

3129. But you cannot give us any concrete instances?—I will try to work it out.

3130. (*Sir Purshotamdas Thakurdas.*) We will be much obliged if you can send us the result after working it out.

3131. (*Chairman.*) Perhaps you would consider that. We must not make an undue call on your time, but if you work it out it is in the interests of the Commission to see the result of any consideration you give to the matter?—I will certainly make an attempt.

3132. (*Chairman.*) I express to you, on behalf of the Commission, our thanks for the assistance you have given to us to-day and for your very helpful memorandum.

(*The witness withdrew.*)

AT THE TOWN HALL, BOMBAY.

TENTH DAY.

Monday, December 7th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E.
Mr. G. H. BAXTER. } (*Secretaries.*)

Messrs. V. A. GRANTHAM and H. A. W. BRENT, representing the Bombay Chamber of Commerce, called and examined.

3133. (*Chairman.*) Mr. Grantham, you are President of the Bombay Chamber of Commerce?—Yes.

3134. And a Member of the Legislative Council?—Yes.

3135. And you appear to give us the benefit of the views of the Bombay Chamber of Commerce?—That is so.

3136. With Mr. Brent?—Yes.

3137. You, Mr. Brent, are the Chairman of the Financial Committee of the Chamber of Commerce?—Yes.

3138. And Manager of the International Banking Corporation?—Yes.

3139. And you have present with you the Secretary of the Chamber?—Yes.

3140. We have the benefit of a very full memorandum* which I understand sets forth the views of the Chamber of Commerce, and I understand that I should address my questions to you in the first place, Mr. Grantham?—(*Mr. Grantham.*) That will be convenient, and I will ask Mr. Brent to reply where I am not prepared to.

3141. If you please. Your very full memorandum, for which the Commission is obliged, will save me a great deal of time in going into details. I will, if I may, ask a few questions where you lay special emphasis on your proposals and criticisms for the purpose of elucidating any points that appear capable of elucidation. In the first place, in the second paragraph of your memorandum you refer to the uncertainty surrounding world gold values. You refer to them as it were to dismiss them as of primary importance in considering the period of stabilisation, but I should like to ask you whether you can amplify a little what you consider to be the uncertainties at the present time surrounding world gold values?—I think the only answer to give to that is that we are not sure in India where the supply of gold is to come from and exactly what action the United States is going to take.

3142. You have in mind the possibility of some change in monetary policy in the United States such as would tend to set free a substantial addition to the world's gold supply?—That was at the back of our minds.

3143. There is no other outstanding possibility to upset the world's gold values in your mind?—(*Mr. Brent.*) No. (*Mr. Grantham.*) I do not think so, Sir.

3144. In paragraph 4 of your memorandum you begin to deal with the best standard for the Indian currency. You deal there with the instability of exchange due to the circumstance that by pre-war methods, the rupee was stabilised in terms of sterling and not of gold, and you propose, as I understand, to establish stability in reference to gold rather than sterling?—That is so, Sir.

3145. Will you tell me what alterations you propose in pre-war methods in order to establish the stability of the rupee in terms of gold rather than of sterling? I think perhaps I can make myself clearer if I say I am referring now to the transition period which you outline before the arrival at a gold currency when you maintain something in the nature of an exchange standard; and what I want to make clear is, assuming the maintenance of an exchange standard, what differences you propose in contrast with pre-war methods, the pre-war exchange standard, in order to stabilise the rupee on gold and not on sterling?—(*Mr. Brent.*) Well, the transition period is one that we discussed at great length, and we really could formulate no scheme to enable the conversion gradually from a gold exchange standard to a pure gold standard—as to what method should be adopted during the transition period.

3146. I have not yet made myself quite clear, I can see. You recommend a transition period during which we should have an exchange standard?—Yes, Sir.

3147. You recommend that there should be a gold exchange standard and not a sterling exchange standard?—(*Mr. Brent.*) Well, I think our recommendation is synonymous. I mean our intention is synonymous because we state you will see, in our report, conversion either in gold or sterling.

3148. Then you do not recommend any alteration in pre-war methods in order, theoretically and practically, to stabilise the rupee on gold rather than on sterling?—(*Mr. Grantham.*) I think we do. We have suggested there should be some limitation on the issue of rupees.

3149. Let me put a leading question. Would you propose, in order to establish it as a gold exchange standard, that you should keep part of your exchange standard reserves in the currencies of other gold standard countries rather than in sterling countries?—(*Mr. Brent.*) That was a point we never discussed because we were working purely on sterling but I do not think there is any objection. (*Mr. Grantham.*) No, we have recommended in this evidence that the gold standard reserve should be kept in London entirely and I think it follows that there would be no great objection to keeping a portion of it in other foreign countries.

3150. I understand from the answers you have just given that, as a matter of fact, you attach no importance to it, and that, in the transition period, you will be content if the reserves, so far as they are kept in foreign currencies, are kept in sterling?—(*Mr. Grantham.*) That is so.

3151. Now I want to turn to paragraph 5 of your memorandum, and to ask you some questions on your analysis of the disadvantages of the exchange standard system which lead you to propose finally a full gold standard; and in order, if I may say so, to test your arguments my questions will be directed to ascertaining whether these defects are not remediable on a perfected exchange standard system, or whether the only possible remedy is to be found in a full gold standard. Now taking them one by one, first of all I will refer to the more automatic nature of a full gold currency. Supposing that the pre-war exchange system was not automatic in its nature, might not the exchange standard system be made automatic by the combination of the two reserves into one, and by their transfer for control and management to a Central Bank. The only question that I want to raise there is, would an exchange standard system altered in that manner not become an automatic system?—(*Mr. Grantham.*) I think our feeling is, Sir, that it could not because unless the balance of trade is liquidated by imports of gold which are purely automatic, we cannot see any other system which can be purely automatic; it must be managed even if it is managed by the Imperial Bank.

3152. Contemplating an exchange standard system with combined reserves in the hands of the Bank, what would be the opportunity for the management of such a system?—(*Mr. Brent.*) Assuming that there would be no complete conversion; unless notes were convertible into gold it must be a managed system.

3153. Assuming that notes and rupees are both freely convertible into foreign exchange, the question which would seem to need consideration is whether there would be any opportunity for the management of a system of the sort?—(*Mr. Grantham.*) That would depend on foreign exchange maintaining its true value in gold.

3154. That would not depend upon the Bank: it would not be within their sphere of interference?—No.

3155. If you accept the free liability to give foreign exchange for notes or rupees and to give rupees for foreign exchange, that is, the liabilities absolute and converse, do you see any way in which the Bank could manage it?—(*Mr. Brent.*) No, if conversion were possible, the conversion of rupees and notes.

3156. That would depend upon the maintenance of an adequate reserve?—Exactly.

3157. Now that raises another point. You deal in your memorandum with a gold standard and a gold currency. You say if gold can be made to circulate it will have a greater stabilising effect on internal prices. There are two questions there. That recommendation of a gold standard is made upon the supposition that gold can be made to circulate. Will you, from your long and wide experience of the currency habits of the country, tell us whether gold could be made to circulate, and, if so, how it could be made to circulate?—I don't think anybody could tell you that.

3158. You don't think it possible to give an answer to the question?—I don't.

3159. Then you are not so confident that the result of the introduction of a full gold standard would be

* Appendix 16.

to increase the circulation of gold?—Well, we have said in our evidence that we think at the beginning it might not have that effect but ultimately we feel it would have the effect of increasing the circulation. But I do not see how it could be more than conjectural; it must be a guess.

3160. What influences do you think would be at work to increase gold in active circulation under your proposals? If I may make my question a little clearer it is this. Gold has been available for circulation in the past, but it has not gone into circulation. In view of that experience the question suggests itself, is it more likely to go into circulation in the future?—In certain districts in India where it was in circulation it was freely acceptable.

3161. That was in the Punjab, was it not?—Yes, mainly.

3162. Were there any other districts?—Yes, in Kathiawar; indeed it was at a premium.

3163. I understand that if gold is freely available it might return into circulation in those parts?—Yes.

3164. Basing your answer generally on your experience in the past?—Yes.

3165. The second question raised by clause (b) is why should gold have a relatively greater stabilising effect on internal prices than a purely rupee currency working under a gold exchange standard, if I may ask you to make the supposition that the value of the rupee in gold has been stabilised under an exchange standard system? In both cases the gold value of the rupee is stable, that is, making the assumption that I have asked you to make; and, if it is stable in both cases, why does the fact that in one case gold is in circulation and in the other it is not have any greater stabilising effect on internal prices?—I think the fact that the gold is available and freely exchangeable in these districts would have the effect of stabilising internal prices; that was our feeling; our feeling was that at present internal and external prices were not running concurrently, and they might not do so even under a gold exchange standard, even though the rupee was stabilised in terms of sterling.

3166. Supposing that, as at present, there is a discrepancy between internal prices and external prices, would it not be the case that, after the gold value of the rupee had been stabilised under any system for a certain period, that discrepancy might be expected to have disappeared by adjusting itself? Is not that only a temporary discrepancy due to the fluctuating gold value of the rupee?—I do not think altogether, Sir, if it was felt that gold was always available in exchange for the rupee, I think it would create a difference.

3167. Let me now pass on to clause (c): "They feel that a gold currency, divorced from hoarding influences, would be more easily capable of contraction than a rupee currency, inasmuch as rupees are neither exportable in the same manner as gold, nor meltable without loss, and this capacity for contraction should have the effect in the long run of producing greater stability." In the first place, could you amplify a little what you mean by a gold currency divorced from hoarding influences? Is that divorce a natural result of the introduction of a gold currency, and if so in what manner does that follow?—We meant there that in course of time, as gold became freely available, the tendency to hoard it would be less; at the present moment if there were a gold currency the tendency would be, we think, to hoard it; but in the course of time we think that would go owing to the mere fact that the people would feel that gold was available whenever they wanted to have it.

3168. I will ask you a question or two about that a little later on; it really refers to circumstances which you mention lower down. As regards the capacity of contraction, you said the rupees are neither exportable in the same manner as gold nor meltable without loss. But rupees, although not exportable in the same manner as gold, are convertible into a foreign exchange and withdrawable from the currency upon conversion; and, referring back to an altered and, it may be, perfected system of the exchange standard to which I have referred, in which the exchange standard would be based upon a united reserve in the hands of the Imperial Bank, might not a currency under such an exchange standard system as that be as automatically contractible as under a full gold standard? The improvements to which I am referring are the combination of the two reserves into one, accepting the liability for the conversion into foreign exchange of the rupee currency, and then the transference of the management to a Central Bank. Under a system of that sort would not the currency be as automatically contractible as it is under a full gold system?—It might be more quickly convertible, but I think we feel it would be difficult to get such a perfect standard as to make it automatically contractible.

3169. You think that, at a time of bad exchange, rupee exchange would come in to purchase foreign exchange; foreign exchange would come out; the reserves would be diminished; and the currency would be automatically contracted. Would you see any greater advantages in the automatic contractibility under the gold standard than under that method to which I have briefly referred?—I think we should prefer to see actual export and import of bullion.

3170. If I may try and bring out the weight of your evidence, I believe you are relying upon the circumstance that, under the gold standard, there are less opportunities for interference with the working of the standard?—That is so; that is at the back of it all.

3171. Is any standard proof against violent interference at times of great stress and pressure, and have we not known during the war full gold standards breaking down lamentably?—Yes, Sir; that is certainly true.

3172. Now, referring to your clause (d), do you consider that the use of cheques can be introduced to any appreciable extent in the foreseeable future in the great mercantile towns?—I think it could, Sir, as more confidence is created in the banking system.

3173. That could only come through confidence in banking. Do you consider that the full gold standard would directly tend to produce increased confidence in the banking system, or does that depend upon other and more numerous considerations than any question of the standard of currency?—Yes; we do definitely feel that if gold is always available in return for cheques, there would be greater confidence.

3174. Just to test whither that is leading us, which do you consider to be a stronger influence in promoting public confidence in banking in India, the nature of the currency system or the stability of the banks themselves? Might it not be said that what is really needed as regards the education of the populace in these great mercantile towns is the production of fundamental confidence that a bank is a stable institution which will pay a debt, and that, in comparison with that, any atmospheric influences as to the currency may not be of so much importance?—(*Mr. Brent.*) That is essentially so, Sir, but that point of the question we are leaving out altogether. We are assuming that the stability of the bank is without question if they encourage banking habits among the natives of India and our assumption is that, if they were able to draw cheques and get gold that it would be a distinct encouragement towards banking in this country. (*Mr. Grantham.*) I would amplify that, Sir, by saying that I do not think the native of India in the outlying districts does appreciate in any way whether a bank is strong or whether it is not strong. He may gradually gain confidence in a particular bank by the fact that cheques are always paid by that bank, but I think he would mainly judge it by the fact that he could get either gold or silver in exchange for his cheques, preferably gold.

3175. Now, as to clause (e), your committee feel that more actual gold would be imported into India under a full gold standard currency. That would no doubt be a feature of the period of transition to the gold currency, but are you of opinion

that that would be a permanent feature of the full gold system?—(*Mr. Brent.*) Well, it would be unnecessary, Sir, once the gold standard were established and gold circulating freely.

3176. It would be unnecessary undoubtedly, and, therefore, perhaps it would not take place—a permanent increase?—It is a transition period.

3177. Will you explain a little more carefully the following statement:—"This would automatically ensure the accretion of greater real wealth in terms of the world's standard of value." How would it ensure the accretion of greater real wealth? Is gold real wealth?—(*Mr. Grantham.*) At present, Sir. Our impression is, as long as gold is the world's standard of value, that it does represent real wealth.

3178. It represents wealth as a store of value, I take it?—Yes.

3179. And it has a use in the arts, but otherwise is gold more real wealth than anything else?—I think it is to the Indian, Sir. It is certainly more readily exchangeable than other produce.

3180. It is a commodity which he greatly desires as we understand?—Yes.

3181. His desire is for gold for ornaments and for hoards?—(*Mr. Brent.*) For hoarding and for ornament, of course.

3182. Are those uses of gold which you desire to promote?—(*Mr. Grantham.*) No, I think the reason we wished to promote it was that it was the world standard, and at present India has got comparatively little in actual use.

3183. I understand you are not really advancing the view in this paragraph that the wealth of India is to be measured by the gold she can get?—Not entirely, Sir, by any means.

3184. On clause (*f*), the question I desire to ask is this. The rural population prefers gold to silver, that is, you tell us they prefer gold for hoards and for ornaments. In your opinion does the rural population really prefer gold to silver as currency?—I think there has been an increasing use of it, Sir, in quantities. Very small portions of gold are sold now in up-country districts.

3185. For active currency?—They are used to some degree as currency in that a ryot takes a small lump of gold and hands it back to his bania in times when he wishes to purchase something; especially in the cotton districts we have witnessed that.

3186. Is it or is it not a feature of the psychology of the uninstructed Indian public that they base their sense of currency values principally upon the rupee?—They see more rupees than gold, but I do not think they would prefer silver if they could afford to get gold.

3187. Is it not the case that the vast bulk of currency transactions are of such a magnitude that gold is not a suitable medium for exchange?—I am not sure that I appreciate the question.

3188. I mean, for the little buying and selling connected with the ryot gold is no good to him for that purpose?—Not for petty purposes.

3189. Paragaph 6, I think, needs a little elucidation. You state that "in Europe it is considered uneconomical to dissipate gold reserves in actual currency, but that India cannot be judged solely by western standards." I take it you do not mean that it is any less uneconomical in India than elsewhere?—(*Mr. Brent.*) No, Sir, we have emphasised that fact later on in the report—the question of economy—that it is much more expensive.

3190. The weight of this paragraph is that other considerations, such as the preference which you referred to, should be weighed against the cost?—Well, hardly weighed entirely against the cost. I think other considerations should be weighed against the cost, I think you will find from our report that the question of a pure gold standard is to us more or less a pious hope.

3191. I was trying to ascertain the piety of the hope. Assuming, as stated in paragraph 7, that a gold currency is introduced, I understand it is your opinion that this would result in an immediate increase of the tendency to hoard?—Yes.

3192. But that you anticipate that that tendency would correct itself in course of time, and that the reverse result would be produced?—Yes.

3193. From your knowledge of Indian conditions and the rate at which public opinion can alter in this country, can you give us any idea at all—(I do not mean within five years even)—as to the order of time which would be required for the reverse action against hoarding?—Well, Sir, that depends entirely upon the rapidity of the transition period. I mean it is a question of familiarity. You cannot expect the reverse to happen until it has become so familiar and so possible that the Indian can obtain gold whenever he wants it.

3194. You can only say that the tendency to hoard would continue until the public was thoroughly familiarised with the fact that gold was always freely available against their rupees and notes?—That is so.

3195. Perhaps you would rather I did not ask you to commit yourself to any sort of rough statement for the assistance of the Commission as to what order of time would be involved—5, 10, 50 or 100 years?—I do not think so.

3196. What would be the effect of the rendering of gold freely available in return for rupees and notes upon the holdings of silver hoards in the country?—(*Mr. Grantham.*) They would exchange them, I think, to some degree.

3197. Have you been able to form any estimate, however approximate, as to the amount of rupees which are held in hoards in the country?—(*Mr. Brent.*) No, we have not, and that is one of our principal reasons for finding no solution to this question of conversion during the period of transition.

3198. Perhaps I might suggest that we should assume, for the purposes of our further questions, an estimate of some 150 crores of rupees held in hoards in the country. I understand you would rather not express an opinion whether that estimate is right or not. If you will very kindly assume it just for the purposes of our next few questions, do you look upon it as impossible, or indeed improbable, that the result of making gold freely available in the manner described might have the effect of bringing out the whole of these hoards in a very short period?—(*Mr. Grantham.*) I do not think we could give an exact answer to that question, Sir, beyond saying that we feel that a very large percentage of the silver hoards would come out.

3199. You think that a very large percentage would come out in exchange fairly quickly?—I think so. I think that would be the tendency.

3200. At any rate, we need not try to ascertain the possibilities too closely; we need only say that there is a possibility?—Yes.

3201. If we assume that figure which I have given to you, and assume throughout the period for the conversion of silver rupees into gold, including hoards and the Government silver reserve, a total sum of 200 crores—(I am asking you again to be kind enough to take that figure from me)—we arrive at the conclusion that, in order to bring a full gold standard into final full operation, you require an amount of gold approximating to 100 million sterling. Will you tell me what your view is as to the effect of the withdrawal of that amount of gold from the world's supplies to India?—I am not prepared to attempt to do so, Sir.

3202. You would not perhaps be prepared to go further than to say that it is a circumstance which would require serious consideration?—(*Mr. Brent.*) Very serious consideration.

3203. Would that be because of its possible effect upon world gold prices reacting upon the welfare of the Indian nation?—Yes.

3204. One question regarding the cost of this scheme. If I may ask you to make a further assumption, that the recurring cost to India of the introduction of a full gold standard would be about a crore and a half per annum during the transition period and about a crore and a fraction per annum thereafter, what weight would you attach to the disadvantage of this expense against the advantages of the system as you have described it?—But you said just now, Sir, a crore and a half per annum during the transition period—transition of what period?

3205. Five years, and then a crore and a fraction? —(*Mr. Grantham.*) For so long as it was in operation?

3206. For ever; a permanent addition to India's debt. I just want to see what relative importance you attach to these considerations?—I do not think I should be prepared to answer that without consideration of the figures.

3207. Of course I am not asking you to accept those figures as your own evidence. I am only asking you to make that assumption. As a matter of fact we have had evidence suggesting that that would be the cost of the scheme, and I thought it would be of assistance to the Commission if you could tell them, reducing to an arithmetical figure the annual cost of your scheme, whether you would consider that to any extent such a cost as that would or would not outweigh the advantages of the scheme? —It is rather difficult for us to give a reply at all to that without giving further consideration to the figures. My own impression, Sir, is that it would justify the cost even at that expense because of the ensured stability of the system but I think Mr. Brent is of opinion that the cost would not be justified. Of course as this question has not been considered by my Chamber, this opinion which I have expressed is my own personal opinion.

3208. Now, continuing on paragraph 8, you refer to the possibility of the gold in circulation being available for the support of the external value of the rupee. Is it not a general experience that gold in circulation is not readily available for export in times of weak exchange?—Not readily—yes, Sir.

3209. How much reliance would you place upon the gold currency in circulation as a support for exchange in times of crisis?—Your question was, if gold currency was in full operation.

3210. Yes, proceeding on the basis of a full gold standard?—I think if there were a full gold standard in full operation, the probability is that it would be forthcoming.

3211. You recognize, do you not, that it is only required in times of crisis?—Yes.

3212. Is it not common experience that, in times of crisis, the strongest instinct on the part of the uninstructed public is to part with any other form of currency medium sooner than part with their gold?—It is really a question, Sir, whether the circumstances would be such as to compel the public to part with their gold. If the balance of trado was against India for two or three years, the probability is I think that they would have to part with their gold. They would have nothing else to part with if gold was in actual currency, however much they wanted to hold on to it.

3213. In your opinion then not much weight is to be attached to the suggestion that in times of crisis, although the public may in the last resort be obliged to part with gold, they would sooner part with anything else?—I think that is so, Sir.

3214. In paragraph 9 you say you feel that it would be unsafe for Government to accept the full responsibility for the conversion of rupees into gold without in some way limiting tho issue of silver rupees. What form of limitation had you in mind? —We had in mind the curtailment of the total gross issue, just a cessation of issue of further rupees.

3215. Would you explain a little how that would relate to the special demand in India for rupees for the movements of certain crops at certain seasons. Must there not always be a certain amount of fluctuation in the total demand to meet these seasonal crop movements in dealing with the expansion or contraction of the rupee circulation according to the season?—We were assuming that gold would be used in support of silver as it has been in the past for the finance of these crops.

3216. That is the question on which we should like to have the benefit of your experience. Is it not the case that there are certain crop movements which, owing to the nature of the payments made and the habits of the cultivators, can in practice only be financed by rupee silver coin?—I do not think so now, Sir.

3217. Is it part of your proposal that, either concurrently with or after the introduction of the full gold standard, the rupee should be limited as legal tender?—No, Sir. We have not come to that conclusion. In fact I think it would be impossible to do so.

3218. Would you amplify a little the answer you have given. In what do you find the impossibility of limiting the rupee as legal tender?—It is in such very general use and in such large quantities that I do not quite see how one could limit its legal tender beyond a certain figure. I take it it would be quite a small figure if one created a limit at all.

3219. Then you base your opinion as to the impossibility upon the habits of the people as regards the use of the rupee?—Yes. I think they will have to be educated in the use of something else for a considerable period before it would be possible to consider anything of that sort. Even then I am not sure they will not want their rupees in some form.

3220. What you have just said tends to show that much gold would be likely to go into the popular reserve?—I think that it would go very slowly into circulation, not quickly.

3221. And I imagine you would reply that you should not limit the legal tender of the rupee until it had been substantially replaced by gold in circulation?—That is so, Sir.

3222. What evil consequences would you fear from the limitation of the legal tender of the rupee before the attainment of that period?—There would be nothing to take its place.

3223. It would be impossible to do that without at the same time offering, as we are assuming, the free substitution of gold for rupees?—At the beginning the free substitution of gold would not be accepted universally in India. It would take time for the substitution to be accepted.

3224. So that, even though you accepted the liability to substitute gold for rupees, the people would not take gold against their rupees and they would be left with the silver currency, which, as its uses have been limited by law, might be at a discount? In other words, you would be diminishing the store of value which they hold in the form of rupees?—I think the rupee is too much a standard of value to abolish it or to attempt to limit it except in the manner we have indicated.

3225. In paragraph 11 of your memorandum, in which you say that you appreciate the many and obvious difficulties in the way of the immediate attainment of that object, that is, a full gold standard, you recommend during the transition period a gold exchange standard and the creation of sufficient gold reserves in India for the attainment of the full gold standard. Could you amplify that a little by telling us in what manner you would provide for the accumulation of gold reserves against that day of the full gold standard?—You mean in what particular reserve it would be accumulated?

3226. Any suggestions would be of interest as to the mechanism by which the gold reserves might be accumulated?—Our suggestion was to accumulate gold in the paper currency reserve.

3227. What would be the nature of the operation?—It would be the issue of notes against gold, or, in course of time when the melting down of rupees is bound to occur, their replacement with gold.

3228. You would replace existing silver reserves by gold by selling the silver?—Yes, slowly.

3229. And for future increases of currency you would require gold for the issue of notes?—Yes.

3230. Would you also sell the existing sterling securities in the reserves?—No, not at first. The first operation would be the provision of gold in the paper currency reserve.

3231. In the course of time you would sell the sterling securities?—Yes, in course of time.

3232. Has it been possible for you to make any estimate at all of the period which would be required to accumulate the gold necessary for the safe introduction by these methods of the full gold standard?—No.

3233. I imagine you would reply that the period must be long enough to accumulate the necessary gold?—Yes.

3234. (*Chairman.*) It would be convenient at this stage if members asked any supplementary questions on the ground covered.

3235. (*Mr. Preston.*) Mr. Grantham, with regard to your last reply to the Chairman on the question of the acquisition of gold with a view to the ultimate bringing into force of a gold standard, the interest earned on the gold standard securities and on the securities in the paper currency reserve is I think about 2½ million sterling. If the interest was collected and was converted into actual gold and shipped to this side and we were to give a period of say 20 years, you would accumulate gold on this side of £50 million sterling. Would that meet with your approval?—Do you mean that you concurrently keep the gold exchange standard in London absolutely intact as it stands to-day and the securities in the paper currency reserve intact.

3236. The interest to date in so far as the gold standard reserve really was concerned under the old régime ought to be added to the gold here so that the gold standard was increasing. That method is not followed. I have assumed that that interest as collected is converted into actual gold; the interest also on the sterling securities in your paper currency reserve is converted; and assuming that the amount would be about £2½ million sterling actually converted into gold each year, there being thus no great drain on the gold reserve in London and that gold is shipped out to this country, in 20 years you would have a gold reserve of £50 million sterling?—I think I am right in thinking that the interest at present goes to the general revenues.

3237. I am not sure whether it really goes to the general revenues. Really speaking, the interest on gold standard ought to go to the gold standard, under the old ruling?—But at present it goes to the general revenues.

3238. (*Chairman.*) That is so.

3239. (*Mr. Preston.*) I believe that is so?—So that the cost of the creation of the proposed gold reserve fund would be a direct cost on the revenues of the State to be wiped off in 20 years.

3240. What would it actually cost you?—Without being able to give the matter further consideration, I think that would be too costly a method.

3241. (*Sir Maneckji Dadabhoy.*) There is a great sentiment in the town of Bombay in favour of gold standard. Is there not?—There is, yes.

3242. And is that sentiment shared by the European commercial community in Bombay as well?—Yes, our evidence is to that effect.

3243. (*Chairman.*) Your evidence is that the opinion of the Bombay Chamber of Commerce is to that effect.

3244. (*Sir Maneckji Dadabhoy.*) I am talking of the general commercial community. My question related to the sentiment in Bombay and the next question was whether that sentiment was shared also by the European commercial community?—In so far as the Members of the Chamber of Commerce are concerned, yes.

3245. The introduction of a gold standard in order to be effective must be introduced as rapidly as possible. That is so?—It is no use delaying it too long. I mean, spreading it over a long number of years, you will lose its importance or efficacy. The transition period, I am speaking of. Is it not so?—I think in answering that, we have to consider the question of cost as well. We should not be prepared to recommend the conversion into gold irrespective of cost, even though it might be admitted that the more rapidly it could be effected, the better.

3246. But even if it may cost a little more at the outset, would it not amply repay at any time that cost if it is done more expeditiously, I mean the introduction. That is, though the initial cost may be great, would it not amply repay?—It is rather difficult to answer that without having some idea of what the cost would be of introducing it rapidly. I have already replied to Mr. Preston's question. I think his suggestion might be rather costly, to build up a reserve of 50 million in India out of the general State revenues in 20 years.

3247. But any scheme would involve more or less cost. Have you any scheme to suggest which would involve the country in a less amount of cost?—We have no rapid scheme. The whole of our evidence is to the effect that it will have to be very slow, I mean the conversion.

3248. What is your serious objection to the question put by my colleague, Mr. Preston, with regard to the gold securities as well as the paper currency securities? What is your actual objection to that?—Our actual objection is purely one of cost, that the cost of that fund would be paid for by the State every year, instead of the fund being built up by automatic imports of gold.

3249. Will it be charged to revenue in that case?—The cost?

3250. Yes?—It must come out of the revenue. At present the interest on those funds goes to the revenues of the State.

3251. Have you any definite ideas regarding the amount of gold that would be necessary to accumulate to meet the demand at the outset?—No.

3252. Could you make any guess?—No, I could not answer that.

3253. Do you not think that the demand for gold now in exchange of the rupees is mainly due to the sentiment prevailing among the people that if they part with their gold, they will not be able to replace it immediately in times of dire necessity, and it is much better to hold gold as Government will not part with gold? Is not that the feeling which is underlying a demand for the hoarding of gold?—I am not quite sure that I understand that question.

3254. At present people hoard gold because they think that once they part with their gold, it would be difficult to replace it, because they will not get it back?—I do not think that I would attribute it to that reason. I would rather say that it is a more expensive metal and they recognise it, and as such they would prefer it if they could afford it.

3255. Probably I may tell you why I ask you this question. If the gold standard is introduced, people will understand that they can at any time at will, obtain gold for silver, while at present they know that the Government is under no obligation, and as a matter of fact, Government does not give gold for silver. Now the very fact of the introduction of the gold standard, would it not make a change in the sentiment of the people? And ultimately even in the transition stage you would not require so much gold?—We have already said that. We have said in our evidence that hoarding will gradually cease although it would in the first instance increase. But the ultimate effect would be a gradual cessation of hoarding.

3256. That is, confidence will be restored in the general public in the currency of the country?—Yes, people, I think, will never hoard so freely what they can freely obtain.

3257. Quite so. Is there a great deal of hoarding in the town of Bombay?—I should say there is hoarding; yes.

3258. Confined to what communities mostly?—I think one might say that the less educated people hoard more than the educated people. All the mill workers, for example, servants and others, have their gold or silver hoards in some form or other, whether it be necklaces or bangles and I suppose the bigger Marwaris also hoard.

3259. I should have thought that in a commercial city like Bombay, where money is constantly required, there would be less of hoarding than in any rural district?—That is quite possibly correct, but your question was whether there was hoarding in Bombay.

3260. To any appreciable extent?—It is very difficult to say.

3261. In paragraph 10 of your memorandum while discussing this question, you say, "My Committee are inclined to the view that the sovereign is too large a coin to circulate freely in India and they would prefer to see a smaller coin minted in India." What coin do you recommend?—A ten rupee coin.

3262. Ten-rupee gold coin?—Yes.

3263. Why do you recommend a small coin?—Mainly because the fifteen rupee coin as one of larger value might not be so easy to circulate. The ten-rupee note does circulate very freely.

3264. Has there been any difficulty experienced in the circulation of the sovereign in Bombay?—I do not think we had sufficient experience.

3265. You had not sufficient experience?—And the whole of this question is one of popularising a coin in order to make it circulate.

3266. Do you think that such an idea would be favourably received by the commercial community, I mean the trading community, who are generally accustomed either to a fifteen rupee sovereign or a gold mohur of a bigger denomination?—We were looking more from the point of view that it was necessary to find a gold coin that would circulate and be popular with the people of the country and bearing that in mind, we felt that a ten rupee coin would be more popular than a fifteen rupee coin.

3267. There would be no misgivings about a new coin being introduced?—That I could not say.

3268. There won't be any distrust about it?—I do not think there would be any distrust, once the people find that the Banya or the Marwari would take the gold coin and the contents of the gold were correct.

3269. (*Sir Maneckji Dadabhoy.*) Are there any special reasons; I mean as I understand, in the Dominions and other places, they have not got their separate coin, I mean gold coin, sovereign. Are there any special reasons in India from departing from this practice and in fact causing a severance in the link in a sense between Great Britain and India by having a new gold coin introduced in this country?

3270. (*Chairman.*) The witness said that the sovereign was too large a coin.

3270A. (*Sir Maneckji Dadabhoy.*) I am now putting the general question whether there are any special reasons, apart from that, for departing from the general practice?—No special reasons; nothing apart from that one primary reason that the smaller coin would be a convenient coin for circulation.

3271. Only on that ground? But I understood you to say the circulation of the sovereign was not sufficiently long enough to form any real definite opinion?—That was in Bombay. But apart from that, I do not think a fifteen rupee note would circulate as easily as a ten rupee note upcountry and that is vhat we had in mind. We were not considering the matter merely from the point of view of the city of Bombay.

3272. Asked about the banking system by the Chairman, you said that it was difficult really to find a banking system in India, perfect in itself and of such a magnitude and with such ramifications as to be a real potentiality in the country, at least if it is woiked for some years more?—For some years, yes.

3273. Considering the sentiments and the habits of the people?—Yes; that is so.

3274. (*Sir Henry Strakosch.*) Rather an important question is raised by the problem as to whether gold put into circulation is available in case of need for external payments. You mentioned, I believe, that you thought if there was a failure of crops, gold would naturally flow back and would therefore be available for export and therefore for external payments?—Yes.

3275. Now quite apart from that possibility there are other types of crises which one has to contemplate?—Yes.

3276. For instance, an internal crisis, a credit crisis, an external crisis, which would result in withholding the usual credit facilities to India, and then a combination of all three. Do you in all cases believe that the gold in circulation will be available for export, and therefore for stabilising the exchange?—Not in all cases, no.

3277. You would, therefore, say that apart from the gold in circulation there must necessarily exist a reserve to maintain the external stability of the rupee?—There must be some form of reserve, yes, which would be readily available.

3278. How big do you think that reserve ought to be?—I am not prepared to express any opinion as to the exact figure.

3279. Well, would you say it would have to be smaller or bigger than the present reserves?—Yes, without committing ourselves, I should say bigger.

3280. In other words you would need, in order to introduce a full gold standard with gold in circulation, the gold necessary to replace hoards, the gold necessary to form a medium of exchange, and on top of that a gold reserve sufficient to maintain in times of crisis the exchange value of the rupee?—When you say sufficient to replace hoards, do you mean the complete hoards of India or a portion of the hoards?

3281. Well, I should like to have your view on that?—We have not considered, Sir, the question of the total reserves that would be necessary. I do not think that in any case we should answer that it would be necessary to keep a reserve to cover the total liabilities under all three headings you mention. It would necessarily be only a percentage of those three liabilities.

3282. But would you explain why it should be a percentage and what percentage you have in mind?—I do not think I should be prepared to come down to the actual figure because we have not considered it, but what I meant was it would not be necessary to provide a gold reserve sufficient to replace the total hoards in India. I do not think the total hoards would be likely to come out, for example.

3283. You have no idea as to what amount is likely to be needed?—No.

3284. But, any way, you admit that there are these three points which have to be considered and have to be assessed before one can fairly commit oneself to so big an undertaking?—Yes, I entirely agree with you, Sir.

3285. Now I believe you mentioned before that you thought the bulk of the gold needed to establish a gold standard of that character should be imported through private channels. Did I understand you correctly?—Yes.

3286. Well, if you did introduce a gold standard with gold in circulation, I take it the Government would have to agree to give gold in exchange for rupees and for notes?—Ultimately, yes.

3287. The gold needed for that purpose will have to be provided by Government?—Yes, it will have to be provided out of their reserves.

3288. And it will have to be provided before they can possibly hope to sell the silver contained in the rupees that are flowing back?—(*Mr. Brent.*) Our idea was that it could be concurrent, that silver could be slowly sold and replaced by gold, not necessarily that the gold reserve would be fully accumulated before any sales of silver were made.

3289. But if you appointed a date which you would no doubt have to do from which onwards the Government would be prepared to give gold in exchange for rupees, do you think it would be prudent not to have accumulated a very substantial amount of gold to meet any demand for gold in exchange for rupees?—Of course; it would be impossible to do otherwise.

3290. Exactly. Therefore, you would have to keep a very substantial reserve available for that purpose?—Yes.

3291. You were saying, in answer I believe to Mr. Preston, that you did not like the idea of accumulating the interest accruing on the gold standard reserve securities for the purpose of building up a gold reserve. By what other process would you suggest that the gold should be accumulated?—(*Mr. Grantham.*) Wo take it a certain amount would be tendered in exchange for rupees to the Currency Office. The balance would have to be purchases of gold in course of time, I admit, by Government.

3292. Would you say that on introducing a gold currency in this country the note circulation would increase or decrease?—The whole question depends on whether it will circulate. Our opinion is that the note circulation would decrease.

3293. Now would you admit that if the note circulation were to decrease, that would produce a lesser elasticity in the whole currency system?—From what point of view.

3294. Well, if you issue notes on the basis of gold and, let us say, commercial bills, that kind of note currency can be expanded, and will expand in accordance with the real needs of the country for currency. If the note circulation decreases, to that extent the elasticity is lost because then you would only be able to get an increase in the circulation if further gold were imported from abroad, which of course depends upon the foreign trade of the country?—I think that is what we should like to see, the total circulation of currency expanding or contracting in direct relation to the foreign trade of the country.

3295. And, therefore, that the note should not remain as popular as it is to-day?—No, I do not quite say that. They would remain as popular; but surely there must be some decrease if gold is coming into circulation.

3296. But I understood you to say that, if gold were put into circulation, you would expect the note circulation to decrease?—Yes.

3297. Just one other point. Have you thought of the social and political effect of a very heavy drop in the price of silver concurrently with the possibility of a heavy appreciation in the price of gold, which means, in other words, a fall in commodity prices?—You have in contemplation the necessity of Government selling their silver?

3298. As it will have to do in order to provide the necessary gold?—I do not think, Sir, we can say we have considered the actual definite effect of the sales beyond our general statement that it would have to be a very slow conversion. That is why we have stated throughout that we would not favour a quick conversion into a full gold standard.

3299. But how could you control the pace at which the conversion should take place?—(*Mr. Brent.*) By regulation during the transition period.

3300. Let us take the moment when you give gold in exchange for rupees?—(*Mr. Brent.*) Yes, but we have not arrived at that yet. (*Mr. Grantham.*) That would be the end of the transition period.

3301. We have to contemplate that period?—(*Mr. Brent.*) Yes, but the reduction of the silver reserves; the conversion of the silver reserves into gold depends entirely on the method in which you propose to transact business during your period of transition. I mean to say, we do not contemplate for one moment that the whole of the silver reserves of India should be thrown on the market and realise whatever price they can in gold.

3302. Let me put it to you in this way. During the transition period silver rupees and notes will circulate as they are doing to-day; they will have to continue to circulate during the transition period because there is nothing else to take their place. Now when the transition period is over, will there be sufficient gold available?—We are assuming that sufficient gold has been built up in the reserves here to enable you to start converting.

3303. Yes. Now to acquire that gold you will have either to impose taxes, in which case the cost of that gold will be met out of revenue, or you have to contract a loan. But when you do offer to exchange gold for rupees, do you not think that the market, long before that happens, will anticipate there is a great deal of silver to be sold, and that the silver market will suffer a very severe depreciation?—It depends entirely on the method of selling. I mean to say if the sales are protracted over a period of years there is no reason why that should seriously affect the silver market.

3304. You do not think the market would anticipate that?—Indefinitely?

3305. I do not say indefinitely, but at that time, as is usual I think in all markets, markets usually discount events?—It depends entirely on what basis, what time-limit there is on the event. If a thing is likely to happen within the next year or two years.—Granted that is so. But if you have got a period, a very long period; we have no idea of what your transition period will be, but if we say for argument's sake it will be 20 years, do you think that is going to have a serious effect on the silver market immediately?

3306. I should like to have your views on that?—My personal view is that if the transition period is going to extend over a period of 20 years, it will not have any immediate effect on the silver market.

3307. Then you do not think silver hoards will come out in anticipation?—They might possibly to start with thinking they were going to realise prices before the Government of India started to sell; but I think they would be disappointed when they found nothing happened within 12 months or 18 months.

3308. So you anticipate nothing would happen in the silver market?—I do not think so, provided that the period in which these sales were carried out is sufficiently long.

3309. Now one other point. If the absorption by India of a large amount of gold does have an effect upon the purchasing power of gold, that would obviously affect Indian prices as it would the prices in any other Gold Standard country?—I think the same answer applies as in the case of silver. It depends on how and when the Government of India are going to buy their gold.

3310. It depends on how gradually it was done, and you propose to spread that over a period so as not to inconvenience the world?—That is the whole idea.

3311. Thank you; I have nothing more to ask.

3312. (*Sir Reginald Mant.*) Mr. Grantham, in paragraph 11 of your memorandum you recommend that a gold exchange standard should be in operation during the transition period. In paragraph 12 you say that during that transition period Government should undertake to convert rupees into gold or sterling, at their option, on demand. Is not that practically a sterling exchange standard and not a gold exchange standard?—It is, if the option is given, yes; but we recommend that in view of the fact that Great Britain is now on a gold standard herself.

3313. Therefore in using the term "gold exchange standard" you are basing it on the supposition that sterling will remain equivalent to gold?—Yes, that is our supposition.

3314. Do you contemplate that Government should also undertake to give rupees for gold?—Yes.

3315. During the transition period?—Yes.

3316. But you say that it would be necessary to fix both high and low gold points. I presume that

sterling would be freely purchased or council bills sold below the gold point, so there would be no inducement to people to import gold to obtain rupees? —No, there would be no inducement.

3317. So the Government would not, under that system, automatically accumulate gold reserves except by sale of silver?—It does not follow that there would be no gold imported; there would be imports of gold in spite of this system.

3318. For presentation to Government to get rupees?—Yes.

3319. I am assuming that it was cheaper for people to buy council bills or to sell sterling in order to obtain rupees. So long as you buy sterling below the gold point, what inducement is there for those who want rupees to import gold in order to obtain them? —(*Mr. Brent.*) That is simply a question of meeting trade demand, Sir.

3320. I do not quite follow?—I mean to say the importation of gold into this country is not necessarily dependent entirely upon the parity of gold between India and London or New York.

3321. We know that there may be large imports of gold; gold is being imported at present, but I want to know what probability there would be in the future of its being imported for presentation to Government in order to obtain rupees. Really I want to know what probability there is of Government accumulating a store of gold in that way under the operation of this sterling exchange standard?—(*Mr. Grantham.*) I do not see how I could give a definite answer to that, or say that a certain amount of gold would be imported; it must depend on trade conditions.

3322. Could you give us any information as to what happens to the gold that is being imported at present? There have been large imports of gold recently. Do you think that they are replacing silver rupees in hoards to a large extent?—(*Mr. Brent.*) I should think very probably.

3323. And do you think that process is likely to go on?—It depends on the price of gold very largely; if it is cheaper than silver. The native of this country undoubtedly prefers gold to silver as a form of hoarding; that is the idea that one has gathered from these very large importations that have taken place during the last two or three years.

3324. Assuming that the rupee is fixed, as you propose, at 1*s.* 6*d.*, do you think that that process will continue of gold replacing rupees in hoards?—It is very difficult to say; but the tendency would incline to lessen.

3325. Why?—Mere statistics of importations will prove that during the last few months in comparison with the same months of last year.

3326. That is rather a short period to take for purposes of comparison, is it not? Would it not take the market some time to absorb the imports of last year?—Yes.

3327. It is quite possible that there may be further large imports when that absorption is effected?—That is possible, yes.

3328. Loking forward for a period of years, do you think it is likely that the rupees in hoards will have been largely replaced by gold before the time comes for the introduction of your proposal for a gold currency?—That is a question that I should not like to answer or even to hazard a guess at. We have no knowledge whatever of the amount of hoarded rupees in this country.

3329. You do not think it probable that the store of gold in hoard will be largely increased in comparison with the hoards of silver?—It depends on the imports of gold to a certain extent.

3330. You cannot really give an opinion on that?—No, I could not.

3331. (*Sir Purshotamdas Thakurdas.*) Mr. Grantham, you said in reply to one of my colleagues on the other side that you thought that with gold in circulation note circulation would decrease?—Yes.

3332. Why do you think so?—Chiefly because the value of the note is closer to the value of the gold coin than to that of the rupee.

3333. Would those who take gold instead of notes use it for hoarding purposes?—I do not quite see the relation of that question to circulation.

3334. Nobody holds currency notes for purposes of hoarding; he holds that in the form of one or other of the two precious metals. Therefore whatever currency notes are in circulation are in active circulation. Why should that go down because there is gold currency available instead of silver coin?—I do not quite agree that currency is not hoarded in notes; I think a certain amount is hoarded in notes.

3335. You think there is hoarding also of currency notes?—I think so, yes.

3336. A very small amount?—Comparatively small; but still it is there.

3337. You think that should be taken into consideration for purposes of conversion when gold currency is put into circulation?—No; I should not call it a serious factor.

3338. Except for paper currency which may be hoarded, there is no reason why the paper currency should decrease when gold is in circulation?—It is a very moot point; but my impression is that the note would be replaced by some degree of gold if gold circulated.

3339. I think Mr. Brent said in reply to the Chairman that notes are sent up-country instead of bullion to move crops lately. Did I understand you correctly?—Yes.

3340. Could you give us an idea approximately of the increase in percentage of notes sent up-country from Bombay to move crops instead of silver bullion? —Do you mean direct from Bombay or from up-country banks?

3341. (*Sir Purshotamdas Thakurdas.*) I do not know what Mr. Brent had in mind.

3342. (*Chairman.*) We can get that from the statistics of the seasonal expansion and contraction of the note issue.

3343. (*Sir Purshotamdas Thakurdas.*) I thought Mr. Brent had some particular figures in mind?—(*Mr. Brent.*) It was only an answer to the question whether notes had replaced rupees to any extent in connection with the payment for crops; but as to what the actual amount is, I think nobody will be prepared to say. The mere fact is that notes are sent in payment of crops now, whereas in the old days it used to be necessary to send actual hard cash.

3344. And this popularity of currency note has been more in evidence since the outbreak of the war perhaps?—I should say undoubtedly.

3345. And the small one-rupee note was very popular before it was discontinued?—It was.

3346. In fact the discontinuance of it has been a source of complaint from many people, I am thinking more of the districts, not of the cities?—Yes; I should say so.

3347. In spite of that, if it is known that in exchange for paper one cannot only get silver but also gold, do you think paper would be more unpopular, or would you think it would be more popular?—More popular if you can get gold for it.

3348. Therefore I wonder if Mr. Brent would like to modify his reply a little when he said that with gold in circulation paper currency notes may decrease?—I think the answer to that question is the ratio of circulation of gold and notes, is it not?

3349. Would the ratio of notes come down from the present ratio?—It depends entirely on the popularity of gold circulation. (*Mr. Grantham.*) I think what we were getting at was this, that the gross circulation would be a fixed figure; if gold were introduced there would have to be a reduction in the note issue or silver, and we felt that notes would tend to decrease rather than silver. I do not see that that does not conform to Mr. Brent's answers. (*Mr. Brent.*) My answer to Sir Purshotamdas Thakurdas was that assuming the total issue to be a fixed figure the introduction of gold as actual currency would

cause a reduction either in notes or silver, and we felt that the reduction would come in notes rather than in silver.

3350. Do you mean at the start or, say, after six months after the people got convinced that they could get gold in exchange whenever they wanted?—At the start.

3351. Perhaps partly due to more curiosity and the novelty of the thing?—Yes.

3352. In reply to Sir Henry Strakosch, if I remember correctly, I think you said that gold in circulation may not return in all circumstances. In one of the paragraphs of your memorandum you say that gold in circulation is bound to return when oxchange falls owing to failure of crops (paragraph 8); but I think in further reply to a few of his questions you said that in all circumstances gold in circulation may not return. Could you tell me one or two instances in which case gold in circulation may not normally return to the treasury?—Yes; we were thinking of a crisis outside India.

3353. Not affecting Indian trade and commerce at all?—It would affect Indian credit.

3354. I mean if gold is in circulation or any currency is in circulation, it is bound to return, whichever is the largest proportion, is it not? If thero is a crisis outside which does contract credit here, which means there is a reflection of lower prices here, some of the currency has got to come back to the treasury?—I think our answer to Sir Henry Strakosch was that gold would be the last thing to return under those circumstances, not that it would never return.

3355. People would of course pay back the paper first, and the rupees if they had that; but when they have to pay back to the last point, they must pay up in gold?—Certainly.

3356. Therefore the return of gold would depend upon the proportion of the crisis?—Yes, on the actual urgency of the demand for the payment.

3357. You referred, I think, in reply to Sir Maneckji, to the fact that there was hoarding in Bombay and you referred particularly to the way in which the servant class held their ten, five or twenty rupees in cash and to the way in which they make ornaments with their savings. Do you really call that hoarding as it is referred to when the question of Indian currency and the amount of gold required is under consideration? Does not that represent the saving of that man?—(*Mr. Brent.*) Everything in a non-productive form is surely a hoard.

3358. There are two non-productive forms: one is ornaments and the other is cash. The ornament part is one which is guided more by social customs of the particular man or his community; for instance, a Hindu wife has to have a certain quantity of gold ornaments according to the present customs of the country—it may be right or it may be wrong, but the other is a cash sum which he could put into the savings bank and get a little interest, but which he does not; that is due more to the illiteracy of the people than to their innate taste for hoarding money in coin, is it not?—(*Mr. Grantham.*) That is quite correct.

3359. And it has nothing to do with his inborn taste to see gold or silver glitter in his own pockets? With education it would disappear gradually?—But surely he hoards more bangles or anklets than he need necessarily do under his family system.

3360. Would you call jewels and ornaments made with precious metals a form of hoard too?—I think it must be a hoarded form of wealth if it is out of proportion to the man's wealth.

3361. It is out of proportion when it is out of proportion to the minimum requirements of that person, having regard to his social customs?—Yes.

3362. Regarding the question of the banking habits of the people, you said in reply to the Chairman that the banking habits of the people would be developed faster if when they cashed a cheque they felt confident that they would get gold. Has the tendency of the people towards putting their money in banks anything to do with whether gold is available or silver?—You are referring to the up-country districts, not to Bombay?

3363. I think the Chairman's questions referred to the general banking habits of the people; but if you will you may divide it into two parts. if that would make it clearer?—Yes, I think, taking general up-country habits, it would make a difference if they knew that gold was obtainable.

3364. That means—I do not know if I am right, please correct me if I am not—that with gold currency the banking habits of the people would get a great impetus?—That is our impression.

3365. In reply to Sir Maneckji just now—Sir Maneckji used the phrase "sentiment of the commercial community of Bombay for the gold standard," and asked whether your Chamber shared that sentiment. I wish to ask for the purpose of record whether your Chamber have, in their written statement taken cognisance of what may be the sentiment of the Indian people but as far as your written statement is concerned sentiment has had nothing to do with it and you have gone on the basis of facts and figures, all the while taking cognisance of sentiments as they may exist among the Indian people?—Yes, that is so.

3366. There has been no sentiment underlying the evidence that you have given, at any stage?—Sentiment would only be one factor.

3367. You have taken cognisance of the sentiments that move the Indian people?—Sentiment is one of the factors.

3368. A very important factor too, I agree. But, as far as you are concerned, you have given your evidence purely from the business-like point of view?—Certainly we think that the gold standard would be better than the gold exchange standard.

3369. On commercial standards, with a commercial outlook?—Yes.

3370. Regarding the drain of gold on the resources of the world, if India came to a gold currency—at present even without gold standard and gold currency India is free to import whatever quantity of gold she requires, in fact has imported almost a record quantity last year—India could, even without the gold standard in future years, unless there was some other novel change made, get all the quantity of gold that she may require for private use. The additional quantity that may be required for gold coinage would represent after a period of five or seven years, comparatively speaking, a very very small increase on the takings of India at her sweet will for her private requirements?—You mean that the initial cost would be great but that thereafter——

3371. (*Sir Purshotamdas Thakurdas.*) I am not thinking of cost. I am thinking of the total quantity of gold which India will absorb with the gold currency.

3372. (*Chairman.*) I think the witnesses told us that they could not form an estimate of that.

3373. (*Sir Purshotamdas Thakurdas.*) If I may, I will put the question in one or two stages—perhaps I made my question too long. India does import freely gold that is required for the people in the form of bullion. There is no check on that. The only addition therefore which will be required in India would be for the purposes of currency, and that additional amount would not be very much after a period of years, when the people have been inspired with the fullest of confidence that they can get paper converted into gold for the mere asking by going next door. Would you agree with that?—(*Mr. Brent.*) Well, to put it in a very few words, what you mean is that there will be sufficient gold available to supply India for her needs as well as for currency purposes?

3374. There is sufficient gold to-day by private import, is not there? There is no check on that?—None whatever.

3375. Therefore, India can take all the gold which she likes for her own requirements. The only question is of the currency?—The question is at what price? I mean to say she only takes what she requires because she is prepared to pay the price for it.

3376. And she paid the price right up to Rs. 28 or Rs. 29. I do not know whether she paid higher—and as low as 21 as happens to be the case to-day?—Yes.

3377. Would the gold currency being in circulation, in a period of years, say five or ten after the currency is put into circulation, make a material difference to the total quantity which India may require for private use and for private hoards?—That would depend entirely ou how it circulates.

3378. (*Sir Norcot Warren.*) I understand that your Chamber would prefer to see the use of cheques rather than of currency notes encouraged in India?—Yes, that is so.

3379. In this connection you said that your up-country experience was that the poorer people could not distinguish between a sound bank and an unsound bank?—(*Mr. Grantham.*) Yes, the very poor people. I don't think they can read a balance sheet.

3380. No, they cannot read a balance sheet but they can obtain information and advice from those who can. Because my experience is they can distinguish and the only reason they bank with unsound banks is because of the greater facilities they get from those banks such as being allowed to open current accounts for small sums and to draw cheques for very small amounts, etc. Therefore they are more or less driven to those banks not because they are unable to distinguish between a sound bank and an unsound bank but because of the greater facilities they obtain from the latter?—I do not know that the question of distinction would arise; owing to their getting more facilities from the unsound bank than the sound, they would go to the unsound bank for that reason and no other.

3381. Do not you think, that, if a sound bank allowed them to draw cheques for Rs. 2-8 or Rs. 5, they would rather open accounts with sound banks?—Certainly, if they realised it was a sound bank.

3382. From experience I maintain that they do. What I want to get at is, suppose the Central Bank, instead of saying "You are not to draw cheques for under Rs. 50," allowed them to draw as low as Rs. 5, would not you then get all these accounts which are in unsound banks?—The question of facilities is raised again. I think that if greater facilities are given they would change over for that very reason. But I do not know that they would change over because one bank was sound or another was unsound.

3383. You mean to say that in the districts of India they do not know that what they call the Government bank is the soundest bank of all the banks up-country?—Yes, I think as regards the Government bank they would have some realisation but amongst a multitude of smaller banks I doubt very much whether they would realise.

3384. Do you not think they can distinguish between the Government banks from the small banks?—I think they would that. I did not have that in my mind when I gave my answer. My answer was given on the supposition that there were a number of small banks in operation.

3385. (*Chairman.*) Leaving for the moment your paragraphs on the ratio and before dealing with those arguments, I have one or two questions beginning with paragraph 17 of your memorandum regarding the Currency Department in which, subject to certain conditions, that is the absorption of the personnel of the Currency Department and the making of a fresh agreement between the Government of India and the Imperial Bank, your Association expresses the opinion that the transfer of the note issue to the Bank would result in advantages sufficiently solid to make the transfer desirable. In the first place, will you elucidate your proposal to some extent by telling us whether you propose that the transfer should be the transfer of the absolute control of the note currency and the reserves against the note currency to the Bank, or whether the transfer should only be of the management of the note issue acting as agents on behalf of the Government?—We mean complete control.

3386. Will you enlarge a little the final sentence of paragraph 17 by telling us what, in your opinion, would be the chief advantages of such an alteration?—The advantage to be derived from the closer union between banking interests and the issue of currency was at the back of our minds.

3387. You have in mind the unification in one hand of the control of the bank reserves of the country and of the currency reserves?—Yes.

3388. I take it that the advantages which you see in that are the advantages of getting rid of any lack of co-ordination which there may be in the existing division of control in hands which are not in perfect communication although they may be in consultation?—That is so.

3389. Have you considered whether you would recommend any changes in the constitution of the Imperial Bank as a preliminary to such a transfer?—No, Sir, we have not considered that.

3390. Understanding, then, that if you express any opinions they are only your personal opinions, have you any opinions upon that question?—No, I do not think I should be prepared to express any.

3391. Have you, Mr. Brent?—I do not think so, Sir, without giving the matter more thought than I have done yet.

3392. What is your opinion as to the advisability of issuing notes smaller in denomination than Rs. 5?—(*Mr. Grantham.*) Well, our Chamber in the past has opposed the issue of the one-rupee note, for example; they were in favour of its being taken out of circulation. Beyond that the Chamber has not considered the matter.

3393. Can you tell us on what grounds they were opposed to the one-rupee note issue?—As far as I remember, the question was looked at partly from the point of view of cost. We were told that the issue of the one-rupee note was expensive. It was looked at partly also from the point of view that the one-rupee notes in use were terribly dirty and insanitary, and consequently inconvenient to handle from the commercial point of view. Thirdly, we understood that a great many of these one-rupee notes were destroyed in actual use so that there was a grave wastage.

3394. What emphasis would you lay upon the argument in favour of small notes as against the argument to which you have referred against them, that the issue of smaller notes tends to economy, to the popularising of the note issue, and the promotion of confidence?—We should rather see the extension of banking facilities than of the note issue.

3395. You would look to the day of the small cheque rather than to the day of the small note? Which of those two methods can more readily be promoted amongst the uneducated people of the countryside?—The first would be the more quicker and the more readily attainable.

3396. In paragraph 19 on the Currency Department you say that your Committee would prefer the automatic increase in the volume of currency to any system giving a slow and steady annual addition irrespective of the volume of trade. Could you outline what machinery you would recommend for the provision of an automatic increase in the volume of currency, with special reference to seasonal expansion and contraction?—I think in answer No. 19 we had in mind the complete gold standard which would give an automatic increase.

3397. In this particular paragraph you were referring to the fundamental characteristics of the two standards?—Yes.

3398. Then might I ask you a general question? Have you any suggestions to make as to the best machinery to be adopted under an exchange standard system for the seasonal expansion and contraction of currency?—I do not think we have any suggestions to make over and above the one which we have made in our memorandum in parapragh 24 regarding the possibility of using demand trade bills

or hundis. That is the only suggestion we are prepared to put forward over and above the system at present in use.

3399. Then I understand from paragraph 24 that your Association recommends that the seasonal expansion and contraction should be provided for by the re-discounting of upcountry trade bills or hundis?—Yes, that is what we should like to see.

3400. I do not quite gather the force of the supplementary paragraph to No. 24. Might we put it in this way: that you are opposed to direct discounting by the Imperial Bank but that you are prepared to admit that it may be a necessity?—It may be a necessity as far as the demand hundis are concerned.

3401. Could you amplify that answer a little? It is not quite clear to me what the distinction is?—(*Mr. Brent.*) The expansion is so far confined to the discounting of three months' bills. A very large amount of trade advances are given on a demand basis and if a percentage of these were utilised as security for the seasonal expansion, it would undoubtedly be an additional means of doing so. At present they are not touched at all.

3402. Your recommendation is that the present procedure should be amended by permitting the direct discounting of a certain percentage of demand bills?—That is so, Sir.

3403. On the gold standard reserve I gather also you recommend that the control of the gold exchange standard reserve, as long as one is in existence, should be in the hands of the Imperial Bank?—Yes, that is so.

3404. Have you considered the advisability or otherwise of a unification of the two reserves into a single reserve, assuming the transfer of control to the Imperial Bank?—That has not been considered by the Chamber.

3405. The memorandum, therefore, proceeds upon the assumption that these reserves are to be kept distinct?—Yes, until such time as there should be a complete gold standard.

3406. Did this recommendation proceed upon the assumption that it is necessary that the two reserves should be kept separate?—We felt it was necessary that there should be a reserve as long as there was a gold exchange standard in operation, and I should not be prepared to say that we would like to see them combined with any other reserve.

3407. Could you assist the Commission at all by telling us what your reasons would be for disliking to see a combination of the two reserves?—I think we should feel that the paper currency reserve was a backing against the currency and the gold exchange standard reserve was a reserve purely to be used for the support of exchange, and that it would be dangerous to combine the two so that the gold exchange standard reserve might be possibly used up for other functions.

3408. Let me put this possibility to you. An estimate of the extent to which the silver rupee currency is contractible might be made. That possible contractibility might be accepted as a liability against the assets of a combined reserve. The assets of the gold standard reserve might then be combined with those of the paper currency reserve. Thus the end might be attained of a combination of reserves ensuring the automatic contraction and expansion of currency. At the same time it might be said as a full recognition that the assets of the gold standard reserve had to protect the external value of the rupee. Would you be prepared to express any opinion as to the possibility or advisability of such an arrangement?—I do not think we can express any opinion as we have not discussed it.

3409. On the subject of remittance, again I feel that the precise nature of your recommendation requires a little elucidation. You express the opinion that the Government remittance should remain under Government control. Are you of opinion that, if a proportion of the note issue and the reserves, including the gold standard reserve, were transferred to the Imperial Bank, it would be an essential condition, in order to enable them to discharge the functions, that they should also be in practical control of the Government remittance business which is so large a part of the total volume of dealing in sterling exchange?—(*Mr. Brent.*) It is on that assumption that we have put forward our suggestion—not complete control, but partial control.

3410. Can you explain how you would divide the control and responsibility as between the Government and the Imperial Bank?—Well, a suggestion was put forward that so far as the Government home charges required, they might be divided up into quarterly requirements or even monthly requirements, and to that extent the Imperial Bank should have complete control. Our main object in view was to avoid disturbances in the exchange market by the possibility of the whole year's requirements being taken at once.

3411. I gather, then, with regard to the nature of the arrangements between the two parties that your proposal is that the Government should specify monthly their requirements to the Imperial Bank, and that it should be the business of the Imperial Bank to fulfil the Government's requirements?—That is so, but we do not necessarily confine them to monthly requirements; I mean that is simply an idea; if quarterly requirements are more suitable, then to that extent complete control.

3412. That is, there should be periodic specifications to the Imperial Bank as to the Government's requirements, and it would then be the business of the Imperial Bank to fulfil them?—Yes.

3413. That would satisfy your requirements as to the maintenance of substantial Government control?—Yes.

3414. You recommend that the business of remittance should be effected by means of public tender on the grounds (*a*) that it would be more equitable and (*b*) that it would promote a greater feeling of confidence in the minds of the public. Would you explain to the Commission (*a*) in what respects it would be more equitable and (*b*) in what respects it would promote a greater feeling of confidence?—(*Mr. Brent.*) Taking equity first, up to the present, Government purchases in this market have had no definite control and it has been at Government's own option as regards the amount purchased or the rate raised and there has been a certain amount of feeling as to what the next step was going to be, whereas public tender would eliminate that to a large extent.

3415. Everybody would have an equal chance?—Exactly.

3416. There could be no suspicion of either preference for one source of supply or another or of the bank not doing as well as it might?—Yes, that is the idea.

3417. I do not know whether that needs supplementing as regard the feeling of confidence?—I think the one answers the other.

3418. (*Sir Reginald Mant.*) You contemplate, do you not, that the management of the Currency Department should be transferred to the bank during the transition period?—(*Mr. Grantham.*) Certainly, straight away.

3419. Straight away, i.e., at the beginning of the transition period?—Yes.

3420. And the bank should immediately undertake the responsibility for giving gold or sterling in exchange for rupees?—Yes.

3421. And do you think they could safely undertake that responsibility?—Yes.

3422. I take it you contemplate that the present reserves, the currency reserve and the gold standard reserve, should be made over to the bank?—Yes.

3423. And do you consider that with those present reserves they could safely undertake this responsibility?—I think yes.

3424. One other question as regards the tender system. Do you contemplate a system of tender in India or would you revert to the practice of selling council bills by tender?—(*Mr. Brent*) We contemplate a tender system in India.

3425. You think that it would be feasible?—I think so, yes.

3426. Now you will have to collate them in one centre, I presume; where would you collate them?—Why one centre? You may have your three large commercial centres, Calcutta, Bombay and Madras.

3427. The tenders would have to be collated somewhere?—Yes; the tenders would be handed in at each centre and the results will be published the next morning.

3428. Would you have separate tenders in those different centres?—I see no reason why you should not have them. It will facilitate matters so far as trade is concerned.

3429. Would you ask all to tender for the full amount?—Tender for what they wanted.

3430. I mean would you distribute the amounts between those three centres, i.e., allot so much to Calcutta and so much to Bombay and so on?—No, I do not think it will be necessary. It will be a question of allotment of percentage on application.

3431. Then the tenders would have to be collated at some centre?—Oh, yes. Quite so. But I mean to say there is no necessity why the tenders should only be applicable to one centre.

3432. The tenders might be received at different places but they must be collated at some one centre?—Quite so, certainly, so that it will be an equitable distribution.

3433. You do not think there will be delay caused by collecting them at one centre?—There should not be unnecessary delay. Cable communication for Government purposes is fairly rapid in this country.

3434. (*Sir Henry Strakosch.*) With reference to paragraph 24 under the head "Paper Currency Reserve", you differentiate between re-discounts and discounts by the Imperial Bank of India and you are penalising the discounts by saying that they should not be allowed to form the basis of the note issue. May I ask you whether you consider that condition an essential one, having regard to the fact that the Imperial Bank when it is turned into a real Central Bank will have to control the credit policy of the country and fix the bank rate?—It is not customary in all central banks that in order to enforce their policy these banks are permitted to discount; but as a matter of practice they never do it unless they are forced to impose upon the community their policy.

3435. Yes, but is it not possible that the policy of the commercial bank, if I may call it so, may run counter to the policy of the Imperial Bank, and that, for that reason, in order to keep control of the credit market, the Central Bank may have to intervene by discounting direct?—(*Mr. Grantham.*) Without further consideration we shall have to say "no" to direct discounting.

3436. Although that may impair the power of the Central Bank to manage the money rates of the country?—I think so.

3437. May I put to you a case? Usually the bank rate is somewhat above the market discount rate. Well, it is conceivable that when the market rate has risen to the bank rate commercial banks will nevertheless refuse to discount at the bank rate. Do you suggest that in those circumstances, the Central Bank should not intervene and discount at its rate?—Rather than put up its rate?

3438. Why should it put it up if the Central Bank considers that the rate is high enough?—It is a difficult question to answer without further consideration.

3439. Then upon another subject: You say in that same paragraph, I take it to supplement the possibility of expanding the currency, you would recommend the use of demand trade bills for discount by the Imperial Bank. I am not quite clear what you have in mind. Demand bills, as I understand them, are not discountable because they are payable on demand?—(*Mr. Brent.*) That is perfectly true; but a very large percentage of seasonal demands, financing of cotton particularly, is done on a demand basis; the bank has the option of calling the loan up at any time; but it does not generally do so. Moreover the demand hundies from up-country may take two or three days to reach Bombay.

3440. I can understand that; that is, three days discount. But what I cannot understand is how you can discount a demand bill. How many days would you reckon in discounting those bills and how many days would the holder consent to be charged?—The idea was not to attempt to utilise the full amount of demand bills available but a very small percentage. I mean even 10 or 15 per cent. of demand hundis utilised as security against advances would be ample.

3441. I am afraid my question is not answered. I would like to know how a bank is to deal with demand bills in discounting them. How could it discount demand bills?—I mean to say, they are bills as collateral security until they are paid; are they not? If you were in possession of half a crore demand bills and you wish to take 10 lakhs advance against them, you could hand those half crore over as collateral security against your 10 lakhs advance, it would be perfectly permissible.

3442. Where I still do not appreciate your suggestion is this: Let us suppose I were to hand over to the bank a demand bill, the bank would in the ordinary course present that bill immediately for payment?—Yes; but it does not in the ordinary course.

3443. If it does not, then of course it bears a loss of interest; so long as it does not get paid, it bears a loss of interest?—But these demand bills all carry interest.

3444. Now I want to know how much discount is it customary to allow on demand bills, a fortnight, month, three months, or six months?—It will be anything from one day to six months.

3445. At the choice of the Bank?—Yes.

3446. And then, they simply deduct their discount from the demand bill on the understanding that the demand bill will not be presented until three or six months hence according to the rate; is that it?—According to their own arrangement, with the drawer of the bill.

3447. So that, in other words, it is nothing else but an ordinary commercial bill drawn for a longer period except that it is not stated on the bill?—Yes.

3448. Would you tell me why they are drawing those demand bills and not bills for the date?—The banks insist upon it. They are in a position to demand payment any time they like.

3449. And yet the holder of the bill agrees to a deduction of whatever may be agreed?—Yes.

3450. (*Sir Maneckji Dadabhoy.*) In discussing these Government remittances in paragraph 20, clause 2, your Chamber is of opinion that "Government remittances should be effected by means of public tender, either in London or in India, rather than by private purchases of sterling." Am I to understand this your scheme of remittances excludes the power of the Secretary of State for drawing bills for trade purposes, selling bills for trade purposes, for the accommodation of trade?—(*Mr. Grantham.*) Not as long as he sells them by public tender.

3451. Then in the case of accommodation for trade purposes you would also give him the same power to do it by public tender?—Not the Secretary of State. We have stated here that Government remittances should be controlled by the Imperial Bank.

3452. In London or in India?—Whether the remittance was to be effected here or in London it would be done by the Imperial Bank.

3453. But if the scheme regarding the transfer to the Imperial Bank fails and if Government remittances are to be continued, would you give the Secretary of State power to sell council bills for purposes of trade also?—Yes.

3454. And in that case you would require that to be done by public tender only?—Yes.

3455. Does any other country do this for purposes of trade?—I don't know, Sir.

3456. (*Chairman.*) Now turning to the paragraphs on the ratio, the conclusion at which your Committee has arrived, as expressed in paragraph 16, is that it is desirable as soon as possible to alter the ratio from its present 2 shilling level to that of 1s. 6d. Should I be summarising the arguments expressed in your memorandum if I were to say, in the first place, that this rate should be adopted because it would cause the least disturbance?—Yes, that is so.

3457. And, in the second place, because it provides a bigger margin than a lower rate to cover any rise in the price of silver?—That is so, Sir.

3458. Let me see if I have followed the argument as expressed in your memorandum step by step. A rise in exchange means an increase in the gold value of the rupee, and that results in a fall in the internal prices of agricultural produce. The second step is that the cultivator gets less for what he sells, so that he has to devote a bigger proportion of his produce to paying taxes and land revenue. That is the next step as the result of a rise in the exchange?—Yes, Sir.

3459. But, as I understand it, the fall in prices is ultimately general, so that the cultivator thus pays less for what he has to buy?—That is so far as what he buys is concerned.

3460. So that ultimately, after a sufficient period of readjustment, the family budget should be the same as before?—I do not think we could say that absolutely, sir, because we are not sure that internal prices have moved entirely with external prices.

3461. No, but allowing a sufficient period for adjustment, you would say, as I gather from your memorandum, that that would be the tendency?—As regards all commodities whose prices would change according to the exchange rate, but that omits what you mentioned just now about taxes and the land revenue.

3462. What are the principal commodities he would buy which you would expect to react slowly in their price to the effect of a rise in the exchange?—(*Mr. Brent.*) For example, cotton goods would be affected very largely by external prices. It is really the internal goods that are not to any degree exported that would be the last to be affected, I think.

3463. Are those mostly goods which he sells or which he produces?—There are a certain number of goods that have to be bought in this country the prices of which are not affected very largely by external prices.

3464. What have you in your mind?—Well, I mean his local requirements, of certain types of food grains, that do not figure in the exports of India. (*Mr. Grantham.*) Bajri, firewood, salt.

3465. These food grains and so on are the commodities of which the cultivator in question is the actual producer?—(*Mr. Brent.*) Not always, Sir.

3466. If you generalise the whole class of cultivators?—But the man who grows cotton does not necessarily grow *bajri.*

3467. Taking it as a general effect, and making allowance for what you say as to the failure of goods which are produced at home and consumed at home to react, I understand your general analysis is that, after a temporary detriment to the cultivator as a producer, there is a substantial readjustment?—(*Mr. Grantham.*) In commodities, yes.

3468. And in their prices. Let me ask you on that: are you of opinion that, as regards these articles which may be of importance in the family budget which are produced in India and consumed only in India, the change of the general price level between them and goods which enter into the external market has no effect upon the prices of these goods of internal production and consumption?—But surely that question is one of supply and demand.

3469. Other things being equal, the supply is unchanged and the demand is unchanged?—Well it would have the same effect, but not a complete effect.

3470. Now turning to the other side of the picture, the result of a fall in exchange will be the converse of what you have dealt with in regard to a rise in exchange. It would produce a temporary benefit to the producer in the manner you have described in relation to these articles of special production and consumption, but that benefit would tend to be a temporary one as prices readjusted themselves to the new level of exchange. It is really only the converse of the analysis which you have given?—Yes.

3471. These would be the disturbances which would arise from a fall in exchange, and it is those disturbances which you desire to avoid by fixing the ratio at the present level of exchange?—(*Mr. Brent.*) That is so.

3472. That implies, as I gather, that you are of opinion that the present price level in India, as compared with general world prices, has substantially adjusted itself to the present level of exchange?—(*Mr. Grantham.*) Yes, I think it has, Sir, but it is very difficult to make an answer to that.

3473. And, finally, you express the opinion that you feel reasonably confident, now that the United Kingdom has returned to a gold standard, that the low gold point of 1s. 5$\frac{31}{32}$d. can safely be maintained. Would you care to amplify the reasons which led you to that conclusion? For instance, does one infer from that opinion that you do not look for any violent dislocation of the price level in the principal industrial countries in the near future?—Yes, that is the implication and the reserves would appear to be sufficient to cope with any smaller adjustments.

3474. To complete the picture from the Indian point of view, you are of opinion that the reserves are sufficient to cover any fluctuations in demand and supply of relative currencies such as are likely to occur?—Yes.

3475. (*Chairman.*) Are there any supplementary questions on the ratio aspect?

3476. (*Sir Maneckji Dadabhoy.*) In your scheme, of course you have recommended a gold standard and the adoption of the lower ratio of 1s. 4d. would facilitate the introduction of the gold standard to a certain extent, wouldn't it?—(*Mr. Grantham.*) I cannot see why.

3477. Well I can give you an illustration. If the ratio be 15 to 1, the drain on Government will be considerably less for the purpose of converting silver into gold than if the ratio be 1 to 13$\frac{1}{3}$?—I am afraid I do not follow that.

3478. You see if there was a gold standard introduced Government would have to meet the conversion of silver rupees into gold. If the ratio fixed is at 15 to 1, or 1s. 4d., you will require 15 rupees to get one gold mohur or one sovereign; but if the ratio is kept a higher ratio you will obtain a gold mohur or sovereign for Rs. 13 and one-third. So the drain on Government will be in that way considerably less. I mean the drain on gold?—Yes, that is so.

3479. Would it not therefore be in the general interest to keep the lower ratio as far as possible?—I do not think one can look at it from one aspect solely; we were looking at it from the point of view of general disturbance.

3480. To other countries?—To India.

3481. Would not that general disturbance adjust itself in a measurable distance of time? It would not remain a permanent feature?—But the immediate effects may be very serious, whatever the ultimate effect may be.

3482. You think the difference between 1s. 4d. and 1s. 6d. is so great as to cause a serious immediate effect? Am I to understand that?—Yes.

3483. I cannot reconcile two of your paragraphs: in paragraph 15, clause (2), you say, " In discussing this matter my Committee have given the fullest consideration to the question whether a change in the ratio of a token coin involves any section of the people of India or any part of India's commercial activities in hardship or loss. . . " and then you continue " and inasmuch as my committee are of opinion that a country's main obligation is to its internal debtors they agree that every effort should be made to stabilise exchange at a figure as near the original ratio of 1s. 4d. as possible "?—That is quite consistent with what we have already said here, that the disturbance through getting any nearer than 1s. 6d. would be too great.

3484. So here when you contemplate a nearer ratio to 1s. 4d., am I to understand that you contemplate 1s. 6d., as stated in paragraph 16?—Yes.

3485. On that basis, of course, I could understand it, not otherwise?—That is so.

3486. In contemplating this ratio of 1s. 6d., does your Chamber take the price of silver at a fixed point?—No; we have contemplated that silver may fluctuate.

3487. And therefore you provide a margin?—A small margin, yes.

3488. You are aware that we have been able to keep this ratio at 1s. 6d. because India had the unprecedented good luck of five good harvests; you are aware of that?—Yes.

3489. Suppose a famine takes place in the country, what would be the effect?—I do not quite follow that question, because once the ratio is fixed on a gold basis neither famine nor anything else should alter it again.

3490. So far as internal conditions are concerned? —The idea is to fix your ratio on a proper basis; famine should not then alter it.

3491. But will not the internal conditions be affected by it?—We hope not.

3492. Proceeding, you enumerate three reasons, namely, a large expansion of the currency, a rise in the internal price level, and, lastly, losses to Government in connection with the payment of home charges, external debt, &c., which might or might not be balanced by increased duties and greater prosperity. We will not discuss the last point; but tho first two, (*a*) and (*b*), are your concrete reasons for fixing the ratio at 1s. 4d. or as much as possible near 1s. 4d.?—I cannot see that we should be frightened; we are practically having 1s. 6d. at the present moment.

3493. Am I to understand that your Chamber is of opinion that the time has arrived in India now for fixing definitely the ratio at 1s. 6d.?—Yes; we think it should be fixed and that it would be a benefit to trade to fix it.

3494. (*Sir Maneckji Dadabhoy.*) You think the monetary conditions in Europe are fairly settled?

3495. (*Chairman.*) That is what the Committee have said in paragraph 2: " My Committee are unanimously of opinion that the time is now ripe for an attempt." Then the memorandum refers to the uncertainties consequent on world gold values. We asked the witnesses about that and they referred to the American situation.

3496. (*Sir Maneckji Dadabhoy.*) I only wanted to find that out, Sir. That is all I have to ask.

3497. (*Sir Purshotamdas Thakurdas.*) The temporary period of transition for readjustment after the rise from 1s. 4d. to 1s. 6d., do you think that it is anywhere near complete, that that period is now finished and that the adjustment has taken place in India?—Yes.

3498. Both regarding the commercial world and the industrial world? Or only in the commercial world?—You are talking of the price level.

3499. Yes. What I mean is, as it affects local industries and as it affects the grower. I think your first reply " Yes " referred to the grower; would you say that it refers also to the industries?—Your question was whether the price level had settled down, not what its effect on industry would be.

3500. You think that the price level has settled down, and that the temporary transition period for adjustment of prices can be regarded as complete?—I think very nearly complete.

3501. You think that can be said to be quite accurate regarding the industries where the adjustment of a fall in wages has not yet come about?—I do not follow the application of that point.

3502. Regarding industries, with the increased value of the rupee there has not been a corresponding decline in the wages?—But I do not contemplate that there will be a fall in wages in India in industries in accordance exactly with the fall in prices. I think it is most improbable.

3503. Would not the industries to that extent be worse off?—They might quite conceivably be worse off, but I think the tendency will be for wages to rise rather than the reverse.

3504. Would not that accentuate the handicap on the industries?—It might, but I cannot see what that has to do with the ratio.

3505. The gold value of the rupee having increased, the imports will be able to compete with the local industries much better?—Quite right, but reducing the ratio would not stop wages rising.

3506. No; they may go higher; that is your fear? —That is my fear.

3507. You think that if exchange was practically at 1s. 4d. the cost of living would rise and there may be a further increase?—I am afraid the wages might rise anyhow, irrespective of this question of the ratio. My point is this, that I do not think wages would automatically rise and fall as exchange rises and falls in inverse ratio. I do not think the two are connected to that extent.

3508. There would be a continued maladjustment between exchange and the wages payable in India?—That is quite possible.

3509. Does that also apply to wages for agricultural purposes?—I do not think I am sufficiently acquainted with agricultural wages to answer.

3510. Now, supposing it was correct that the wages of agricultural labourers has not declined since the rise from 1s. 4d. to 1s. 6d., do you think that the adjustment as far as the grower is concerned is still incomplete?—I do not know what governs agricultural wages; it may be the same principle that governs industrial wages; there may be a tendency throughout India for wages to rise.

3511. Supposing that was so—that is just what I am asking you to do, taking that for granted: from a statement I have seen, it is reported that wages of agricultural labour have not gone down since the rise of exchange to 1s. 6d. To that extent do you think that the adjustment is incomplete?—I do not think one could say the adjustment is incomplete, for the rise in wages was not entirely due to the rise in exchange or a fall in exchange.

3512. If the wages to-day were the same as in 1920-21 or 1921-22, do you still think that the harm to the agriculturist is adjusted?—I would put the question into two categories. The first is whether there has been an adjustment of prices. The question whether there is harm to the agriculturist through a rise in exchange is another question. I do not see that the two have any real connection.

3513. Your reply was that you thought that the adjustment in prices was complete?—In prices, yes.

3514. Now, if the adjustment in prices is complete this year, a change from 1s. 6d. would not be desirable or rather would not be necessary in the interests of the grower?—Yes.

3515. But if the grower still continues to pay the same wages as in 1921-22? I would request you to take that for granted for the sake of this argument because you say you have yourself no information about it; would you then under these circumstances say that the adjustment so far as the grower is concerned is not complete?—I would not answer it that way because I still cannot see that the rate of wages in India is governed either by prices or by the rate of exchange.

3516. Not even as far as the grower is concerned?—I would not be prepared to say so; I do not know enough of agricultural wages.

3517. Shall we take it this way, taking the question of wages working independently, if the wages do not come down and owing to increased price of the rupee the agriculturist gets lesser rupees than he got two years back, do you not think that the damage to the agriculturist is considerable?—We have already said that if there is not a complete adjustment the agriculturist would suffer.

3518. I knew you had said it here, and that is why I was just bringing it to your notice?—(*Mr. Brent.*) Against that it is pointed out that the disturbances which might emanate from the change would possibly have a greater effect than the reduction to the old level.

3519. (*Chairman.*) I want to ask one question to clear my own mind upon your last answer, Mr. Grantham. As I understand it, you are of opinion that there are other factors affecting wages industrially and possibly agriculturally in India in addition to the factor of the rate of exchange?—Yes.

3520. So that when one looks at the movements of nominal wages, one must not draw any simple deduction from those nominal rates as to whether the effect of a change in the rate of exchange has yet made itself fully felt upon the rate of nominal wages?—Yes, Sir; that is what I meant.

3521. Because it may be thought that, although the nominal rates do not show it, the effect is there, but it has been masked by some other effect?—Yes.

3522. On a subject of interest, can you suggest in a few words what the other factors are which you consider are at present affecting the rates of wages industrially?—I had in mind, Sir, industrially that Indian labour was being constantly educated up from outside India with the idea that it was being paid too little.

3523. That is, the general education of labour to better itsolf?—Yes, and that was having a very marked effect on the wages question.

3524. Is improved accommodation having any effect on it?—There is a slight tendency to better conditions, but it is not very marked yet.

3525. (*Chairman.*) On behalf of my colleagues and myself I thank you for your very full assistance today, and for the very helpful memorandum of your Association.

(*The witnesses withdrew.*)

ELEVENTH DAY.

Tuesday, December 8th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.

Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. A. V. V. AIYAR, C.I.E. } (*Secretaries*).
Mr. G. H. BAXTER. }

Mr. B. F. MADON called and examined.

3526. (*Chairman*). Mr. Madon, you are, as we are aware, a careful student of Indian currency questions?—I try to be, Sir.

3527. You have been kind enough to provide us with a very full and detailed memorandum* of your views upon this subject, which will save us, if I may say so, much time in obtaining the benefit of your assistance on these points. I will ask you to assist the Commission by answering a few questions to enable us to ascertain just where you lay emphasis on the views which you have developed, and also to elucidate any points which seem to require further elucidation in your memorandum. We understand that in general you favour the abandonment of the pre-war standard of currency and the introduction of new methods which you describe in your memorandum?—If I may be permitted to point it out, I do not mean the pre-war standard, I mean the pre-war system.

3528. I want, if I may, to ask you to consider with me for a moment the pre-war system, and to assist me in understanding just what the defects of that system were and how they can be remedied. I should point out that my first questions will be directed to ascertaining whether, in your opinion, the main defects of that system are not remediable by the adoption of an improved exchange standard system. Would you agree that one of the defects of the pre-war currency system was that the maintenance of the system was dependent on the price of silver remaining at such a figure that the bullion value of the rupee was not higher than its exchange value?—No, Sir, I don't agree that that was a defect of the pre-war system.

3529. Then there is no defect to be remedied there?—Not as regards the price of silver, because if you will allow me to point out, the rupee has been throughout recognised, as soon as we closed the mints, as a token coin, and that, in your system, that was recognised in 1893, it was again recognised in 1898, and it was again very clearly recognised by the Chamberlain Commission and even by the Babington Smith Commission. If it was a token coin, then the solution with regard to the price of silver should be the solution which practically every other country had to adopt and did adopt when their token silver coins went over the silver bullion parity. It is not only India that had to do it. The Straits had to do it, Japan had to do it, the Philippines had to do it, and during this war even England had to

* Appendix 17.

do it. So I would urge that the emphasis laid on the price of silver is wrong and that the right solution was to change the proportion of silver in the token or to stop giving silver coins altogether and only give notes as was done actually by many countries.

3530. I think I follow your opinion. You recognise, of course, that the system is liable to disturbance from a sharp rise in the price of silver, such as may bring the bullion value of the rupee above its token value?—Yes, Sir, provided it is taken for granted that the coin should remain as it is. If, as I take to be the right view, it is taken that the value of the silver in the coin has nothing to do with it, then the right step would be, as soon as it was found that the coin was likely to exceed its bullion value, to change the fineness of the coin so that this excess may not occur.

3531. Precisely. But some alteration may be required if the rise in the price of silver were of such an extent as to put a premium upon the melting down of silver currency?—I agree.

3532. In your opinion there should be no hesitation, in view of ultimate currency principles, in substituting another intrinsic value for the silver rupee as you point out was done in other countries?—Exactly, that is what I mean.

3533. Will you tell us what, in your opinion, and from your wide experience of the sentiment amongst the uninstructed classes of India, would be the social reactions upon the uninstructed of a change in the intrinsic value of the rupee? Do you think it would be accepted without difficulty?—Well, Sir, if you simply ask an opinion, then it would be one opinion against another. But if you go by experience, then I would point to the experience of Java and China, where the populations are equally uninstructed and equally liable to suspicions and still the thing there worked almost immediately. And the case of Egypt is much more to the point. Egypt has a population which is perhaps a great deal more turbulent, a great deal more ready to resort to violent methods than the Indian population is, and in Egypt inconvertibility was declared almost the very first day that the war began and notes circulated freely and there was absolutely no trouble. So far as the individuals within a country are concerned, what they want is some medium of exchange by means of which they can carry on their transactions. So long as the population within a country finds that it can do so, any medium is readily accepted. We had that experience in India in the case of the two-anna nickel coin when it was introduced during the war and in the case of the one-rupee note when it was introduced, although both these things were done after a great deal of hesitation. So I submit that, if we had in this country gone to inconvertibility in 1914, or '15 or '16, on the ground that every country in the world had been obliged to do the same thing, that we were a gold standard country, that gold could not be had and so there was no other right way to tackle the problem, then most probably the thing would have worked as smoothly as it has done in every other country.

3534. Pausing there, assuming that you are right that this can be done, that a fresh intrinsic value can be given to the rupee or the use of the small notes can be substituted for it, can that not be done equally, whatever the fundamental currency system of the country is, whether it be a sterling exchange standard or a gold exchange standard or a full gold standard?—It can be done in every one of them because I take it that the rupee will be merely a token coin, so under any of these three systems you would be bound to have some kinds of token coins and it does not matter at all what the intrinsic value of the token is.

3535. It may be said, indeed we have had it in evidence, that a second prominent defect in the pre-war system was that the rupee was in reality linked to sterling only and that the system ceased to be a gold exchange standard since sterling depreciated. To begin with, I rather gather from the general tenor of your memorandum that you do not lay very much emphasis on the difference between a link to sterling or a link to gold?—If you will permit me to point out, I don't at all agree that we were linked to sterling. Because, although sterling happened to be the same as gold in pre-war days, every piece of legislation, unfortunately we had very few in India in regard to currency, but the three or four definite acts of legislation have never had any link with sterling. For instance, in the very early days when we began the linking, we did not say that the pound sterling and the five pound Bank of England note was to be freely circulated in India. We said that it was a sovereign and a half sovereign, that is gold coins, that would be circulated. Then in the Coinage Acts, we provided that it was a sovereign that was to circulate as the equal of Rs. 15. Then, in the Paper Currency Act, we did not say that the Controller of Currency was to give so many rupees for so many pounds sterling tendered. It was definitely laid down that the local currency was to be issued against so many grains of gold. Now, if we are to go by definite Acts of the Legislature, then I beg to submit that the connection was never with sterling, but was always with gold.

3536. They were, as you describe, the legal provisions, but as a matter of fact was not the system before the war actually operated as a sterling exchange system?—I think the situation was this. In pre-war days it was possible for Banks to tender gold and get out currency and it was in fact done. That is why we had some 40 crores of rupees in gold in the Bombay mints when the war broke out—I do not mean in the mints, I mean the paper currency reserve. Gold was tendered and currency was taken out. At the same time I agree that sterling was accepted and currency given out and that is where I take it it was an abuse of the system, not a practice of what the system should be, because if I may make myself clear, the Secretary of State had to sell Council Bills in order to lay down money for himself for home charges, and he used that power to go on selling more Councils in order to divert gold which ordinarily would have come under the Acts to India and be converted into currency, and he accepted sterling instead; so I would submit that the pre-war system was the conversion of gold tendered into local currency, and that whenever it was sterling, it was an abuse of the system, not a correct use of the system.

3537. Turning from the question of past practice to what is best for the future, I think it is your view that it would be better that any link there is should be a link with gold and not with sterling?—Exactly.

3538. Can that object not be attained under an exchange standard by such provisions as that an adequate proportion of the reserve should be held in gold, or, indeed, that a proportion of the reserve should be held in the form of currencies or securities held in other gold exchange standard countries than Great Britain?—Well, Sir, I have submitted to the Commission a copy of my memorandum to the Babington-Smith Commission also, and you will no doubt have noticed that I think that such a system could be sound, but unfortunately the last ten years have taught us otherwise not only in India but in every country.

3539. I follow that, but I am really asking questions rather upon the theoretical side?—So my point is that for the future I would not trust such a system at all, and I would rather like to have the system which they have in England where mistakes would not be possible.

3540. You say that it is theoretically sound, but that in practice, for the reasons you have stated, you do not recommend it?—Exactly.

3541. Following out this little analysis of the defects in the pre-war system, we are told, thirdly, that the system did not provide for the automatic stabilization of the rupee because there was no statutory safeguard against the fall in the rate of exchange below the lower gold point. The Government is under no statutory obligation to sell reverse councils. Again, looking at the scientific side of the

question, can you express any opinion as to whether that defect in an exchange standard would be remedied by the imposition of a statutory liability upon the Government, or whoever it is that is in control of this matter, not necessarily to sell reverse councils, but either to sell reverse councils or to provide foreign exchange against local currency in India as a matter of statutory obligation. Would that theoretically remedy this defect in the system? —There are two aspects of the question that you are now putting to me. One is whether a statutory provision would be satisfactory.

3542. I think it would be of great assistance to the Commission if you would divide your answer in this way; first of all if you will tell us the theoretical aspect, and then, in the light of that, tell us what the practical applications will be to actual conditions?—I will try to do that. Your question has two parts—the statutory part in which the Government or the Currency Department, whoever it was, would be under an obligation to give international money against local money, and that is what really a gold standard means because gold is international money, and the Government that are under a gold standard simply undertake to give against local currency notes or cheques or whatever is tendered international money for payments abroad. They give gold. Now under the gold exchange standard they go a little further, and instead of giving gold at their own door and allowing the taker to take it wherever he likes, they go further and help the man who goes for international money by giving him that money at his own destination. That is the second part of your question where you suggest that it may be given in foreign currencies, that is, any banker who wants international money and says he wants it in Paris might be given an order on France, or if he wants it in gold dollars, he might be given an order on America for dollars. That is how I understand the proposition put by you. If that is the case, then it would be far more simple to give the gold and let that banker or applicant or whoever he is to take it to his own destination in his own way because there is another question that occurs to me here: how are Government to get hold of all these international currencies if they are to be provided? In pre-war days the only international currency that the Government was prepared to offer was sterling, and as sterling was practically gold, then the only difference between the gold standard as in England and the standard as in India was that while the Bank of England did not offer to take gold to the destination, in India the Government offered to take gold to the destination for the applicant by giving it in London itself. But if it is to be complicated by the other currencies, then I am afraid abuses are very likely to creep in, because whoever the authority is in charge might think of what currency is cheap at the moment. If French currency is very cheap, he lays in French securities. Next day if American dollars are cheap, he might try to lay in those. I do not think it is a very sound thing for any country to offer to give other countries' credit or currencies instead of gold.

3543. I was not laying emphasis on the form in which international currency would be supplied, but what I wanted first of all to ascertain your opinion about was whether, in your opinion, the acceptance of a legal obligation on the part of the currency authorities to provide either gold for export or foreign exchange as a matter of statutory liability would remedy this defect in the exchange standard system by providing for a stabilization of the rupee that would be automatic, laying stress upon the word "automatic"?—If it is an exchange standard system that we are considering, then I would certainly not have foreign credits or currencies, but if gold is to be paid out, whether from Bombay or from some other central reserve, I do not think that would be unsound, and that would make it automatic.

3544. With the reservation that the international currency is to be supplied in the form of gold for export, you are of opinion that the acceptance of the statutory liability would fortify the exchange standard system by making the stabilization an automatic stabilization?—Exactly, Sir.

3545. Turning to the next point, we are told that it was a defect in the pre-war system that there was no provision for the automatic contraction of the currency. Do you agree with that?—I do not agree with that, Sir. And I will give my reasons if I may be permitted to do so. There has been a feeling, and I know the argument has been frequently put forward, that there was no provision for automatic contraction, but the automatic contraction in the real gold standard countries only comes by means of gold going out when the balance of trade is adverse. The banks in the country do not start out to contract currencies just because they fancy that the currency is redundant, but when gold actually goes out and the basis of the circulation is reduced, then alone is the circulation contracted automatically. Now in India that happens so rarely because on balance she has been a creditor country throughout; it was otherwise with this country only in 1907-08, in 1914 when the war broke out, and later in 1920. In each of those cases what should have been done if the system had been correctly operated was to sell reverse Council Bills as was done, but not under a statutory obligation.

3546. I gather there was nothing in the statutes to impose that liability on the Government?—But reverse bills were sold in 1907, in 1914 and again sold though on very different grounds, and therefore I think on wrong grounds, in 1920. If reverse bills are sold, it really means that our reserves which were held in the form of sterling money come out of the paper currency reserve, and that amount of notes has to be automatically cancelled. So I submit that the contraction of currency automatically was there available in pre-war days under the system if it had been correctly operated.

3547. May I put this point to you. The point is that the currency was not necessarily contracted under such conditions as those to which you have referred, because the Government could arrange, by borrowing from the gold standard reserve, to meet sterling payments on account of reverse councils without affecting the amount of currency in circulation?—Well, Sir, there again, I think that the reading of the pre-war system is wrong.

3548. My question was directed to what actually occurred. Did not that actually occur?—No, it has not actually occurred. In pre-war days the money that should have gone out, the gold that should have gone out, was the gold from the paper currency reserve and not from the gold standard reserve; because as I tried to point out in my memorandum the gold in the gold standard reserve is really against the silver notes in circulation, the rupees. The paper notes that first come in into the paper currency reserve would have the reserve of the paper currency drawn against, and in proportion to the amount that goes out the notes would have to be automatically cancelled. Of course, on some occasions, it has been the paper currency that is drawn on, and on other occasions, I believe in 1907-08, they drew on the gold standard reserve; but the correct thing would have been all the time to first have recourse to the paper currency reserve, and then when that was exhausted, to the gold standard reserve

3549. Do you not agree that, if you had borrowed from the gold standard reserve in order to meet sterling payments, there is no necessary contraction of currency under those conditions?—You refer by sterling payments, payments of the Secretary of State for Home charges; you refer to that and not to the adverse trade balance?

3550. Does it make any difference for what purpose the sterling payments are made?—It makes a very important difference; because we have fortunately the experience of the last five years of England to guide us. I would beg to point out that in the last five years and perhaps longer, England has had to pay every year very large sums to America, and

none of them have gone out from the currency reserve of England. Dollars were bought in the open market, some times at very high prices as compared to the nominal value of the £ sterling. But they have bought in the open market, and I submit, Sir, in the case of India, India stands in the position of a debtor to England for Home charges. England stands in the position of debtor to America for war debt and other payments, and payments in both cases have to be made in a different way than from the reserves. The reserves should not be drawn on, and in England they have not been drawn on. It has been rather the other way. During the last few years, the fund has been constantly added to, and I believe with direct help of Government, from gold that Government had got hold of in different ways, and at the same time Government has not used that gold to pay America.

3551. I think I need not press you on that point, because you do not see really that there was any defect as described in the pre-war system?—Yes, if it had been correctly understood. Unfortunately it was not.

3552. I think we must try and get to the bottom of that. The pre-war system was capable, shall we say, of being operated amiss, so that there would be, as a matter of fact, the sale or letting out of the international currency without any contraction of the internal currency?—There I agree; it was possible to misoperate it.

3553. That was the point I wanted to get at?—Yes, that is its greatest defect.

3554. I want to put the question to you whether that is a remediable defect of a perfected exchange standard system?—I am afraid, no, Sir.

3555. May I suggest to you the outlines of a system which would be still an exchange standard system in order to ascertain your opinion whether it would be a system that would remedy this defect. Supposing that you combined the gold standard reserve and the paper currency reserve into one, so that there is only a single reserve, and that is a reserve both in form and in substance to protect the exchange value not only of the paper notes of the country, but of the silver notes of the country also; so that when rupees are paid in and the gold or sterling reserves of the system are paid out there is a contraction of the reserves which must produce automatic contraction of the internal currency, would not some arrangement of that sort give you an exchange standard system which would provide automatically for the contraction of the internal currency when international currency is let out in a manner which it would be impossible to abuse?—Well, Sir, I do not mean any offence, but—

3556. May we have first of all your opinion on the scientific basis, and, secondly, on its application to practical circumstances?—On the scientific basis, I have already expressed earlier when I said that if the system could be operated correctly, then the gold exchange standard, as I understand it and as I have tried to put it forward before this Commission, would be the same thing as the gold standard, because it would mean that the reserves are kept in one central place instead of being dispersed all over the country and to that extent I may say that the system could be correctly operated; but unfortunately in the last ten years we have seen it in every country that for one reason or other, political or social, as we now see even in France, forces are too strong for the man in charge and there is always a temptation to do something that solves the difficulty of the moment and let to-morrow take care of itself.

3557. How could the system which I have so roughly outlined be misused? What would you fear? Where would you fear the dangers would materialise? —Well, Sir, in the various directions in which mistakes have happened in the past, the same mistakes might be made by some future Finance Member or by some future Secretary of State. It is perfectly possible, and then they would give the same kind of reasons to validate their action. That is the fear that I have in my mind.

3558. The system to which I have referred would be based, would it not, upon the maintenance of a certain proportion of reserves? Would you fear that such mistakes would come to a head in the form of improper alterations from time to time in the proportion of the reserves?—They might come in the shape of the constitution of the reserves, as it happened between 1915 and 1920, when the fiduciary circulation was increased constantly by so-called legislation every few months or every year almost. Of course, it is very difficult to imagine the kind of circumstances that may arise in the future and the action that the future statesmen may take under those circumstances; but what I am afraid of is that the abuse would be there, the chances of abuse, I mean.

3559. Now to anticipate a little, the scheme which you outline yourself would be based as to its soundness and efficient working also upon the maintenance of a proper reserve, would it not?—Well, Sir?

3560. The question I am asking you is whether, under the system which you outline, there is at any rate an opportunity for the abuses which you fear just as much as under the scheme we have just considered in outline?—As humanity is constituted, almost any system can be abused by men who want to mistranslate the regulations according to their own wishes. But if it is the kind of system that I now advocate, and it is practically an imitation of the Bank of England system, except that we are saddled with this huge amount of token money in circulation actually, then the public in a few years' time, would get to know what would happen when gold went out. It would also get to know what the notes or the token money in the country really meant, that they meant so much gold and so on; so that just as in England, the advocacy of a change in the value of the pound found very few supporters and ultimately England went back to its pre-war par, in India also with their knowledge of what the currency really was it would be far more difficult in the future to allow abuses to creep in.

3561. That is a very important and interesting opinion, which, as I understand it, is one of the bases of your proposals. I wonder if you could explain that a little further to the Commission, and in order to make it more clear, may we again take it by way of a comparison and put the question in this way. Why should the public have more understanding, and more confidence based upon the understanding, of the nature and value of their currency unit under the arrangements which you propose than it would have under a perfected exchange standard system after a period during which the gold value of the rupee remained stable?—That is mainly psychological. In every country in the world, including England, the commoner people think that gold is a much more reliable thing to hold than anything else. It was only very recently, after Mr. Churchill's declaration that I found in the English papers that gold coins had been drifting back into the banks from English hoards. I simply point that out because in England the status of education is very, very different from what it is in this country. We are absolutely in darkness here so to say. Now in India, from time immemorial, they have trusted gold; they trust gold to-day, so much so that in spite of gold having been at 35 per tola they bought it; when it went to 18 they still bought; when it came back they still went on buying it. It was the only thing that the people of India thought to be a safe and reliable store. Now in future under the scheme that I advocate, being at least as I understand it an approach to the gold standard on the model of the Bank of England, the people of this country will at least feel that thereafter their currency would be gold or the token money was immediately convertible into gold because I do anticipate granting internal conversion into gold after a few years when we have built up our reserves, that is encashment of notes or rupees into gold for internal purposes, not only for foreign payments. That is what I had in mind in my scheme.

3562. Does that appear in your memorandum?—Yes Sir. I simply say for the first few years we shall be obliged to keep the rupee unlimited legal tender but the day must come when the thing will have to be reconsidered.

3563. You say (page 159 of Volume of Appendices) that, when the gold currency gets firmly established in the minds of the public as the real money of India, the position can be reconsidered. I will ask you presently to amplify that. Then we may perhaps put it in this way, that what you lay emphasis upon is that the confidence of the public would be increased by the knowledge that a full return of whatever sort it may be can be obtained back in the form of value expressed in gold?—Exactly.

3564. Does that summarise what you have told us?—I believe it does.

3565. Just to complete this little analysis of the pre-war system, we have been told by other witnesses that another defect in the pre-war system was that the currency reserves were divorced from the banking reserve and that effective regulation of the money market was therefore impossible. I gather from your memorandum you are also of the opinion that that was a defect, the divorcement of the currency reserves from the banking reserves?—Yes. May I point out that the currency reserves and the banking reserves should not be amalgamated as one.

3566. There is no question of amalgamation?—No linking you mean?

3567. The argument is that, in so far as control is exerciseable over the use of currency reserves and banking reserves, the control should be in one hand and not in two hands?—With that I agree. In fact that is why I advocate the transfer of the Currency Department to the Imperial Bank.

3568. So I understand, but that is of course a question which is independent and not immediately related at any rate to the question we are dealing with. It is an administrative question. Now I want, if I may, to turn to your own memorandum, and to ask you to assist us to understand some of your proposals. It will be most convenient I think if I refer to your summary (Appendices, page 167). I have, I think, covered the first paragraph of your summary in the questions I have already asked you, and I should like now to ask you a few questions on paragraph 2 of your summary. There should be gold currency in circulation for the reasons we have just gone into. I do not quite follow, as regards the working of your proposals, how the gold currency would get into circulation. Could you clear that up for us?—Yes, Sir. I have proposed that while a direct obligation is not undertaken to give gold for every note or rupee presented the currency authorities should hereafter begin giving out gold as long as they find it convenient. In fact that was done in pre-war days under the old system and a good deal of that gold came back.

3569. What paragraph is that in your summary?—If you refer to the second paragraph under the heading "A Gold Standard with a Gold Currency" (Appendices, page 155), you will get the principal reason why I want gold to go into circulation.

3570. That is your object?—Yes, Sir.

3571. Now let us try to follow out how it is going to get there?—By giving it to all applicants so long as it is convenient. But I do not want to make it obligatory in the first stage because that might put on a far bigger liability than we know to-day.

3572. I think perhaps we should make a little mental note to add that to your scheme in the summary?—About its being optional? I have given that under the heading "Encashment," paragraph 8 of my summary.

3573. There is to be an optional authority to the currency authority to encash notes in gold or silver rupees whichever it prefers. If that is merely optional, why should the currency authority choose to give out gold, particularly when, as at present, it has got such an enormous stock of rupees?—My feeling is, Sir, that if we adopt the new system that is advocated by me by which all fresh currency will only come out against tender of gold and nothing else, then in a few years we are bound to have a fairly large stock of gold and the currency authority may then find that they are quite safe in giving out gold as they used to do. They did try it on several occasions in pre-war days when gold was given out without the public insisting on it. The currency authority may find after we have gone on with this new system that they have quite sufficient gold to venture to give out gold.

3574. Assuming that the gold reserves of the currency authority increase readily, it might find itself in a position to have some gold to spare to put into currency. There are two questions in that connection I should like to ask. The first is this. Can you define at all what should be the policy of the currency authority as regards the amount of gold which should be issued for currency? When should they stop?—It would depend on the amount of reserve that they think they should have in order to meet their foreign liabilities if they arose, because apart from the foreign liabilities the only use of gold would be to meet internal liabilities.

3575. Then you would say from step to step, maintaining the reserve at whatever figure is adequate for the protection of the foreign exchange value of internal currency, that whatever was superfluous to that should be allowed to go into circulation?—Yes, I would recommend that, Sir.

3576. In the second place, in view of the experience of past efforts to put gold into circulation, do you think as a matter of fact it would go into circulation?—Well, Sir, the failure in the past was really due to the fact that 25 years ago when those first attempts were made and which failed, the average earnings of the people were extremely poor. Even to-day they are very poor but they have advanced a little bit since those days, when one single unit of 15 rupees frequently meant two months' wages in many rural areas. To-day I believe it means more than 1 month's, perhaps one and a half month's wages. So, that was really the reason why gold came back; but if it comes back it should not be considered that the public do not want gold, because we have other evidence before our eyes that India has been importing huge amounts of gold. What is more, Sir, I would like to point out to you that a great deal of gold is being imported actually in coin form as sovereigns, although sovereigns cost a little bit more than ordinary bullion. That shows that people who want to keep a store of value prefer to keep it in gold to-day, and in future if gold is given out it will most probably, some of it, circulate but only in the larger towns where the disbursements of the individual happen to be much more than Rs. 15, but in rural areas it cannot circulate though it may go into stores.

3577. Of course history and experience leave no doubt that gold is very popular with the people of India for ornaments and for hoards?—Exactly. Now about hoards. I will give my views.

3578. I imagine those would not be uses of gold which you would consider it prudent to encourage?—The point is this. There again gentlemen with European training are unable to appreciate exactly what happens to all this gold. In the Indian social system under Hindu law the woman has no right to any property excepting what is given to her as a gift either at marriage or on other occasions, and she naturally wants to keep hold of that wealth, whatever she has acquired, in a way to be always able to watch over it. That means in the shape of ornaments on her person. But apart from the merely luxury side of it, where ornaments are used as a luxury, in India all these ornaments form a very important store of value for the female section of the community. Then, as I have already mentioned, a good deal of this comes as coined sovereigns for which the people pay even a few annas more. You might wonder why people pay a few annas more when it is all the same gold. The explanation is this. If I

have stored gold in my family, some as ornaments for my wife and some as sovereigns, then I will go to the last extreme before I go into the bazaar and sell any of my ornaments. It will be at once notorious that I have become practically broke, insolvent. On the other hand, taking out sovereigns from my store, as sovereigns are currency, and paying with them for my necessities, would not bring about the same kind of disgrace. This is why gold comes in these two forms into the country; I would like those gentlemen that look at it from the European point of view to understand the Indian position. The part that remains in ornaments is a store of value mainly for the female section of the community and mainly to be drawn upon when the other resources fail; because owing to the laws and customs of most of the Indian communities the female members of the family have a right at least to maintenance; and the remainder which has gone into the country in the shape of coined money, I take it, is merely value stored up for a rainy day some time in the future.

3579. From the very interesting answer which you have just given it is apparent that there is a very long road to travel before the investing habit can be very widely spread, at any rate as regards these particular gold holdings?—If I may be permitted to draw your attention to another leaflet, that I sent to you, on the External Capital Committee's Report, I have there indicated that it is hopeless to think of the investment habit spreading or the banking habit spreading in this country. Can we expect an Englishman to do his banking in German or Russian? Only 8 per cent. of Indian's population is able to read its own languages; I am afraid not even 3 per cent. are able to do it in English; and still our so-called banking is in a language which 95 to 98 per cent. of the people do not understand. Then, when you come to investment, which means holding pieces of paper which are called shares or debentures, how are these poor people who do not know how to read or write, to understand that the paper is a *bona fide* piece of investment and not a fake, and that somebody has not cheated them? It may be a digression but—

3580. It is of great interest, I think?—But I would like to point out that it has been found in America in the United States, where they are trying to give education to cent. per cent. of the community, that the ignorant population consisting of Italians, Rumanians and so on hoard their money; they do not go to banks. If that is the case in a country like America, which is practically 98 per cent. literate, then what could you expect in a country like India where 95 or 98 per cent. of the population is illiterate? So the real solution of this so-called hoarding is not to talk of hoarding and not to preach in big towns to men like me who are trained to trade and industry; but to go and appeal to the masses. How could you appeal to the masses? You cannot go into the seven hundred thousand villages of India and talk to every one; the only way is to preach it through the newspapers. Now the newspapers are hopeless because the people cannot read them. So the real trouble in India is not that the people do not want to invest, but that they cannot do it because they cannot read and write and they cannot trust pieces of paper which they do not know the value of; in the matter of literacy the census returns will tell you that the female section of the country is far more illiterate even than the male section. That will explain to you why the females of the country, even when they get gold in the shape of ornaments or in other ways as gifts and such like, do not like to invest it; they know gold, they can see it, they can feel it, they can hold it for themselves. They do not know whether the piece of paper is a fraud or not, and frauds are committed every day which these people come to hear of.

3581. From your very illuminating answer I draw the conclusion that the only thing which the uninstructed people can understand and the only thing they want is gold?—Exactly.

3582. And you look upon that as an impossible ideal, at any rate in the foreseeable future?— To-day, Sir.

3583. Within the foreseeable future?—No, Sir. I hope the Government of India will be more enlightened and will introduce compulsory education; I do not mean any offence, but I hope compulsory education is coming.

3584. You look upon it as not an immediately practicable ideal that they should be encouraged to the extent of lending their money for productive uses, for investment in banks and so on?—Not to-day, I agree.

3585. In view of the very great popularity of the use of notes in India, as revealed by statistics at any rate, do you think it such an immediately impracticable ideal that the people of the country, after a period of stability, would come to look upon the note as being as safe as gold?—They have done so already. In fact, if I may again be permitted to point out, Mr. Gubbay, who was in the Finance Department for many years, said in his evidence before the Babington Smith Committee that they had been puzzled to know what had happened to the immense amount of notes that had been issued in the last three years, that is between 1916 and 1919, and he added that Sir Dadiba Dalal, who was also one of the members of that Commission and with whom he had been discussing it because he was supposed to know the lives of the people, being one of them, both of them failed to understand what had happened to all these notes. I am simply pointing that out to show that there has been no distrust of notes in the minds of the masses as is made out. The masses have been taking notes very freely.

3586. Do you think people hoard notes at all?—That is what I was trying to make out. Mr. Gubbay's answer would show that notes went out in heavy amounts and did not come back, meaning thereby that they were hoarded until some difficulties made the people think of their hoards and spend them.

3587. In view of the admittedly more economic nature of the note as currency, and in view of this encouraging experience as to the growth in popularity of the note, might it not be said that one ought to set before the country as one's ideal of a currency system the system of a note inconvertible internally, convertible only into a foreign exchange, and that that is an ideal which might be attained practically almost as soon as the other ideal of a gold currency, leading in course of time to the education of the people up to the point of investing their gold hoards?—I agree. The point is this; the moment people in this country begin to feel that they have got simply to walk to the nearest treasury office or currency office to get all the gold they want, most probably it will be found that they will not take the gold because in up-country areas these people are rather secretive, and they would like to conceal their hoards, and it is so much easier to conceal a fifty-rupee or a hundred-rupee note by just sewing it up in a waistcoat or in the lining than to keep a hundred rupees or even five or ten sovereigns as they weigh something and as they create a noise. Of course it has not been tested in this country; it has been tested elsewhere that after the first few years of people being habituated to obtain gold when they want it, most probably it will be found that they will not go for it and that the gold will mainly remain in the currency offices.

3588. The only point which I still do not quite follow in your analysis is, why, if the popularity of the note has apparently been growing, it is necessary to have this rather, if I may call it, violent method of increasing confidence in it by a period of gold currency. Why not leave things to go on as they are, as it were, with a steady increase in the note circulation?—My answer would be this: although the note has been in circulation and has been popular, we have seen enormous amounts of gold going into the country and disappearing, at least as far as the big towns are concerned, where English methods of commercialism obtain; that is because apart from the few rupees that

a man thinks he may want to-day or in a few days all the rest of his store of value he wants to keep in gold, because he thinks he may or may not get gold. Now, if gold is in circulation most probably that distrust will disappear in a few years; the public in India will come to know that a note is absolutely as good as gold and that they have simply got to go and cash it; and then it may be that the stage that you are aiming at may come about.

3589. I am very much obliged to you for your full answer. May I just revert to your practical proposals? We have elucidated this, that there will be an optional payment of gold or silver for notes, and that that is the way in which gold should go into circulation. I do not quite follow how this provision will correlate, in the actual working of your scheme, with the fundamental provisions which are contained in paragraphs 6 and 7 of your summary. Those are, as it were, the bed-rock of your scheme. In paragraph 7 you say: "Gold should be freely issued to all who tender local currency and ask for gold; but it should be issued only for *bona fide* export purposes." That is subject, is it, to the provision in paragraph 8 that gold may be issued optionally in exchange for notes?—I may point out that for export purposes I want to make it obligatory; for internal encashment I want to make it optional; that is the difference.

3590. Proceeding a step further, I rather gathered from one of your previous answers that you contemplate a further period at some more remote epoch when the exchange of gold against internal currency shall no longer be optional but shall be obligatory?—Yes, I think that period will come; it may take ten or fifteen years.

3591. When will it come, in your opinion?—Until we have actually tried this out it is very difficult to say; but I would point out some data that may help us to come to our conclusion.

3592. Let me ask this preliminary question to make it clear to the Commission that the period will, in your opinion, have come as soon, I suppose, as the gold reserves are adequate to permit you safely to undertake that obligation?—I see what you mean. If you speak of obligation being taken on, then merely the reserves having reached a safe level in the opinion of the currency authorities would not be enough.

3593. What more would be required?—We would have at the same time to see that the token currency then outstanding is not a volume which could not be easily controlled.

3594. I do not quite follow that?—I shall try and explain. The token currency is in two forms, the paper and the silver; and although we have very accurate data about the amount of paper in circulation, the data about the amount of silver tokens in circulation are not very reliable. We could have a good guess, but that is the best we can do. Now I give you my reasons why I think we might be in a much better position ten or fifteen years hence. It has been found in pre-war days that there was an absorption of currency of some 20 to 25 crores a year, taking the last five pre-war years, 1909-1913. That has been given in one of the leaflets that was sent to me—the history of the currency system. Now, sir, if the future demands for currency remain at least as great as they were in pre-war years—and they are bound to be much greater—then the absorption should be larger year by year, so that we may find that at at least 15 crores of rupees go out of circulation year by year, if not more.

3595. Go out into circulation?—No, by absorption. The absorption really means as stores of value. People, instead of putting by notes or putting by gold, put by coined rupees, because they are equally good to go out into the markets and buy things with. That 15 crores is not too much when we consider that the population of this country is 30 crores or 35 crores, which means that if half a rupee per head may be laid aside year by year, that may do away with 15 crores of currency. It would go out of the circulation for practical purposes.

3596. What becomes of these 15 crores?—They go into the so-called hoards. Now, my point is, sir, that if, at the end of the next ten years, say in 1935, the situation is re-examined, it might be found that the amount in circulation was very much smaller than what it is assumed to be to-day. To-day it is supposed to be about 250 crores.

3597. In active circulation?—Yes, it is supposed to be in active circulation. The figure is derived from what is called the census of rupees; the method is . . . .

3598. We are acquainted with it?—I am simply pointing that out. It may be that the census taken round about 1935 might show us that the rupees in circulation were not more than, say, 50 crores or 70 crores, a much smaller figure than what exists to-day. Then alone would I take up the obligation.

3599. That would be principally as a result of the substitution of gold for rupees?—I don't think it will be substitution. It will be both. Gold will be absorbed by those who are having gold to-day and rupees will be stored and notes will be stored, whichever currency the man thinks most convenient for him to store up. It will be all. Even notes will be stored. And that was the case even in the five pre-war years, when, as I mentioned, gold was being imported in huge amounts.

3600. If the circulation of the country now requires 250 crores of rupees, as you state, and that is essential, how can it be reduced to so low a figure as 70 or 80 crores in the course of five or ten years?—Well, sir, it will be this way. Absorption has been going on year by year in pre-war years, and it was made up by means of fresh issues of currency, new rupees and the new note issue and so on. Hereafter, with a scheme such as I have advocated, there will also be fresh issues of currency against the gold tendered and if rupees are absorbed there is likely to be fresh currency going into circulation and making up for them. It may happen, sir, that in ten years' time we may find that the rupees have been materially reduced.

3601. We are looking forward to a period when it will become an obligation to give gold against rupees and notes, and you say the active circulation would be decreased?—I don't mean that, sir. Do you mean "of rupees"?

3602. Is that a material circumstance? The material circumstance is not the active circulation, but the amount of rupees actually outstanding, because, if you have the obligation to pay gold out against rupees, that is an obligation against any rupees that may be outstanding, whatever purpose they may be put to.—I entirely agree. My point is that by that time the people will have become fairly familiar with the new system and with the gold currency, and the majority of those who hold these rupees —because it is the poorest classes who hold the smaller units, the richer classes will hold something else—they perhaps would not know very much about it, and once the store of value is put in the old stocking, it will remain there until it is taken out for spending.

3603. You think you may get off lightly, and that not many rupees will be tendered for exchange?—That is why I do not suggest any period in the memorandum.

3604. In the first place, I understand that at this point, when you give gold against rupees, you are also going to limit the legal tender of the rupee, when you make it obligatory?—Yes, then we should have to limit.

3605. Is that not going to have a very strong effect indeed in bringing rupees back for changing into gold? What about the people with hoards?—I hope the Commission will bear very clearly in mind that hoards means a very different thing here from what it does in Europe or America.

3606. Let us drop the word and put it this way. When you limit the legal tender of the rupee, will that not be the strongest possible reason why all those who hold rupees as a store of value should restore them for exchange into gold?—What will happen,

sir, is this. The largest holders of these stores of value are supposed to be the many small States, feudatory and otherwise, in this country who hold very large amounts. But even there, Sir Antony MacDonnell, who gave evidence before the Herschell Committee—and he was a very able official of those days, he had gone right to the top as Lieutenant-Governor of the North-West Provinces—he was of opinion that the States did not hold such enormous amounts in hoards as had been commonly imagined. Then, he also thought that the various zemindars, who are something like the squires in England, large gentlemen landholders, they were supposed to hold very large amounts, but he and some other witnesses also were of opinion that that also would not be very correct, except in a few exceptional cases. So, what will happen in the next ten years, if I see the situation aright, is this. These big landholders are wide awake. They know what they are about. They will, some of them, be very carefully studying the report of this Commission to find out what is going to happen in the next ten or fifteen years, they have got very able officers to advise them, and they will go on quietly converting by first exchanging rupees into notes and then holding the notes, so that some day they may claim gold against them, whenever the gold payment was made obligatory. You would not be demonetising the notes, you would only be demonetising the rupees. Then the only holders we would have to consider would be the small men, and my suggestion is whenever we may have to consider the quantity of legal tender, we will have to put it a good deal higher that what it is in England. In England it is 40 shillings. I don't see why it should not be 400 or 500 in India. Because it does not really matter. A man who has a claim for Rs. 500 against another is not the man who has to send out that money to a foreign country. He goes to his banker and does it through him. So, as far as the internal payment is concerned, if the local limit of payment is fairly high, the bulk of these holdings, which I believe are with very small people and in small amounts, will not be disturbed. They won't go out.

3607. One has, of course, in considering what is prudent, to consider what may happen at the worst?—I agree, sir.

3608. Might it not be said that it is equally possible that as soon as the policy was announced by the Indian Government of ultimately limiting the legal tender of the rupee, immediately all the holders of silver hoards would take fright and throw their hoards on the market?—You mean on the Indian Government expressing that opinion to-day or ten years hence?

3609. I suppose one must contemplate that, if the Indian Government adopts a policy of finally paying gold for rupees and limiting the legal tender of the rupee, it cannot keep it dark. It must announce its policy?—That is why in my scheme I do not say when the rupee should be made limited legal tender and I have gone further.

3610. My point is this. Supposing the policy is announced by the Indian Government that ultimately, five or ten years hence, the rupee is to be limited as legal tender, might not that, in your opinion, lead to an immediate rush on the part of holders of hoards to anticipate that limited legal tender by getting rid of their rupees?—But they would only get notes under the proposal I put forward.

3611. They can only get notes from the Government, but, on the other hand, they could sell their silver on private account?—But the silver, if it is sold on private account, may not get them 9 or 10 annas. I am sure large holders would not do that.

3612. Now let us contemplate the arithmetical quantities with which we are dealing. Your scheme is that the shock of the dethronement of the rupee should be absorbed during the period during which gold is optionally given out. Nevertheless, it should be possible to form an estimate of the amount of gold which would be required from first to last for the whole period. Have you attempted to make such an estimate as to the amount of gold which India would require from the world at large for the period which you allow to carry out the policy which you suggest, supplementing that policy with what you have told us now about the proposal for the final expense of the obligation to pay gold against rupees and notes?—Well, sir, I have not done it. But if you wish it, I will give you some off-hand indication of what I think possible.

3613. I think that would be of great interest?—If you will permit me, with the proviso that I have not carefully worked it out—I don't think it very possible to come to any valuable conclusions about that amount to-day, because we don't know what may happen ten years hence. The total circulation may be a very big figure, and then the two or three hundred crores which are to-day supposed to be somewhere in circulation would not be 50 per cent. of the total, but perhaps 25 per cent. or 20 per cent. I hope I am clear there.

3614. No, I am not quite clear. Have we not to take as the basis of this calculation the total amount of rupees outstanding which are likely to be returned?—If you will allow me to complete my argument, possibly it will answer what you have in your mind. My argument is this. To-day the total circulation is 200 crores in paper money, and 200 crores in silver money, call it 400 crores. So that silver money is 50 per cent. of the total. It may happen that 10 or 15 years hence the proportion of silver money may be much smaller. It may not be 25, it may be 20 per cent.

3615. You mean, in exchange for notes?—No, not having been exchanged for notes. The total circulation having increased. It is bound to increase in this country year by year to a certain extent, the total circulation of money. The currency figures here will show you that this increase must occur and the currency figures in other countries will show the same thing, including England. Then we may find that these 200 crores of rupees that now form a very large portion of the total circulation would form then a smaller portion. That would be one thing. And then it may also be found that these India's shillings are so necessary for the small payments in the country that people do not come back and there is no chance of their being exchanged for gold. So I think it is rather unnecessary at this stage to go into any figures, but I would personally, if I had to do it, say that if we had been able to build up a reserve of something like 60 or 70 per cent. of the paper money issued, that is, of the 180 or 190 crores that are to-day in existence, then undertaking the obligation will not put us into any greater risk because a good deal of the money will not come back at all.

3616. 60 or 70 per cent. of, say, the 200 crores of note circulation?—Yes.

3617. That is 120 or 140?—Yes, but that is not to be built up to-day, but to be gradually built up.

3618. And that reserve has got to bear, as it were, the burden first of all of maintaining the internal convertibility of the note; secondly, of maintaining the exchange value of the external currency; and, thirdly, the varying burden of the final exchange of gold for rupees presented?—I agree. The only proviso I would add is that the measure of each of these burdens is very difficult to decide to-day.

3619. Of course, it is a comparatively easy matter to calculate what reserve it is prudent to keep to maintain the internal convertibility of the note. Experience teaches what percentage is wise for that purpose?—I am afraid the percentages do not refer, as I understand them, to the internal convertibility, but to the convertibility in foreign payments. The reserves in all the gold standard countries are supposed to be for both, but it has been found by experience that the man who holds a piece of paper or note does not change it into metal coin merely

for a whim, while the man who has to make payments to somebody outside the country has no option but to do it, because outside the country nobody will take that piece of paper. So I would say regarding the percentage of the reserve that you hold, if it is sufficiently large, then this risk of rupees being tendered and being immediately converted into gold may not be considered very serious, but that will only happen if we have a large reserve.

3620. Might it not be suggested that there was something, perhaps, of an element of speculation in relying upon such a small demand for gold as that for which you allow, and that it would be impossible, on the grounds of prudence, not to take into consideration the fact that the demand might be the maximum demand which could be made, and that, in a matter of such vital moment to the commercial and industrial welfare of the country, one ought not to run any risk?—If that is to be considered a very serious risk, then one of the solutions would be to imitate France or Holland and let the present rupees remain unlimited legal tender, so that there would never be any question of their coming in for conversion; a holder would not go in for conversion if he felt that the rupee was going to keep its value for all time.

3621. Before we examine that suggestion, let me put to you one or two figures without asking you to accept them. Will you tell me what would be the various effects to which I will refer if these figures were in fact justified? Let me put this figure to you. Supposing that the total amount required to carry out the scheme which you have outlined, the ultimate acceptance of the obligation to repay rupees in gold, were from first to last an additional roundabout 100 million sterling of gold, to be drawn to India from the rest of the world; granting that figure for the moment in order to examine the various possibilities, are you prepared to express any opinion as to what effect the withdrawal of that amount of gold from the other gold-using countries of the world would have upon general gold prices, and, through general gold prices, what effect it would have upon the welfare of the Indian nation?—Well, sir, there again, if you will permit me to divide the question into several parts, first of all, if we had to draw a hundred million pounds of gold from the world's stock, then we would have to consider the consequences, and some of them would be certainly very serious.

3622. What would the consequences be in your opinion?—Then I will answer it that way. If you are going to draw away 100 million pounds from the world's stock of gold, of course that means monetary gold.

3623. It is gold metal that we are talking of?—Well, gold metal will only come out of the mines gradually; so if you want to have, say, 100 million pounds all at once, you can only do it by drawing on the world's monetary stock. Then, sir, that would mean that the foundations of the credit, industry and finance in every gold standard country would be weakened because some of the bricks in the foundations would be drawn away and the superstructure may be too heavy for what remains and that might lead to very serious consequences, because if the gold standard is correctly operated, then the only consequence would be a serious contraction of the credit in every country which has given us some of this gold to make up that 100 million. That would undoubtedly lead to a very serious crisis both in banking and trade.

3624. What would be the effect on prices?—The answer I have given about trade would give the answer about prices, because there would not be a serious crisis in trade unless commodity prices collapsed and merchants made heavy losses and could not meet their engagements. Now, sir, there is an aspect of this question which I would like to draw your attention to, that the probabilities are for a continuous decline in prices in the next 10 or 15 years. That is not merely a fancy; it is what has happened after big wars. I know that the commonly-held opinion is that it is merely the increased money that raises prices, but if we could go into the facts it would be found that it was every war that raised prices, that it was every period of peace that depressed them; and the bigger the war, the bigger the depression and the longer the continuance, and that is mainly because—I hope I am not digressing because I am trying to answer the question about prices—the reason being that during wars Governments spend lavishly, we might almost say thoughtlessly, the only thought they have being to win the war, and it does not matter what they pay for it, and such a big buyer with an unlimited purse coming on the market puts up the prices of every commodity.

3625. You are telling us that, although the withdrawal of this great quantity of gold for Indian purposes might have one effect, yet there may be world influences which are tending towards another effect?—I was only drawing attention to the fact that when prices fall and we are in a period of long trade depression, we might be told that it was India's drawing away gold to the extent of 100 million; everybody might say that it was the effect of that; but that would be taking absolutely a wrong view of economic history. We had the same series of a decline in prices after 1873. It went on right up to 1890, and then we had the gold and silver commissions and so on. Such a period we are in front of, and we are going to face. So, if the withdrawal of a large amount of gold all at one time is at all contemplated, then my suggestion, sir, is that this is a wrong moment for it. We would be very seriously accentuating the gradual decline in price levels which is before us for the next 10 or 15 years, until an increase of the population, and an increase of the needs of the masses of the population, adjust the demand again to the supply. To-day it is not adjusted. So if I had to do it, I would certainly not think of trying to draw anything like 100 millions from the world's monetary stocks to-day. What I would do is to allow India to draw what currency gold it can in the ordinary course of trade year by year, and that would not be felt, because the mines of the world would be bringing out new gold and some of it would come to India, and it would not disturb the foundations of credit as it exists to-day.

3626. Let us now look at the other side of the picture. Ultimately, on the adoption of the measures which you recommend, as I understand it, silver would not be required in the reserves of the Currency Department?—No, sir. In my scheme I have left the silver rupee as part of the reserves, but no fresh silver will be required. If your question is, "no fresh silver will be required," then I agree.

3627. We have introduced really a further step into your calculations, that is the stage when the obligation is accepted to give gold against rupees. If we look forward to this stage, will there be any necessity to keep any silver in the reserves?—No.

3628. Ultimately, then, on the fulfilment of your proposal, there will have to be a disposal of the silver in the reserves. What, in your opinion, would be the effect upon the silver market of the world, first of all if we assume that whatever silver is held as stores of value in India is turned out and becomes no longer required for that purpose; and, in the second place, if the silver which is now held in the currency reserves of India is no longer required for the purpose? What will the general effect upon the silver market of the world be of the increase in the supply of silver?—There again we are trying to guess the position ten, fifteen years hence and silver is not a thing that can be grown like wheat. It is a thing that comes out of the mines and fifteen years hence we might find that some of these mines had less production than they have to-day. Then if that silver that India will be holding in the shape of ornaments or rupees which have been demonetised were to come upon the market, it may not have the

same adverse effects which it has to-day, when the supplies of silver are ample. I personally feel that part which is held as ornaments will not come on the market at all, except for a very, very small fraction; because so long as there was some other kind of money in store, a rupee note or sovereign, people would use that money rather than go and sell ornaments, and there has been this curious feature about India, that apart from currency experience, in the last fifty years, possibly with one exception, India has been an importer of silver for purposes of ornaments and so on. Every year India has gone on importing silver. Possibly with a fresh growth of wealth it might be that these wants in the matter of silver also might grow larger and so if we have to consider the problem of silver coming on the market 10, 15 or 20 years hence, it may not be as serious as it will be to-day. And I personally do not see why even when you demonetise the rupee you should not go on holding the bullion for a considerable time until we come to a favourable opportunity. The American Government got its opportunity in 1920 and we might get our opportunity, say, in 1940 or at some other time. Our cost of silver is mainly 32 to 35 pence, if I am not wrong, as far as the currency silver is concerned, excepting the amount we bought at one dollar.

3629. Finally, with regard to the amount which will be required on this future date for the substitution of rupees in currency, is not the sale of the silver in the currency one of the principal means by which that gold would be paid for?—I would not advocate that. If I may be permitted to explain that again, that will have its effect on world prices. To-day we have a big country like China still on a silver basis and trying to throw silver on the market means depressing silver prices, which means upsetting the economic system of China, and considering the size of the country and the requirements of the country, it might be that any such state of affairs would seriously upset the economic position of the world and it would be much wiser for India to suffer a very small loss which the holding of that silver would put on it rather than a far bigger loss which a general upsetting of trade all over the world would involve.

3630. Let us see what the practical steps are that you recommend for increasing the gold reserve in order to meet these future obligations. I understand that they are described in your memorandum, where you say that the practical step which you recommend for the realisation of the further gold reserve is that local currency should in future be issued only against gold. That is, you rely upon the import of gold in good years?—Exactly, on trade balances.

3631. Its tender to the Government and the issue of notes cent. per cent. against gold. I understand that this is the only form of future increase in the local currency?—Exactly.

3632. I am not quite sure that I follow what you mean. Would not that result in a steady increase in the percentage of gold in the reserve?—It is bound to, Sir. It will be like this. Supposing we have a hundred crores of currency and say 40 crores of gold, that is, a percentage of 40. Assume that to be the position to-day. Next year, there is an addition of 10 crores of currency against 10 crores of gold, say. Then it will be 50 against 110 and you could see it is a larger percentage than 40 and that way the percentage is bound to continually improve until we come to a very adverse trade balance which comes only perhaps once in ten years, when we might find that that steady increase has stopped or there has been a fall.

3633. What effect would that have upon the elasticity of the currency, or would it be inelastic?—How inelastic, Sir?

3634. The increase in the percentage of gold?—There is no question of elasticity there. Any one who wants further currency would be able to get it by bringing gold. Commodities would be exchanged for gold by bankers and the bankers would exchange it into local currency.

3635. Why do you assume that the gold would be tendered under these conditions to the Government? Is it not apt to come in in the form of purchases on private account for ornaments, etc.?—I would point to what has happened every year including the current year. There is always a need by bankers, apart from such gold and silver as they can import and sell in the bazaar for ornamental purposes, for currency and thus they are obliged to go to the Government to get currency, because Government is the only party that can issue such currency. Even within the last month I believe they were obliged to tender 3 or 4 million pounds and in the last few months they have tendered many millions and some of them Government has put in the reserves and issued currency. But what Government has received is sterling. What I would do would be to tell the bankers, 'we do not want sterling credits; we want gold', and they will be obliged to get it. It would not come from England, I may add that.

3636. That is the only step you would take to accumulate gold, and, as I understand it, your policy would be to await the effect of these measures in regard to the accumulation of gold before you proceeded. The first step would be during the optional period?—The first step would be the giving of gold against notes. That, I may state, could be done even from to-morrow, that is, from the time that this thing came to be adopted; because so long as there is no panic or war, very few people will care to go for gold and the bank can spare a few millions.

3637. As I understand it, the cost of your proposal will be only the difference between the loss of interest as a result of adding to your reserves and investing less in securities?—I do not agree with that word 'cost.' When I tender one sovereign to the currency office and take away one piece of paper, that sovereign belongs to me and the Government has not worked for it or earned it and it has no business to invest and earn interest on it. If it does, it is trying to make money out of currency. There is no cost to the Government at all. I do not agree there.

3638. That seems to me to raise not so much the question as to whether it is an expense or not as to whether it is a legitimate expense or not. If you act wrongly, as you say, and invest your gold, you would get interest on it, and if you do not invest it you will not get any interest upon it?—But the difference will be not whether it is a legitimate cost; but whether the Government was taking a legitimate profit or not; I would put it that way.

3639. To complete the picture, let me put one or two more questions. You are in favour of the transfer, in the manner in which you describe, of the control of the note issue to the Imperial Bank of India and you are in favour of the minting of an Indian gold coin. Your reasons are fully stated in the memorandum. If there is anything else you wish to add to them you may do so now?—There is a considerable body of opinion that would welcome a ten-rupee coin, although I say that I do not think a ten rupee coin necessary. If Government find that the body of opinion is more in favour of a ten or twenty rupee coin rather than a fifteen rupee coin, I have absolutely no objection to that.

3640. You see nothing unsound in it?—No.

3641. But it would not occur to you that it is necessary?—No.

3642. Then I see that you are in favour of the issue of small notes of the denomination of less than Rs. 5? You say, 'special facilities for the encashment of the One-Rupee Note into small change should be created.' What exactly are you referring to when you mention these special facilities for encashment?—I think a good deal of what is supposed to be the unwillingness of the masses to accept notes is really due to the fact that they lose

some money when they have to cash them into small coin. In the rural areas even a five rupee note is too big. Even to change the one rupee note, the village moneylender charges some money. What I advocate is that this small change shonld be freely made available in some organised way in many centres of the country, particularly in leading bazaars and hâts; by hâts, I mean what we call fairs in England on market days. And then every holder of the note should get whatever change he requires without having to pay any discount for it. There is in this connection a matter which I would draw attention to. I understand that the railways of the country are acting as a drain for small change from the interior to the big towns. The system is that every station master has to put all the money that he gets into a bag, seal it and send it to the audit office. This means that every day a good deal of small money is drained away from the various stations all along the line, to Bombay or Calcutta. I point this out to show how these notes are made unpopular with the masses. They feel that they have to pay a farthing or whatever it is if they are to be cashed. Even such small notes are of great value in this poor country and I would advocate that these matters should be looked into and the drainage of small change should be stopped by arrangements for the payment by the station masters to some local shroff or banker, and every decent town has either of these, and the currency office also should make further arrangement to make getting of small change easy and free of cost.

3643. Taking another of your proposals in paragraph 12 of your recommendations, what emphasis do you lay upon the recommendation that the gold standard reserve and the paper currency reserve should be kept separate, assuming transfer of the control of the note issue to the Imperial Bank?—Well, Sir, I first of all think that if we have transferred a part of the gold standard reserve in the way I have suggested in my scheme......

3644. You have taken 10 millions?—Yes, Sir. And then the rupee securities would be 20 crores; the total issue to be covered by gold or gold securities or silver coin excepting for those 20 crores which are to be considered a minimum holding of Government of India paper. Now if the reserves have got to be amalgamated, then there would be no objection in principle provided it is very well understood that the gold standard reserve was really the reserve at the back of the silver note, not at the back of the paper note.

3645. Provided, that is, you make some allowance for an increase of the liabilities against which the combined reserve is being held in respect of the necessity for covering the exchange value of the silver notes?—Exactly, Sir. Now my suggestion is that if it is at all going to be done it may be done as follows. In my scheme I suggest that 90 crores of silver coin may remain in the reserves. Some part of it may be taken out and treated as part of the gold standard reserve, and the sterling securities that we now hold in the gold standard reserve should be amalgamated with the other sterling securities in the paper currency reserve. There will then be rupees only in the gold standard reserve and it may be simply called a reserve of rupees. I have provided for silver rupees to continue in the paper currency reserve because in my scheme I propose encashment to be optional in gold or silver rupees, and if you have that optional encashment for internal purposes, then you must have some rupees in the reserve, otherwise how are you going to do it?

3646. In paragraph 16 you say the Imperial Bank should not be allowed to do any foreign exchange business. In your opinion can a Central Bank discharge its essential functions as regards the note issue without any dealings in foreign exchange?—I think it can, Sir, unless you or any other gentleman can tell me that the Bank of England has to do it. I know the Continental banks do differently but I think it is a thing which is very likely to lead to abuses as in fact it has done in France to-day; one so easily slips from holding of foreign exchange securities, etc., to further and graver errors.

3647. In paragraph 18 what is your reason for limiting the provision for remittance to the actual requirements of the year? Why, for instance, should not the Imperial Bank, to which you recommend the remittance business should be transferred, take advantage of a favourable situation to save the Government money by making provision ahead for its requirements?—Well, Sir, that has been done and on the same ground, although of course it was done by Government in pre-war days. It was argued that a good rate of exchange was being obtained, and so we remitted more, and enormous balances were built up in England. I think that unnecessarily large balances have been held by the Secretary of State in England, and I do not think it is the right thing to do.

3648. I understand that that is involved, in your opinion, in the general policy regarding balances?—By remitting more than his requirements it increases the balances held by the Secretary of State.

3649. You say in the past the balances have been swollen to an exaggerated extent to the detriment, in your opinion, of the financial situation here?—Yes, if I may be permitted to elaborate that.

3650. I am just finishing the point I wanted to ascertain. It is really, is it not, a question of degree? You are not, as it were, wedded to this proposal as regards the limit of the year as long as any relaxation of that limit does not allow the amount held to be accumulated to a provision too far ahead?—Well, Sir, that is what I was trying to make clear. The Secretary of State is not a party on whom demands for payment are sprung unawares. All his payments are known some days, months and even years in advance, because there are interest payments on given dates, pension payments on given dates, etc. Even his merchandise transactions such as the purchase of railway and other stores are not things for which payment is sprung on him. He has ample time to prepare for it. So if he had a balance of a million or two in hand I think that should be ample. In fact, I would not even think that necessary. The English Government has arrangements, what are known as Ways and Means advances, with the Bank of England, and I do not see why the Secretary of State could not have the same kind of arrangement either with the Bank of England or some other Banking agency by which if a sudden demand springs up, which I say cannot possibly occur under the system on which he is working, he could draw half a million or a million pounds. Even apart from that, Sir, he could put out six months or year bills as he used to do before 1910. I do not know if bills have been put out in the market after that. He could get money on very cheap rates. Taking very large amounts of money to England and holding them in hand simply because some day you might require them is I do not think a sound method of financing.

3651. (*Chairman.*) I will postpone for the present, if I may, the questions which I wish to ask about the ratio of stabilisation. I will ask my colleagues if they have any supplementary questions to ask on this part of the subject.

3652. (*Sir Reginald Mant.*) Mr. Madon, I understand from what you said in reply to the Chairman that you would not attempt for some years to introduce a gold currency in this country?—That is, not the obligatory circulation.

3653. Owing to the disturbance that would be caused in both the gold and silver markets if we tried to acquire at once a large amount of gold and to dispose of a large amount of silver?—Yes, Sir.

3654. You anticipate that if we wait for some years the situation will be eased in both those respects?—Not in the second respect, that is, selling of the silver. The question of selling silver may not ease in 5 or 10 years; we might have to wait longer. In

the matter of the stock of gold I think in 10 years we shall be in a happier position.

3655. I was not taking 10 years; but if we wait long enough both difficulties will be eased?—Yes, Sir.

3656. The surplus silver will to some extent be absorbed?—Yes, Sir, that is my view.

3657. And the country will have acquired a considerable stock of gold?—Will you permit me just to expound this part of the silver question. The production of silver does not depend curiously as it happens on the demand for silver itself. It really depends on the demand for lead, zinc, and copper. That is, if these three metals with which silver is found in very small proportions, are selling at very good prices, then mines are worked for these metals of which silver is only a bye-product, and more silver is to be had in the market. What I want to emphasise is that during the War, and since the War, lead and spelter have been at much higher levels than in pre-war days, so the mining has been pretty active. It might be that on a decline in the prices of some of these metals some of the mines would have to curtail their operations or even shut down; and it is these mixed mines that are to-day the largest sources for the supply of silver. That is possibly one way in which we might find 10 or 15 years hence that the supply had been curtailed and the additional supply that India might then put on the market could be easily absorbed without any disturbance.

3658. Also you anticipate, do you not, that India's surplus stock will have been considerably reduced by that time?—Stock of what? You mean of silver rupees by absorption?

3659. Yes. There is a continual absorption going on not only by hoarding but by the increasing need for rupee currency?—Yes, Sir, in both ways.

3660. So that the surplus stock which India now holds will have been considerably reduced?—Yes, Sir. I would put it that way.

3661. I just wanted to ask you one or two questions which seem to indicate a few dangers to achieving that object. You said I think that if we announced a policy of demonetising the rupee in future, that is, restricting the legal tender of the rupee, some far-seeing holders of rupees would change them for notes?—They may.

3662. That would cause some embarrassment for the time being in increasing the Government stocks of rupees, would it not?—Yes, but that would not be an embarrassment. I do not see why Government should be embarrassed because it has to keep charge of so many rupees.

3663. Let me put it this way: it would decrease the absorption and increase the period before which you could introduce your gold currency?—Yes, I see your point. If the rupees come back then there will be less remaining out of which absorption can go on. I believe that is your point. If that is so, on the face of it it is correct. I have got to agree to that.

3664. And now when you undertake the obligation to provide gold for notes, would not those notes be an additional obligation? Would they be likely to be presented?—Entirely, every one of them.

3665. That would operate to delay the period. It is not an insuperable obstacle, but it is there. It may delay the period?—I personally think we cannot form any accurate opinion until we have had some experitnce of the new system.

3666. And you gave us an interesting account of the demand for gold in the shape of ornaments for women. You told us that notes are now being used largely as a store of value, for being hoarded. I presume there is no chance of notes being substituted for those ornaments?—Not for ornaments, Sir.

3667. Not for use as ornaments but as a store of value? Because I understand the ornaments become the property of the woman?—Yes.

3668. While the notes will not be so?—No, unless they are a sort of gift, as when a father gives fifty or hundred rupees in notes to his daughter as a gift, but the general practice is at present at least to give it in gold, except perhaps in big cities. On that point Sir Purshotamdas knows naturally far more than I do, and he will be able to enlighten the Commission more accurately. But what I have found from my own investigations is this, that except in big cities where not only men but women and children have learnt nowadays to understand what shares and securities are, and where such gifts of paper either as currency notes or investment paper are fairly common, if you take the bulk of the population all over the country, I do not think that it is at all common; the gifts are mainly of ornaments.

3669. If they take the shape of notes, they would still remain the property of the woman?—Yes.

3670. You said it was part of your scheme that you would make it obligatory in the first instance to give gold for export only?—Yes.

3671. While Government would retain the option of giving gold for internal purposes?—Yes.

3672. How would you secure that that gold was exported after being given out by Government?—I have said that it should be given for export, and the best indication would be that exchange would be at the lower gold point.

3673. (*Chairman.*) In paragraph 7 of the summary the witness says "and at the gold export point only"?—And in the body of the paper where I talk of giving gold for foreign payments I point out why at the gold export point, namely, that when we are at the lower gold point it means that the country does owe payment abroad, and then the gold if it is drawn would be most likely to go abroad. Then also the authorities would know or at least could form a fairly accurate judgment of where the gold was going from the party who applies for it; and in normal times, that is barring any panic, the bulk of the applications will come from banks.

3674. (*Sir Reginald Mant.*) You do not think that there would be any serious risk of the gold going into internal circulation and not being exported?—If it goes it would simply mean that the export was not needed. But as we are not to-day going to put an embargo on the import of gold or silver bullion, any demand from the interior for gold as gold can be freely supplied by the ordinary importing channels. So I personally think there will not be much danger of somebody surreptitiously cashing notes and taking the gold away into the interior when he pretended he wanted it for export.

3675. You do not think it is likely to be a drain on the Government gold reserve?—Because here will be no embargo on the import of gold.

3676. Turning to another point, you have said that you anticipate a considerable fall in gold prices for many years to come, and you said that that always happened after a war; and you instanced the course of prices in 1873; that was after the Franco-Prussian war?—Yes.

3677. Is there not another factor that has a very considerable effect in those long changes of price levels, namely, the supply of gold, and was not that one of the main factors in the course of prices after 1873, was the fall not due largely to the demonetisation of silver on the Continent and a greater demand for gold?—Well, Sir, I know that argument has been constantly put forward; but if you do not look only at that period but go over the history of the last 150 years, say from the French Revolution, you find something altogether different. If I may be permitted to show you a chart of prices, it will make my meaning clear. (*The witness here handed a chart* to the Chairman.*)

3678. (*Chairman.*) This is a chart of commodity prices between 1782 and 1923?—This chart brings out two curious facts, both of which undoubtedly seem to have considerable influence on the level of prices. One is that at the very start of every war there is a sudden depression; then while the war is progressing prices go soaring up; and when peace comes the prices come down and this occurs again and again. You can see that very clearly after the French Revolution period; you can see that on a very small scale in the Crimean War; you can again see it in the United

* Not printed.

States War of Liberation; you can see it in the Franco-German War; and in more recent periods you can see it on a very small scale in the China-Japanese War and so on and then in this war; but there is again a small period between that and the Balkan War. It began in the Italo-Turkish War of 1911 and went on in 1912-13; you find a depression from 1910 to 1911 and then a rise till about the end of 1912 when there was talk of the Balkans signing peace and in 1913 when peace was actually signed there was a depression. That is one thing which seems to appear as an important factor from this chart. Then there is another very curious thing which I am quite unable to explain; but there seems to be some kind of periodicity in crops, because ultimately all new value on which new credits can be built up is produced by crops or output of the mines. You will find there in that chart that curiously the year which has '7' as its last figure is a panic year. You will find that in 1817 and 1827; the 1837 panic was well-known; there was a small panic in 1847; so in 1857; in 1867 there was a violent panic; in 1877 there was a small panic and it was attributed to various causes including the purchasing power of India having been disturbed by famine. 1887 is the one year where I cannot see any panic; then we had 1897 and 1907 and so on; I do not want to say these are mathematical things or that we should be superstitious and that 1927 and 1937 are going to be panic years; but these two things I draw attention to in order that too much emphasis may not be placed on what is called the Quantity Theory of money,* where the fundamental idea is that the moment you put more gold into the market, prices go up and the moment there is less gold prices come down. I do not think that is correct.

3679. (*Sir Reginald Mant.*) But you are not rejecting——?—I entirely reject it.

3680. (*Chairman.*) But you have not heard what you are rejecting?—I will tell you this, if you will allow me to explain. Sir Reginald Mant wanted me to admit the position that a decline of prices was not due to the effects of the war and the long period of peace but to decrease in supplies of gold. That is why I brought this out.

3681. (*Sir Reginald Mant.*) I asked you whether the supply of gold was not also an important factor in the course of prices?—I would not say important, Sir; because without a supply of gold, prices have soared up and with supplies of gold they have gone down. In the last four years in America, from 1920 to 1925, the supply of gold is larger, the supply of credits is larger, the supply of bank deposits is larger and everything is larger; but prices are 50 to 70 per cent. lower.

3682. Has not America taken steps to sterilise that gold to some extent?—I do not see that; that is another thing that the exponents of the Quantity Theory put forward in order to show that they are not wrong; actual sterilising would be to bury the gold and not use it anywhere. What America did was different; they put that gold into circulation; they issued what were called gold certificates, and those gold certificates acted exactly like any other money as the basis of credit, with this one difference that if they had been kept by the Federal Reserve Board then there would have been 80 per cent. gold against 100 per cent. note-issue while as it was it was 100 per cent. against 100 per cent. But that was a very minor factor; still allowing for all that, if you pay any regard to the total amount of money and equivalents of money in circulation to-day in America and in 1920 you cannot explain it in any possible way on the basis of the Quantity Theory of money. I do not want to go much deeper into it because it may take up the time of the Commission.

3683. There is only one other point that I wanted to ask you about, and that was about Government remittances. I understand from what you said to the Chairman that your main object in limiting the Government remittances to the year's requirements was to prevent the accumulation of large balances in London?—Which would be lying idle.

3684. Am I right in thinking that you would not prevent the Secretary of State from anticipating his requirements for the next year to a reasonable degree??—I believe I tried to explain in reply to a question by the Chairman. I tried to point out that the Secretary of State's payments were all such as could be foreseen weeks or months ahead and therefore he could always put himself in funds in good time to meet all those payments. If he felt that there might be difficulty, he might have a million or two in hand. I would prefer him to have a working arrangement for ways and means credits with the Bank of England, and then there would be absolutely no need to have very large amounts in hand. If you say a million or two I have no objection.

3685. But if a merchant knows ahead that he has to make certain payments abroad and knows that by taking advantage of a favourable rate of exchange he could put himself in a position to meet those demands more cheaply, would it not be the natural and reasonable thing for him to do?—May I point out the difference. The difference is this; that the merchant simply makes an exchange contract; he does not remit money long in advance. If I have bought anything and I think I ought to cover my exchange for meeting it when the shipment is going to be made, I go to the bank but I do not remit the money actually. What I want the Secretary of State in one of my recommendations is to do the same thing; I say that the Government should also contract for forward deliveries of exchange. That is just the answer to your point. If Government think that a particular rate of exchange is favourable then they may contract, by all means. But not remit money out of India.

3686. Can you refer me to that?—It is in paragraphs 17-20 of my summary.

3687. You would allow the Secretary of State to contract forward?—I would allow him to contract forward but not to remit forward. I have, in the body of the paper on which this recommendation is based, explained further that, if this forward settling is adopted, then most probably the Secretary of State would be getting favourable rates for council bills in May, June, July and August. In the case of the bulk of foreign trade in India the goods bodily, physically, go out in January, February, March. But the sales are made in May, June, July, August, September, perhaps and then some part actually in the season—because merchants have to anticipate, and particularly in foreign countries they want to be sure of their goods at the right prices. So if the Secretary of State adopts the policy of contracting his exchange forward, and say in May he says: I am going to buy at the rate of 2/16 but I will also be prepared to contract for January forward at 3/16, it might be found —personally I am sure it will be found—that there are takers for it. He will find a profitable rate and he will not have to lock up money for it.

3688. (*Sir Henry Strakosch.*) Mr. Madon, you will agree that, especially in view of what you have told us regarding the ill-effects of a drain of gold from gold standard countries on the stock of gold moneys and the ill-effects of a material fall of the silver price, it is essential to appreciate the effect of introducing into India a gold currency such as you suggest. We have to weigh, I take it, you will agree, what the total amount of gold may be that will need to be introduced into the country?—By what time, Sir?

3689. I will come to that in a minute. The total amount of gold. Then, a very important matter we have to consider is the cost to the country?—I don't agree that there will be any cost, Sir. I tried to make that clear in my reply to the Chairman.

3690. You don't appreciate the point?—If you will tell me where exactly the difference is, I might be able to explain, Sir.

3691. You propose, having regard to the ill-effects of a great quantity of silver coming upon the market, to retain the silver for a long period. Now, on introducing gold currency into this country, what do you

* *See also* Appendix 18.

imagine would happen? How do you think the gold will go into circulation? I suppose in exchange for either rupee coin or notes?—Possibly, Sir.

3692. Very well. If it has the effect of bringing out rupee coin in exchange for gold, the amount of gold necessary for that purpose will have to be provided by other means than the sale of silver?—Exactly, that is what I propose; not by the sale of silver.

3693. Now then, if that were to take place, how do you propose that the Government of India should finance the introduction of a gold currency?—Well, Sir, I am afraid I don't exactly understand but I will try to answer the question as I understand it, because I don't see where the financing comes in at all. Under my scheme every new unit of currency issued will be against a unit of gold paid into the reserves and therefore for every further issue the gold will be automatically there. For the issue as it exists to-day—and some part of it may want encashment—I have purposely suggested that the obligation to convert the local currency into gold—that is exchanging notes for gold—should not be undertaken for a period until we are able to see the situation more clearly.

3694. Do I understand you rightly, that you would introduce gold currency into the country only to the extent that the savings of the country would enable gold to be tendered which would then go into circulation?—It would not be savings. It would be the balance of trade of the country which has got to be brought in. It may not be all savings which the balance of trade brings in—it may belong part to you, part to me, and both of us may want to spend it after it has been brought in. Both of us will be bringing it in cash, that is in gold.

3695. In other words, you want to utilise the surplus of the balance of payments to be brought in and put into circulation?—May I point out that 'utilise' would not be the correct word. That will be the only form in which it can be brought in, because, after we have brought all the goods that we want, all the services that we want, our balance that remains due to us has got to be brought in in cash. It will not be a utilising of the balance we have, but the only way in which we could settle it.

3696. I appreciate that, but, as you are no doubt aware, India is absorbing every year a very substantial quantity of gold, and, on the supposition that the habit will be continued to import gold on private account to be put away in hoards and not to be tendered, how would you put gold into circulation?—Well, Sir, that does not require any guessing. We have the facts of the pre-war periods and even the facts of to-day before us, that every year a certain amount of gold and silver are imported as bullion and taken into the interior, and a certain amount has to be imported and converted into currency. It was what happened in pre-war days. It is what will happen hereafter.

3697. But would you agree that in these few years after the war, by far the major portion has gone into hoards, for what reason we will not now inquire?—Well, Sir, you have put a proviso which makes it difficult for me to reply. The only reason was that the Government of India would not permit it to be converted into currency.

3698. But let us go back to the pre-war period. How much of the gold which has been imported for private account would you say has been tendered in exchange for currency?—Well, Sir, in pre-war days silver was supposed to be divided into private account and Government account. And gold also, when Government took it over from some point outside India, it was supposed to be on Government account when it came in. But it was merely a convenience, there was nothing in the Act to prevent the banker keeping the gold all the time until he brought it into the currency chest. What happened was that the Government said: We give you rupees immediately to-day. Tell us that the gold is ours and bring it to us. The banker from that moment had the rupees, which enabled him to make that currency immediately available for his purposes before the gold could be brought in here, which might mean 10, 20, 30 days perhaps more. So, all the gold that went into the Currency Office and was converted into currency at any rate was gold imported on private account, because it came in as payment for the balance of trade. It was not paid for out of the revenues of the Government of India.

3699. What I want to know is this—how much of the gold has actually been tendered for conversion into currency before the war?—A great deal. Mr. Aiyar can give you that. If I may make it clearer. If when you say gold you mean gold bullion then it will appear a small amount. If by gold for conversion into currency, you include both gold and sterling money, then you will find it is very large. The Currency Office can very well give you the figures. You have simply got to see against what the currency was issued, and to what amount. And the new currency was represented rupee for rupee by either sterling money or gold.

3700. By gold being tendered to the Currency Office?—To the Secretary of State who was supposed to act for the Currency Department.

3701. How long do you think it would take to give to the country an adequate amount of gold currency by your process?—I think that on an average we might count on at least 10 crores of fresh currency. I think it is much more but there the Currency Department again will be able to give you the correct figures. But if you look at the figures of fresh currency issued year by year, that is the measure, and if you add up the average for ten years, that will give you the total. I should say it will be something more than 100 crores by the end of the tenth year.

3702. A hundred crores the total?—Of further gold, Sir—not what we hold to-day.

3703. Didn't you tell us before that the economic development of India calls for an expansion of the currency each year by 15 crores?—Then it will be 15 crores. I do not want to give any figures without having looked at the papers.

3704. But merely to illustrate the thing?—Yes, Sir, if it is to illustrate, then I take it that about 15 crores of fresh currency would be required but that does not mean that I would issue a piece of currency against nothing. Every piece would be against gold, or every new piece of currency, whether it is a note or whether it is gold, that goes into circulation can only do so by that amount of gold being imported, and that should give you the total.

3705. What I want to know is this. You said that by the process which you have just described you expect within ten years to accumulate 100 crores of gold. But you told us before that the need for currency expansion you estimate at 15 crores. So, if I may continue and take merely 10 crores as the natural expansion per annum, then by that process you would merely have made good the natural requirements of expansion of the country. You would not have endowed the country with sufficient gold to replace the present stock?—Well, Sir, I am afraid I don't clearly understand you. If 100 crores of fresh currency is issued, 100 crores of fresh gold must go into the reserve, and if there are 50 crores now there would be 150 crores in the bank then.

3706. I don't think we are on the same subject. I want to know how much gold you would actually put into circulation?—Well, into circulation would entirely depend on the judgment of the currency authorities for the time being and I think you would not require to put more than 30 or 40 crores, for the period.

3707. You say 30 or 40 crores would be sufficient to give the country the circulating media that it requires?—Because the notes would remain there, the other media would continue to remain there. It is only the metallic currency that I am referring to.

3708. But we have to contemplate the time when the rupee coin will be *de facto* demonetised except so

far as it is required for small change?—But at least the bulk of it would be exchanged by the holders for notes so that they may not lose their rupees.

3709. But why do you suggest notes? Why is it not possible that the holder of the rupee coin would not be content to hold notes but would prefer to hold gold, a circumstance which has obviously to be taken into account?—Well, Sir, I tried to make that clear in one of my replies to the Chairman, that the bulk of the holders of the rupees would be the masses, the small men, and they would be fairly content to continue to hold their rupees because they would be in driblets—Rs. 10, or 15 or perhaps 50—excepting a few rich princes and zemindars, landholders and so on. In the transition period that I am aiming at, the bigger holders will have taken all the necessary precautions to convert their rupees into notes, because they would have no right to convert them into gold and then the Currency Department would more accurately be able to gauge its liabilities, because these big hoards having come in, the smaller could be safely accounted for and we would find that not much of that would be likely to come in; it would be required for small payments.

3710. May I say this? We have had an estimate before us that we may expect 150 crores of rupees to come in in exchange for gold if gold were in circulation, leaving a matter of 200 crores as circulating media——?—You mean 200 crores of metal rupees?

3711. 200 crores of metal rupees as circulating media; then that would be basing on an estimate of a total of 350 crores——?—That is a much bigger figure than I have been able to lay my hands on, but assuming it is, then the 150 crores that would come back, if they come back, during the transition period, can only claim to be exchanged into notes; they cannot claim gold as of right because I want to make that optional in the first 10 or 15 years of the transition period; or if they came, they would not put any strain on the resources of gold because if we do not want to pay them or if we do not find enough gold to do it with, we won't.

3712. But eventually when you do reach the stage where you will introduce a real gold standard, then you anticipate that 150 crores—if that figure is correct—will be tendered and gold will be demanded?—I do not think so. If I may be permitted to make myself clear, if Government make the encashment of notes into gold obligatory say in 1935, then the holder of the notes would not be under any anxiety to hurry up to the Currency Office and exchange it. He does not exchange into gold for fun; he would simply exchange it to-morrow if you make it at all doubtful that you are going to pay or not pay the next year. If Government simply said, "we shall give gold; we do not know how long we are going to do it but we might" then everybody including myself will rush to the Currency Office and exchange all his notes for gold, fearing that perhaps six months hence they would withdraw that ordinance. But if Government were to say, "we are going to do this, that is the law of the land, that all notes would be convertible into gold," I believe there will be no such rush. Of course when we have built up our reserves to a sufficient figure, then I do not think holders would convert; rather they would hold the notes because they would be a much more convenient form of holding.

3713. Then one point that I cannot quite appreciate is this; you say that you would withdraw the rupee circulation and lock it up pending an opportunity for sale, and at the same time you would see the country investing its surplus funds arising from its exportable surplus to endow the country with a gold currency. Both these stores of metal would be withdrawn from the reproductive wealth of the country. Why is it then that you say that there is no expense to the country? You have withdrawn and are holding locked up pending sale 200 crores of silver and you have in the meantime endowed the country with a gold currency amounting to an equal amount of money, whereas we have today 200 crores of the wealth of the country in an unproductive form, that of metal rupees, and you will, by the time you have introduced your gold currency, have not 200 crores of unproductive investment, but 400 crores of unproductive investment. How do you reconcile that with the statement that it won't cost the country anything?—First of all, I am unable to see how it is unproductive. I will put it this way. If the rupees, the metal rupees or the gold coins are held in the reserve,——

3714. May I interject? It is not a question of reserve; I am speaking of the actual coin circulating?—All right, Sir. If it is actual coin circulating, then that amount of currency is necessary for the transactions of trade, and I do not call it unproductive; it performs a very valuable function, why call it "unproductive"?

3715. Let us for the moment admit that what is needed for the circulating media of the country is productive, how do you reconcile your statement with the fact that instead of having 200 crores of circulating media, you have 400 crores of circulating media; 200 crores actually doing the work of exchange, and 200 crores locked up in your currency chests pending the sale of the silver?—When the silver rupees are demonetised, you are bound to give something in exchange for them. If Government wants to say that from to-morrow rupees are demonetised, the general public will doubtless be allowed a short period in which to change the rupee that it holds for some other form of currency, so that the 200 crores of metal rupees exchange for 200 rupees of paper or something; so the circulation will remain as it is.

3716. I am very sorry I cannot follow that, because you told us before that you do not intend that rupee coin should be tendered in exchange for gold. These were your premises. You said you would provide gold by the balance of the foreign trade of the country and the rupee coin that would come in would be locked away pending sale. When it comes, what happens? When rupees come in from the country into the currency chests, what happens?—They are exchanged for notes; they cannot come in otherwise.

3717. But at that rate you will be doubling your circulation?—No, Sir, because they would come back.

3718. What would happen to them?—They would be held in the reserves, whether you call them the paper currency reserve or some other reserve.

3719. But obviously the reserves are there as the basis for your currency?—What would happen is this. I will take a practical instance. We have today say 200 crores of total issue and a certain amount of gold securities. Well, to-morrow Government decides after giving reasonable notice, say for three or six months, that the rupee thereafter will be limited legal tender, or they might even go further and decide that there will be no rupees, that the coin will be demonetised, what would happen is that if I held 300 rupees in metal in view of that eventually that six months hence my rupees may be depreciated in value and that I can exchange them to-day for notes which I have a right to do any day I will exchange my 300 rupees for notes and hold those notes instead of those rupees so that the rupees will come out of circulation and the notes will go into circulation, the total circulation will be the same.

3720. I cannot quite see how it won't increase. You say that, from the proceeds of the country's foreign trade, you are going to stock the country with money to the tune, merely as an illustration, of 200 crores. You will be withdrawing 200 crores of rupee coin and you say. . . . ?—I am afraid we are at cross purposes. The 200 crores of new gold or new money will be coming for goods or services sent out and not in payment of rupees already in the country. That has nothing to do with the stocks of metal rupees.

3721. I will try to make myself clear. My first question was: By what process would you endow the country with a gold currency? I put it to you then,

that, as I imagined, you would withdraw your rupee circulation and you would hand out gold in exchange for it. You told me that that was not your idea?—I have explained it, I think, in my memorandum; I would not make it compulsory.

3722. Let us leave out the little niceties as to when you are going to do it. The end effect would be that you would put gold into circulation and you would be getting back, as I imagine, rupee coin, which rupee coin you would put into a chest and wait for its sale because you could not throw it upon the market. Thereupon I asked you, how you are going to finance the transaction?—If I held 500 rupees and if I went to the currency office and ask for gold, those rupees will go in and the gold will come out. Those silver notes that have gone against the gold would be cancelled as any other paper notes. Now you can cancel paper notes in the ordinary way by striking them. The silver notes would have to be cancelled by putting them into an entirely separate reserve, so that they would not any longer figure?

3723. Into a store?—Yes. Then to that extent the circulation is not changed because instead of metal rupees circulating, it would be metal sovereigns or whatever it is; the metal gold coins would be circulating and the rupees that have come in would be of the nature of notes and would be cancelled and simply they have got to be kept in a store. The cancelling of these rupee notes will not entail any financing, I do not see.

3724. I see you liken it to the cancelling of notes. The ordinary paper note has no intrinsic value; the silver note has an intrinsic value. If you replace these silver notes by gold?—Replace in what way? Everything depends on the method.

3725. Exactly, I am now taking your own point which you have just explained, that you would be handing out gold in exchange for silver notes, and by that process you would avoid an increase of the circulation?—Exactly.

3726. Now how would you pay for the gold which you are putting into circulation?—Yes, I see your point now. The gold with which we pay for the rupees would be the gold that would then be in the reserves against both kinds of note, the paper note and the silver note.

3727. It would come out of the reserve?—Naturally.

3728. Now then let us look at the reserve. While you are doing that your reserve will go down. To that extent you will have to contract your note circulation?—I agree.

3729. And unless you acquire further reserves, the point may be reached where you have no circulation at all because all your reserve will have been drained away in putting gold into circulation?—Exactly. There would then be gold in circulation. The circulation will remain the same.

3730. What I want to get at is, how are you going to provide the money to reinstate the reserve?—There will be no necessity, if there is no circulation.

3731. Then you want to replace the whole of the 189 crores?—I don't say I want to.

3732. But that would be the effect, would it not? —No, because you are assuming all the time that apart from the notes coming back for encashment into metal, there would be a further artificial exchange of the metal rupees for gold. If it is that, then I agree that there would be that additional gold to be got from somewhere. But that is not what I am saying and I never proposed that. What I say is that the rupees would remain in circulation and the bulk of them, I believe, will continue in circulation if the suggestion as I put forward is accepted, if they are allowed to remain unlimited legal tender for a long time. We can come to a point when we see that the amount in circulation is moderate and that we can take the further risk, *viz.*, to take on the obligation to convert all notes, for any purpose internal and external. Then I agree that the rupee note would come in and the gold in the reserve would go out; but the gold in the reserve is already there as a backing for both.

3733. But then you say that a point may be reached where the reserve is wholly drained and where this reserve is actually in circulation in the country?—Exactly.

3734. The country needs circulating media, again merely to illustrate, the present note issue is 189 crores and let us say, 200 crores silver, or in other words, if the whole country requires to carry on trade with 389 crores, if you withdraw from the note reserve, if you withdraw the whole of your reserve which secures your notes, you must find some other circulating medium to give you the same amount of currency in the country?—I do not understand that. I will try to put it on paper. I am afraid we are not in the same position. As I said, if I have followed you correctly, we would have, say, 200 crores of metal rupees. Then you would have 189 crores of paper notes. Is that the position?

3735. Yes; total circulation of 389?—Then we began by assuming that all the 189 crores of notes have been tendered and gold taken away? Do you mean that Sir?

3736. First of all I wanted to ask you what percentage of gold is there available to cover those notes, taking all the reserves together?—I have shown that we have 80·3 crores according to my calculation.

3737. The reserve therefore is 80·3 of gold?—Then if you add the gold standard reserve which according to my scheme will still hold 30 million pounds, that would make another 45 crores. I put it at 1s. 4d. for calculation purposes. That would give 125 crores. Now you would have 125 crores of gold and 389 crores of total note issue. That would be the position.

3738. That is to say, you would be able from the reserve to put into circulation 125 crores of gold?—Of gold, yes.

3739. Now then, the total circulation in the country to-day is 389 crores and we must suppose that the country will continue to require it. Then you would have to replace the balance by something new, won't you?—Then let us go further. We agree that we have got these 125 crores. Now you have got somebody bringing in notes and taking off gold up to the extent of 125, *i.e.*, the full extent. That is what you presume. Then we would have 125 gone and there would remain 264 crores which mainly consist of notes or silver rupees.

3740. But notes cannot exist when you take away . . . . ?—I am assuming that old gold stocks are exhausted. As we had only 125 crores of gold stocks, they go and those surplus notes, if there are any, would remain and the metal notes would remain. That is your point?

3741. No; no. Obviously you could not keep any notes when you have depleted every penny of your reserve. The balance between 189 and 125 would have to be cancelled?—I do not agree. If that was the position, then every gold standard system in the world would have to go bankrupt; because every one of them holds even a smaller proportion of gold than you are assuming here.

3742. But you would not have a penny of gold. Let me give you the figures. These 64 crores of rupees would not have an ounce of gold or of gold backing?—I agree. To take English figures, £400 millions of notes and £150 millions of gold, there are. If 150 millions were drained away, what would become of the remainder? Do you mean that will have to be cancelled?

3743. Would you really be prepared to leave the 64 crores of rupee notes in circulation with no backing whatever?—There will be some other backing which we forget. We will still have 94 crores of silver coin, which is more than England and other countries have.

3744. But do you think that is a proper cover in a gold standard country for your notes—silver rupees which avowedly you cannot sell?—I was trying to answer your other question that if your gold has been exhausted, all the remaining notes should be cancelled. I am afraid I cannot agree to it. If

that were the position then that position would come very soon in other gold standard countries.

3745. Unless you cancel them, you will have to provide further gold cover?—If the gold cover has gone, as it did go in some continental countries, the notes would remain in circulation, because something would have to be there and they would depreciate. But they would never be cancelled.

3746. It is not a very desirable thing to have?—I agree; but you began by assuming the other extreme, that 125 crores will all be exchanged and will go out.

3747. I only want to know what will be the cost to the country; how much gold will be needed and what will be the cost to the country. You told us that it won't cost the country anything and I am trying to show that it will?—My point is the rupee or every one of them, the metal rupees, whether it is worth 8 as. or something else, they are not paper. So whenever rupees have got to be converted, they would have some value; but apart from that. . . .

3748. But you cannot sell them?—Can't you sell silver? But you contemplate not selling silver because it would have an adverse effect. What I want to point out is that these silver notes need not be made obligatorily changeable for gold until we find that our position was sufficiently strong. To-day you are assuming that these rupees are to remain at these figures 15 years hence, that all the notes are going to be put in and gold taken away, then that the rupees will be taken in, and so on. I am afraid that we are taking rather an exaggerated view of things.

3749. I should like to continue the questions that I put this morning. You will remember we have taken a case, partly hypothetical, of the country having a note circulation of 189 crore and then 200 crore of rupee coin, and we came to the conclusion that if the reserves are used to put gold into circulation there would be no gold backing left when there will still be in circulation 64 crores of notes?—Yes.

3750. Now if these 64 crore notes were to be backed by gold or gold securities to the same extent as the 189 crore were backed, which you regard as desirable, there would be needed 42.5 crore, according to my calculation, of gold or gold securities, which would have to be acquired for that backing. What I submit is that those 42.5 crore would have to be provided from somewhere, and if that is so I should like to know who is to provide them and by what means are they to be provided?—Well, sir, there are several assumptions with which I am not in agreement. First of all, we have, as I tried to point out in the morning, 125 crore of gold or gold securities against a total circulation of 389 crores. The figures are the same as we took this morning. Then it shows that we begin by at least more than a 30 per cent. backing of gold. Then there is this to be remembered, that in that 389 crores you have 200 crores of rupees which—or a good many of which—have to do the same service in this country as shillings do in England. Shillings do not come to the Bank of England to be exchanged because the holders are afraid of keeping them. They are wanted as small change. Therefore the assumption that any large part of these 200 crores, or whatever remains at the end of the period, will have to be converted into gold and that gold will have to be found is one which I cannot accept. Then there is the third assumption that once the total reserves of gold are gone, the remaining notes will have to be cancelled, which is saying too much; in normal times the reserve will be absorbed in that way only if the balance of trade goes against the country; if all the reserves are gone, as you assume, then your third assumption is that the remaining notes will have to be cancelled. With that also I am not prepared to agree, because I do not think that is considered fundamental or even a rule of practice by any gold standard country about which I know. The notes will not be cancelled; they will have to remain in circulation, and the utmost that can happen is that if this extreme case does occur the remaining notes will continue uncovered, it may be, until the balance of trade of the country gets righted. But I am personally of opinion that this is rather an extreme case which need not be considered. I would not assume that shillings could go entirely out of English circulation, and in the same way that rupees could go entirely out of Indian circulation.

3751. Remember, the original question was what would be the cost of introducing gold currency in this country. May I take it that you do not agree with my contention that the introduction of a gold currency in this country will mean some cost?—If you will kindly define what you mean by "some" then possibly we might be able to see how far we agree. If "some" means 100 millions, as I believe was put by you—(*Sir Henry Strakosch*: Not by me.)——the total amount of gold required; some figure was put by you or one of these gentlemen; a big figure, then I would not agree that such a sum would be required. If the sum is much smaller, then I would first like to know why at all that cost has to be incurred. Under my scheme that cost would not come in, because if you at all feel hesitant about the amount of gold you can command in order to convert the rupees, you need not convert them. They remain in circulation, just as guilders in Holland, francs in France, dollars in America. That is not at all necessary to the gold standard which I am aiming at.

3752. You would say therefore that no cost is involved, even though you would have to lock up your 200 crores of silver coin until such time as you are able to sell?—As I pointed out, that 200 crores will be replacing other currencies as they come in; it will not be cost, it will be merely a deposit of which the counterparts will be circulating in the country as currency.

3753. It would not be a cost?—That is my opinion; yes.

3754. Now we will turn to another subject. If, on the other hand, as I personally believe, the introduction of a gold currency were to involve the country in expenditure pending the realisation of the silver held, it would be necessary to provide funds, and I take it the simplest way would be by way of loan?—As I do not see why any loan has got to be taken in order to provide any gold, I am unable to give any views on that.

3755. If you lock away 200 crores you do not see why any funds will be needed to provide gold?—If you lock them up, you will only be locking them up by giving something in exchange, it may be paper notes, it may be gold, one way or the other, and if the rupees remain locked up there is nothing for which the Government has to borrow money in order to provide finance.

3756. You talked about the commodity value of gold?—Yes, sir.

3757. And you combated the idea that the quantity of gold held for currency purposes has any influence on the prices of commodities?—Not in the way that the quantity theorists make out. If you say 1, 2, 3, or 5 per cent., I will perhaps be able to agree. If you say 95 per cent., I say "No."

3758. I have said nothing about the percentage?—Well, sir, I simply give an idea of what our difference will be. If you say the quantum of gold will be a very important factor, as Sir Reginald Mant put it, then I say "No." If you say it will have some influence, then I say "It is one of many factors that affect prices."

3759. Do you regard the rise in commodity prices from 1895 to 1914, a steady rise, entirely unconnected with the increase of the stock of gold money in the world?—I would attach very little importance to it. I would attach far greater importance to the wars which intervened. The chart will bear me out, because it will show a rise in prices just about that period. The first was the war—a petty one—between China and Japan, but it did have some influence because it immediately raised the price

of silver, it immediately raised the purchasing power of China, and in that way commodities the world over were affected; but that was a very minor affair. Then came the South African War, in which the Transvaal was ultimately acquired by the Empire. There we had a large number of men engaged on both sides and as England was one of the parties the amount of money poured out in the purchase of many commodities was far greater and you had a bigger factor at play there.

3760. You suggest that prices fell immediately after the South African War?—They did, sir.

3761. To any appreciable extent?—Fairly appreciable. The question has not been put to me and I have not been able to work up the figures, but possibly that chart might help us again.

3762. May I submit to you a chart which has been worked out for this specific purpose of examining to what extent the addition to the stock of gold money in the world has influenced commodity prices. I submit to you a chart prepared by a renowned statistician in England to check a theory advanced by Professor Cassel, whom you no doubt know, which shows that there is a very close co-relation between the increase and decrease of the stock of gold money and the general level of commodity prices. I submit that to you if you will have a look at it presently at your leisure?—I shall be glad to do that; and if you want any remarks on that point, I would just draw your attention to the fact that the normal increment from the world's mines to the supply of gold is a very small percentage of the total supply held by the world, because it is not eaten up and digested.

3763. (*Chairman.*) Before we go on with this matter perhaps we should know what we learn from this chart?—If you at all wish to cross-examine me on that you will permit me to study it. I do not want to say offhand things which I may have to revise afterwards.

3764. (*Chairman.*) Sir Henry, this is a chart showing the relation between prices of commodities and the stock of gold money in the world between the year 1850 and the present time. If you will tell us what conclusion you base on that we shall understand where the argument is proceeding.

3765. (*Sir Henry Strakosch.*) The conclusion is this, that as the stock of gold money increases the commodity prices rise; as the stock of gold money decreases commodity prices fall?—May I point out, sir, another thing; the same chart would show something else. The position may be put the other way about, that when the prices of commodities rise the amount of money in circulation has got to be increased, so that the circulation of the total supplies of money increased *pari passu* with the level of prices. It may be put the other way. If you will permit me after studying the chart I shall go into that in more detail; at present I am simply giving you the general position, and I would like to draw your attention to another very simple analogy. Take the stock of wagons and locomotives held by railways. If you study that kind of chart for the last 30 years, say, of one railway, the G.I.P., you will find that they have increased in accordance with the number of passengers, that when waggons and locomotives have increased the number of passengers has also increased. If anybody argues that the passengers increased because the wagons were there, it would be a false argument. The passengers were there. They wanted more medium of transport, and so the wagons and locomotives had to be increased. In the same way in the traffic of values the passengers are commodities and commodities valued at particular prices; if these increase then the vehicles for those values, namely, money, would have to increase *pari passu,* otherwise the thing could not be done. So I do not attach much importance to the first assumption, that it is because the first is there the second is there.

3766. May I continue? You told us that India requires an annual increase of its circulating media of about 15 crores; that is, I take it to keep pace with its own economic development?—Exactly.

3767. If that is true of India, it will be true of other countries of the world?—Quite so.

3768. You will probably remember that Professor Cassell has worked out that in order to keep pace with the economic development of the world there should be an annual increase of gold money of 3 per cent.?—He speaks of 3 per cent. for the world and 4 per cent. for America.

3769. You told us that your plan would have no influence upon the purchasing power of gold, because you would be spreading the requirements of India over a longish period, ten years?—Yes; it might have some little influence; I would not say important influence; if you say no important influence then I would be in agreement, because I want to make it clear that every little thing in this world has some influence on prices in various ways which are not easily fathomable.

3770. If India, instead of taking its requirements in one big lump, does take it gradually, would that not also be felt in the gold market of the world or rather the purchasing power of gold if the premises are correct that the world needs a 3 per cent. addition to its stock annually?—The working out of those percentages would, if they had to be analysed, take a very long time; but apart from that, the 3 per cent. which is called the foundation of credit may prove to be too big if ten years hence improvements in matters of credit instruments enabled us to work with a smaller foundation; as we have seen by experience in the last thirty years smaller and smaller supplies of gold have enabled us to build up a very big edifice of credit. So we should not merely take the 3 per cent. and say " Well, the supply of gold to-day is 4,000 million pounds; we must have 3 per cent. or 120 million pounds of gold to-morrow for the next year or credit will break down." Most probably it will be found that the thing would adjust itself if there was not that amount of gold available. Business and finance would have suited themselves by other means so that the credit edifice would remain there although on a smaller foundation of gold. England has done so in the last hundred years; since 1840, when the note issue was based absolutely on gold, they gradually developed the cheque, and now everybody admits that the cheque currency is the most important currency in England and in the more civilised countries of the world. So we should not, I think, take it as an axiom that it should be 3 or 4 per cent. If you simply take it as an axiom that the development of the world or of the various countries of the world individually will require larger and larger amounts to finance them and then if you further postulate that under a gold standard that might mean a larger amount of gold as the foundation, then with that general proposition I would be in agreement; but if you say it should be 100 millions, or 50 millions or 200 millions, then I would say we really do not know what developments are going to be.

3771. May I interject? I was not arguing that point at all?—No? I simply say then that I was answering your question about 3 or 4 per cent.

3772. I do not lay any particular stress on that?—If you will kindly explain to me what exactly you want I shall give you an answer.

3773. I must say I am very glad you mentioned this because I was coming to the very point you have just made, namely, that devices will be found to remedy any deficiency that may exist and in that connection I wanted to ask you whether you have followed the proceedings at the Genoa Conference?—I cannot say I have studied them; but I have in a way as part of my general reading of these questions read what transpired there.

3774. And, if you have done so, you will have generally appreciated that the main purpose of the financial resolutions passed by the Genoa Conference was to do exactly what you have just mentioned,

viz., to provide for the future a system which will enable the world to carry on without material curtailment of its credit structure, no doubt because of the fear that the stock of gold money may not rise in the same proportion as the economic development of the world?—Quite so.

3775. Very well then. What did the Genoa resolutions advocate in order to carry into effect that idea?—If I remember aright, because I have not looked at it recently, the main proposition was that the reserves of the world should be as far as possible kept in one or two or three centres. It would be ideal if you could have one centre for the world, but if that was not possible, let it be two or three; and then every country in the world would be working its credit edifice on the foundation of those reserves. I would first like to know if I am right in saying that that was the principal recommendation.

3776. That is a part of it. The fundamental proposal made and agreed to was a plan by which countries would adopt a gold exchange standard and that certain centres in the world should be selected as gold centres which would liquidate by the shipment of gold the balance of payments?—That is exactly what I meant.*

3777. Therefore they were out to economise the use of gold because there was the fear that the credit structure might not be supported by an adequate base of gold. Then in addition to that of course, they recommended a co-ordination of credit policy so as to keep the purchasing power of gold as stable as possible?—That again will lead us, I am afraid, into argument because the purchasing power of gold theory requires very close analysis.

3778. The Conference was an international confence. A great many authorities of the first order came together and passed that resolution. We cannot, therefore, ignore. . . . ?—No, I do not want to ignore. . . . . their warning and we must, I take it, carefully study their recommendations when we study the currency system of any country, including India?—I agree.

3779. And therefore it becomes so very important to know and perhaps you may give us the benefit of your consideration on the subject, what amount of gold will be needed to equip India with a gold standard such as you envisage?—I have tried to do it in the morning in reply to one of your questions that if we adopt the scheme that I have put forward forward from to-morrow then in the next ten years we shall have got together in the reserve 100 crores of gold if not more. I take that to be the minimum; and if your question means that India has got to get gold in some way in order to develop, then I may be found to be in disagreement because I do not believe in India going and getting 50 crores or a 100 crores or any amount of gold whatever and then starting development with it. What will happen is that India will have to work hard and get the gold in return for the goods and services that India provides to the world. If she does not do that, if she has no surplus goods or services she will not get the gold; if she does, she will get the gold. India will get all the gold that she not only requires but that she deserves by her work. If India does not deserve it, then even if India requires it she cannot get it; why should anybody give it when there is no need.

3780. I refer to paragraph 7 of your conclusions in which you say "gold should be freely issued to all who tender local currency and ask for gold, but it should be issued only for *bona fide* export purposes." Then in the subsequent paragraph you say "Encashment of notes for internal purposes to be in gold, or silver rupees, or both at the option of the Issuing authority." I wanted to ask you what you think the psychological effect of these two conditions will be. Would it not lead to the public, knowing that at a given stage notes will not be absolutely exchangable for gold putting aside or hoarding the first issue of gold money which is put into circulation?—My answer to that would be that in 1898-99 when the Fowler Committee was studying the question there were apprehensions of the same kind; but the experience since then up to 1915 showed that although the Government did not give gold or sterling except for foreign payments and even then only in London and not in Bombay, still nobody was panic-struck; nobody went to get gold while he could get it, and things worked very smoothly. So if past experience is any guide, then, I think that in the next ten years the experience will be similar, that is, if Government simply gives gold or gold equivalents for foreign payments, and does not give it out freely for internal payments, it would not make any difference so far as the holders of rupees and notes are concerned. They will be unconcerned. That is my conclusion from past experience.

3781. You do not think that gold put into circulation will go into hoards?—There again we shall have to differentiate between the hoards as put in by a miser and as stores of value. If by hoards you mean stores of value which are brought out once, in two, three or four years when you want to make use of them, in that sense that gold will go into the stores of value of those people who have got sufficient money to put by because under the scheme one unit will be Rs. 15 or Rs. 13—it will be a fairly big unit for the great mass of the people. The remainder of that would be hoarding if you please of other things, that is, holding similar currency which would be rupees or notes. So I am not afraid of any large amount of gold money being hoarded in that way. Gold as bullion or as ornament is of course quite different.

3782. Now I come to quite a different subject. In paragraph 11 you lay down the reserves which should be held against the note issue. I do not see amongst the supplementary cover of the note issue any reference to commercial bills?—I have purposely kept that outside the ordinary note issue. I shall explain why. I know the practice in Germany of issuing extra notes against a certain tax; I know the practice in the United States; but comparing it with the practice with which we started here in this country of having an emergency issue which is entirely outside the ordinary note issue, I have come to the conclusion that that is perhaps the better way of doing it, and that is why it does not figure in the ordinary issue. Supposing we had 200 crores of note issue, even if 10 crores of emergency currency is needed to be issued, it would stand outside the 200 crores, it would have no reference to the gold or the other notes. It would be backed absolutely by the commercial bills against which it has been issued and will be automatically liquidated by those bills when they fall due. I think that is a better and a sounder way than putting it in as part of the total issue because then you have got to see, the percentage may vary, the gold may be so many per cent. more, the silver may be so much less. And it will introduce certain unnecessary confusion. The other is a far simpler way to my mind.

3783. Would you say it is true that most central banks base their note issue on gold and on self-liquidating bills because of the fact that the self-liquidating bills which are bills against goods in the last stages of production or going to market are the best security because they correspond to the need for expansion and contraction in the currency of a country?—Yes, Sir, that is true. Many central banks do that. I don't think the Bank of England does anything of the sort, but many central banks do that. But that is no reason why we should in this country slavishly imitate what has been done elsewhere if we find the other system is better. It is of course for your Commission to consider whether the system which is now in vogue with suitable regulations is the better way of doing it or of adopting the trade bills part of the issue as part of the total issue, because then I am afraid the percentage question will create difficulties.

* See also Appendix 18.

3784. But don't you think that any system should be as automatic in its operation as possible?—But, Sir, this will be automatic.

3785. Well, I am not quite sure that it will be. Your expansion occurs through the balance of external trade. Your expansion and contraction is the result of the state of your foreign trade?—I don't agree, Sir.

3786. It has no automatic device to contract and expand so far as the internal needs of the country are concerned?—Well, Sir, I have tried, if I may say so, I have tried to make the two very clear. The expansion of the note issue, or I won't say simply the note issue because it really means the expansion of the amount of the currency available to the country, does occur directly as a result of foreign trade. I agree. And then you say that for internal trade purposes there is no automatic expansion. Is that the point?

3787. That is the point?—Well, for what internal and trade purposes? In normal times I don't think any such expansion is needed, because as I have tried to explain, the bulk of the movement of goods to the ports is for the exports and it gets financed automatically through import of gold or gold securities against which currency is issued. So that question will not arise excepting in a year when trade depression is very severe and the countries outside India do not want India's goods and stocks accumulate in the ports and in the interior big markets. Then it is possible that a further supply of currency may be needed and we might then, if we have a proper discounting arrangement in this country, which unfortunately we have not, find that the surplus of finance will automatically gravitate to the final discounting agency, the Imperial Bank, which bills they will tender and take out currency on from the Currency Department and if later they don't want that extra money, they will repay those bills and the currency will automatically contract. So that I think, Sir, if the present system worked properly, which I don't think it does, the bills to-day are not correct trade bills,—if they were, then I think the thing would work automatically.

3788. But Mr. Madon, is it not a fact that a discount market can only develop when you have a central bank which is prepared to rediscount all true commercial bills at any time and in all circumstances?—I agree, Sir.

3789. Very well, then. If you rob the note issue of the backing of commercial bills, how is the central bank to manage its affairs, to give to the country the discounting and rediscounting facilities when they are most needed?—I will try and explain. I don't know whether my answer will be complete to you. But I will simply take an instance, that the Imperial Bank becomes the central bank of the country with all the reserves entrusted to it. Then I also assume that the Imperial Bank on the recommendation of this Commission undertakes to rediscount. Then what will happen is this, Sir. The Imperial Bank will go on rediscounting bills offered to it and in times of stress those bills are bound to come to it. If the stress is not there, it proves that there is no additional currency required. And when the Imperial Bank finds that its advances for rediscounting are up to the full extent of its reserve, it may take some of those bills to the Currency or Issue Department and say: we want this to be discounted, and the Currency Department would then rediscount the bills up to the extent of whatever figure the Commission would recommend and that would be automatic expansion. And whenever any of those bills fall in at maturity, it would be automatic contraction. The present practice is different, but I would like the Commission to look into it and to suggest recommendations from their experience of it.

3790. You would consider it a desirable arrangement that the Currency Department should rediscount bills of the Imperial Bank? How is the Currency Department to know what are good and what are bad bills?—If they are presented by the Imperial Bank with its own endorsement and if the bills have come in the right way with the endorsement of the local banks—sometimes there are one or two parties—private local merchants—then one of the banks has rediscounted. It may be that two or three banks have discounted. Bank A has discounted but as a matter of fact wants money. Bank B is prepared to discount at ½ per cent. cheaper. Then if Banks A, B and C are unable to take any more, then with their endorsement they would take the bill to the Imperial Bank. If it has the reserve, it will rediscount them. If the Imperial Bank finds it cannot do it, then it will have to send to the Issue Department with its own endorsement and get money from them. So, Sir, the question whether the bills were sound would be automatically solved. They would bear on their faces a certificate that they were sound because there would be so many people between the Currency Department and the ultimate drawer of it.

3791. And you would therefore leave it to the judgment of the Currency Department whether or not the emergency has arisen?—I would not put it in that way, Sir.

3792. But if the Currency Department is to rediscount, obviously it is within their discretion to refuse the Imperial Bank to rediscount?—I would say, Sir, that what would happen is that, if the Imperial Bank has got to go to the Currency Department and say: We want to discount 5 crores, it is a proof of the emergency, because the Imperial Bank would not go there unless its own funds were fully invested and more funds were wanted. So what the Currency Department would have to do is solely to carry out its duty under the statute, that is to give further currency against such bills at the particular rate that may have been laid down by statute.

3793. You would make it a statutory obligation of the Currency Department to give currency against bills that are classed emergency bills at the sole judgment of the Imperial Bank?—I don't say classed "emergency bills" at all. Because then the discount market would not be right. You would be merely helping people when they were in distress. That is no solution. It may be that the trade of the country is quite good. People may be doing good business and still they may require a larger amount of currency than ordinarily. So I would not say that the Currency Department should start by asking whether they are emergency bills or things of that sort. It has simply got to say—when the Imperial Bank or the Central Bank of the country comes to it and says "We want to rediscount with you so many crores"—it has got to say that it has already had so many bills, the limit is so much, and that it is debarred by statute from doing more. I believe that is the present position. Sir Norcot Warren may make it clearer. I don't think the Currency Department picks and chooses between bills you take to them and say: Are these emergency or not?

3794. No, I am asking you whether that is a desirable organisation because I understood from your memorandum that you think a currency system which is self-contained and under the charge of a real central bank is the ideal to be aimed at?—I agree. But there the Issue Department, I have made it very clear, should be independently maintained. It should not be part of the general banking business of that central bank. I don't call it ideal. I would rather carry out the thing on the model of the Bank of England.

3795. May I go a step further? You said that the most desirable bills to be discounted by the Central Bank are self-liquidating bills representing goods going to market?—Yes, Sir.

3796. And you would regard a bill drawn against commodities which are held up, whether because of general circumstances or for speculative purposes, as unsound bills, wouldn't you?—Well, Sir, if you begin by assuming that they are held up, then the thing would have to be further analysed. **Held up for**

speculative purposes, that is because the holder thinks the market is going to rise very high or held up because there is no market. The bulk of the bills would be, in times like those that I am anticipating, times of trade depression, they would be bills against goods that are held up not for speculative purposes but because temporarily the outlet is stopped.

3797. Could you distinguish between bills drawn but held up for speculative purposes and those whose purposes were good? Could you really distinguish between the two?—No, Sir. I don't think I could.

3798. Very well, then, how is one to judge whether these are really good bills in an emergency? Wouldn't you prefer to say that all bills should be self-liquidating for a short period only?—For a short period undoubtedly. That I agree with. I never meant that any such bills should be over six months or a year. I am not sure, but I think I have mentioned that they should not exceed——

3799. In your paragraph 22 you suggest that an emergency issue would only be needed for financing Indian produce when for some reason the foreign demand for it was poor and the produce had to be carried for a considerable time. They are bills drawn for a considerable time?—No, Sir. If you will kindly turn to the heading "What kinds of Bills should be made eligible" (Appendices, page 165), you will see what kind of Bills I have aimed at. I have made it very clear.

3800. I was not sure whether that also referred to the emergency bills?—I only meant that. At the top, I speak of the emergency currency required, and the last paragraph says what kind of bills. I mean them to be for emergency.

3801. Then of course they could not carry for a considerable time the produce which was not sold?—What would happen is that some of the produce would be sold all the time. Some holders would be selling at a low price; some might hold; but if the Bills are 60 or 90 days' bills, then by the time that bill falls due, whoever the drawer of the Bill is will have to see that it is realized and get money, and the indorser will have to see also. So they will be self-liquidating, and I do not think the fear you seem to have in your mind that some of these bills might be used merely to hold up goods for a very long time would be realized.

3802. Then there is one other question. I think you contemplate under your scheme that the Imperial Bank should hold what is now termed the gold standard reserve, that is to say a reserve to secure the exchange value of the rupee, which would be held by the Bank and managed by the Bank under rules to be laid down by statute?—If you will kindly explain to me what you mean by "managed."

3803. Well, I am asking that question in connection with your clause 16 where you make it impossible for the Imperial Bank to deal on its own account in foreign exchange?—How will that affect the question?

3804. I will tell you. You contemplate a reserve held only in gold?—You mean the gold standard reserve? The paper currency reserve I contemplate entirely in gold for the future. I have made it perfectly clear that a part of the gold standard reserve which will remain after my scheme has been adopted would be invested in securities and would be allowed to accumulate by interest earnings year by year.

3805. And finally you propose to turn it into gold?—Finally, that is when you make up your mind to give gold freely and make it an obligation of the Currency Department.

3806. Well then you will have to acquire gold. Now it is conceivable that gold may be cheaper in one country than in another. You may be able for instance to buy gold cheaper at Durban than you can buy gold in London. How would you propose to settle that purchase of gold in Durban if the Imperial Bank is not permitted to deal in foreign exchange?—What the Imperial Bank will have to do is to go into the gold market, say in England, and offer its sterling holdings, say one million, and say, "we want gold." Then some of the South African banks would be selling the gold to them and taking their sterling from them. That would solve the question. The Imperial Bank however should not dabble in exchange. It ought simply to buy the gold at the best possible rate in London; the gold and silver markets are so sensitive that the gold quotation will be the lowest that is feasible in any part of the world.

3807. To give an illustration, you can buy gold in Durban to-day at something like two pence an ounce cheaper delivered in India than you can in London?—I am afraid you have misunderstood it. You buy it in London: that does not mean that you take delivery in London. Some exchange Bank will say, "all right, we will deliver gold to you in Bombay"; they might bring it from Durban or Melbourne or San Francisco, but what I want to make clear is that some bank in London will be coming to the Imperial Bank and give the best possible quotation for gold from some point in the world where it holds it. The Imperial Bank need not dabble in exchange and go into the exchange market.

3808. You will admit that in these circumstances the Imperial Bank is confined to buying gold in London only even though there may be a substantial difference between the London price of gold and the price of gold in any other centre?—If you would put it that way then I would very much prefer that the Imperial Bank should buy from Bombay and ask sellers to tender for delivery in Bombay or Calcutta and allow them to come forward, and competition will give you the cheapest price from the nearest point where gold could be laid down cheapest.

3809. You agree however that if you debar the Imperial Bank from any foreign exchange dealing, then if they were not allowed to go to gold standard countries and hold their currencies, the only way of settling the foreign balances would be by way of shipment of gold?—Exactly.

3810. And that that is a rather expensive procedure?—I do not agree. The expense would be for the other parties. The Imperial Bank has got the gold. By the Imperial Bank I mean the currency authorities of the future. They would have the gold in Bombay. Somebody applies for it, the Imperial Bank pays it out and there the expense and cost is over. It is the party taking it to say Japan which meets the cost. To Port Said or to Egypt it may cost him very much less. That has nothing to do with the Imperial Bank.

3811. You will admit that if they were allowed to hold foreign gold currencies, the loss of shipping gold would not arise?—I do not agree that there is any loss. If you say that the profit they might otherwise have made would be less, then we might agree.

3812. Let us not split hairs?—Then my point is that if that profit is a desirable thing, why does not England do it? Why does England import gold? If they are so foolish, then I would simply say that India would be in the same foolish company also. The manipulating of currencies is in my opinion likely to lead to very serious abuses.

3813. There are only two more points. In clause 18 you prohibit the Government of India or rather the Secretary of State remitting home more than what is needed for the current financial year. In clause 20, however you say that in case there should be an undue demand for sterling, you would recommend that the Secretary of State, instead of buying sterling, should borrow in London?—I am afraid we are again at cross purposes. I do not speak of any undue demand for sterling by the Secretary of State. I speak of the trade balances. What I say is that if the trade balance is adverse, and India has to pay out gold on account of its balance of trade in order to make the settlement, then at that moment the Secretary of State should not press India to simultaneously pay him his own dues but should

temporarily tide over it by financing himself in some other way, and I would point out that that is what England's practice is to-day as regards America.

3814. But why debar them from the reverse process? If for instance there is an exceptional supply of sterling through an exceptionally fine harvest, would it not be well to assist in maintaining the purchasing power of the rupee stable by the Secretary of State remitting not merely the year's requirements but something more?—I am afraid we cannot go into the ticklish question of the purchasing power of the rupee. If you put the question in a general way whether the Secretary of State should draw more or not, I would say that he should not unnecessarily withdraw from India a single rupee that he does not require for India's ordinary liabilities. No agent would be allowed to do that, and the Secretary of State, as far as these payments are concerned, acts as the agent of India. India has to get a stock of goods and to get certain services and she has got to pay for it; the Secretary of State acts in London as the agent of India only to carry out those obligations. Why take away more money? I think it is wrong in principle.

3815. It only struck me that it is rather an unbalanced arrangement. In the one case you ask him to give advantages away, to borrow in order to pay for, at a high rate of interest, and in the other case you debar him from doing the reverse transaction for the self-same object namely to maintain as far as possible the purchasing power of the rupee?—That is where we are in disagreement. That object is not an object for which he should act in that way. I do not think he is right in manipulating the currency for the purpose of maintaining the purchasing power of the rupee.

3816. (*Sir Maneckji Dadabhoy.*) The Chairman has very exhaustively examined you on most of your memorandum as well as in connection with your verbal evidence and many interesting points have been elucidated. I now wish to make certain points perfectly clear. I would just like to get a few points cleared in order to appreciate exactly your position, and I would like you to tell me if I am correct in my conclusions with regard to the principal points of your evidence. I gather as a result of your discussion that you do not find fault with the currency policy of the Government since 1894? You are of opinion that on the whole it has worked satisfactorily but that in certain respects it has been not managed correctly by the Secretary of State and the Currency Department and the Government of India?—If you will say from the year 1900, then I would say that your question was substantially correct.

3817. You think that my conclusion would be substantially correct and that during the period 1894 to 1900 it was on the whole satisfactory?—No, it was not entirely satisfactory. I have not gone into detail because that is old history and it is not profitable. Everybody knows about it.

3818. Then I gather from your evidence that despite the circumstances it will be wholly unprofitable to reconstruct or to re-establish the pre-war gold standard exchange? Am I right in drawing that conclusion?—I have made it very clear that in view of what had happened, the gold exchange standard is not a system which should continue.

3819. And therefore it will not be profitable to reconstruct that pre-war standard?—I would not support it in any shape or form.

3820. Then I also gather from your memorandum that if we were dealing with a gold exchange standard, practically, we have in fact rooted a gold standard? You agree in that view?—What did you say? I could not hear it.

3821. That we had practically made a beginning of a gold standard? Am I to understand that though we are nominally following a gold exchange standard since 1900, latterly we have been making headway or gradually taking steps towards the gradual establishment of a gold standard?—Well, Sir, If you want an answer to that, my answer would be this: Up to the year 1899, from 1893 onwards, apart from the individual steps about which I said I am not satisfied, the goal always was a gold standard with a gold mint and a gold currency and that is made very clear from the letter of Lord George Hamilton, the Secretary of State at the time, to the Government of India. I think I have got it somewhere. I will try to give the actual words used in that letter of Lord George Hamilton. "I told your predecessor that it had been decided to refer to the committee, the proposals of your Government with a view to the completion of the policy initiated in 1893 when as a first step towards the establishment of a gold standard, the mints were closed." This is a very brief sentence. I have tried to summarise it from more than one sentence, probably ten sentences. But the words are those, word for word, which were actually used. I will quote another sentence. "The Committee indicate their conclusion that steps should be taken to proceed with measures for the effective establishment of a gold standard and recommend that the Indian mints should be thrown open to the unrestricted coinage of gold." Then, Sir, in another paragraph in the same letter he says: "I have, therefore, decided that you will make preparations for the coinage of gold under the conditions suggested by the Committee." Now, Sir, up to that point, that is in July, 1899, it is perfectly clear that the authorities, both the Government of India and the Secretary of State, had a gold standard with a gold currency in view and what is more, Sir, a year or two later, Sir Clinton Dawkins in the Viceroy's Council did say, I have not got the quotation here, but I perfectly remember it, he did say that arrangements had been made for a gold mint, that officers were on their way to Bombay to see that the mint arrangements were satisfactory and that the thing would be started very early, and then God only knows what happened. So if you ask me whether we began like that, then I would agree with you. But if you say that we went to it step by step, then unfortunately my reply would be that we step by step went backwards instead of forwards.

3822. That is, it came in at a later stage, at the time of the Chamberlain Commission?—What came, Sir?

3823. Receding step by step?—No, Sir. It was throughout so. That is, the gold mint was not open, gold was not allowed to be coined here. Then gradually the law provided that against gold tendered in India rupee currency should be issued. The Secretary of State took measures to give a little cheaper rate to people who tendered the gold in London instead of in Bombay and in that way he diverted shipments of gold, so much so that shipments from Australia passed by the gate of Bombay to London instead of being landed here; and then later on, in 1907-08, they went further and took it that the gold standard reserve was a superfluity and might very well be invested in something else and some of it was used for railways.

3824. (*Chairman.*) I think this historical analysis is very fully set out in the memorandum of Mr. Madon, and I am afraid we are rather imposing upon his time by asking him to recite the particulars in this way?—What I want to make clear is that we were gradually retrograding instead of gradually progressing.

3825. (*Sir Maneckji Dadabhoy.*) I understand that you make three substantial complaints, and if I am right in understanding you, that the use of currency notes in internal circulation was not properly encouraged?—I am afraid I have not said that. Which part do you refer to?

3826. In connection with the gold exchange standard?—The question of a small note and the encouragement of currency note instead of gold had been considered not in the pre-war days but in 1916-18; but then both metals, gold and silver, were very scarce.

3827. Regarding this gold standard reserve, I understand that in your opinion there will be no serious drain on the resources of the country; because we shall not require at the outset more than 30 or 40 crores worth of gold?—If my scheme were adopted?

3828. Yes?—Yes, that is my opinion.

3829. When giving your opinion you have taken certain figures. You have said that 200 crores will be the metal rupees and 189 crores notes, and you have made a provision of 125 crores of gold to be put in circulation, and if you take 125 crores from 389, there remain 264 crores. Will you make it perfectly clear what resources you will find to convert this 264 crores into gold?—Well, Sir, that leads to the theory of the percentages of gold to be held in the reserve. 125 crores of gold and quasi gold by which I mean securities amounts to some 32 per cent. and the total of 389 crores is, only to take the case of England for comparison, not only pound notes, but shillings and pence, the small currency, is there in those 200 crores. So what I would like to make clear is that according to the present accepted practice 32 per cent. will not be by any means a backing to be despised, and if the scheme is carried on as I suggest for the next 10, 12 years, then automatically the backing will improve, because while one crore of gold will come in against one crore of currency, the percentage will constantly increase. It is Sir Henry Strakosch that wanted me to say what would happen in the case of the remaining 264 crores, and you want me to say the same thing. My reply would be that the present currency experience would show that in normal times, that is, when trade is ordinary and there is no panic, this 32 per cent. with which we start will be adequate, and will be even much more than adequate in the next ten years, because it might be 42 or 52 per cent. Then I have tried to emphasise that part of it is really shilling currency, and that shilling currency will continue to be required for small changes. So I do not think that the 264 crores require any apprehensions on our part.

3830. But then during this transition period, if one or two severe visitations, say of famine, take place, will not all that gold disappear?—If the visitation is again a big war, this gold is likely to disappear, because then people will try to change everything into gold and hide away that gold as a store of value. But apart from a big war, if it is merely a trade crisis, then the holders of the rupees will be already in a very tight position and would not be able to meet their own current engagements, and would not be in a position to think of converting some of these rupees into gold and hide away; that would not occur.

3831. Then your position, as I understood you, was this: that it was not necessary for India to buy gold to start its operations; but it should gradually earn that by adjusting exchange on commodities and gradually build up her gold?—That is my idea.

3832. During the transition period and before actually going for a fuller gold standard?—Well, Sir, I will again have to call attention to the definition of the word " fuller." To-day England is not giving gold for internal circulation, and many other countries are not, and still that is not considered to be any serious derogation of the gold standard. So if India does not do that for the next 20 years, I do not think it will be considered any derogation. So we need not talk of a fuller gold standard. But if you say " before we can consider giving gold out into circulation," then I would say certainly we might do it after an interval.

3833. Assuming that we have to find this gold, I would like to put to you one or two queries and like to have your considered opinion. Assuming that we have to obtain, say, 100 or 150 crores of gold for this purpose, for converting the note issue into gold coin or other bullion, you know that there is a large amount of silver in the hands of Government which will be of little use once we introduce the gold standard and could we not sell that silver and acquire gold instead?—And what would be the economic effect of it? The Government holds to-day about 90 crores of silver in the paper currency reserve. If that is what you mean, and then there are metal rupees in circulation, and if no more rupees are to be coined from to-morrow, then apart from the absorption of which I spoke in one of my replies to Sir Henry Strakosch, we have got to consider the larger needs of the future population of this country for small change, *i.e.*, shilling currency. I do not mean merely annas and pice, but bigger subsidiary coin, the rupee, and it may even happen that 10 or 15 years hence, you might find you want all these shillings in India in circulation, and that there was no need to go and sell them. I would postpone settlement of that question until we know the situation better.

3834. Are you in favour of Government's selling its sterling securities to acquire more gold?—Which securities, you mean in the paper currency reserve?

3835. Yes, in the paper currency reserve?—There is this to it. Sterling securities are in England. They are English securities. So there would be two considerations. First of all, you might to a certain extent, if you wanted to liquidate them rapidly, disturb the London financial market. Then, secondly, after you havo realised securities and got your pounds at credit in the Bank of England, if you wanted to have them in gold, you might have to disturb the reserve of the Bank of England, which again would react on the whole currency fabric in that country, and, as that country to-day finances the world, it might affect a great many other people besides England itself.

3836. It will not be a sound policy?—I would therefore say, Sir, that although India would be entitled to say that it wants to sell off its paper, that it wants to take away the cash to its own country, practical considerations should make us do it in such a way as not to disturb the economic position of the world around us.

3837. That is, you suggest that in any settlement we should not look to the primary interests of this country, but also look to the economic disturbances in other countries. Might I gather that from your reply?—Well, Sir, the position is this, that the sterling securities were held before we had to consider this kind of question. They are there. If we had not accumulated sterling securities and only acquired gold, then I am quite sure that it would not have been felt by the Bank of England or by any other gold country because it would have come in driblets according to India's credits and over a space of years. Now that we are in that position, we cannot ignore the consequences of that position, and we cannot say " Well, I will look after myself; I do not care for the world." If you will permit me to repeat a Hindustani proverb, "*Sub subki sambhaliyo men meri fodta hun.*" To translate it, " Let each one look after himself; I am looking after myself." So I do not think that would be a practical solution of it.

3838. It would not be a reasonable solution? Let me give you one fact. When the Western countries demonetised silver, did they look to India's interests, how it would affect the silver market in our country? —Unfortunately, no. But if we find doing something equally foolish disturbs our trade, we have got to consider when we wish to do the same thing. It is no good saying " They hit us 20 years ago; let us hit them back now." While we are trying to do that, it may recoil on us like a boomerang.

3839. Of course, there is no doubt about that?—In one of the questions, I think by Sir Reginald Mant, it was advanced that since 1873 the larger demand of gold which Germany's going over to silver had created had led to the depression of that period and not merely the peace that I argued was the main cause. But there is no doubt that part of that depression was undoubtedly due to the fact that silver was thrown over and gold was adopted as currency by France and Germany and many other countries of Europe. So if that is any lesson to us, then

we have to walk more warily to-day, and not to say "We do not care a hang for the world; this is India's gold; we want it and shall take it." We should certainly do it more carefully.

3840. What do you think of the appropriation or the utilisation of the interest on sterling securities for the purpose of building up our gold standard?—Well, Sir, there are two parts of it: we have the interest earned in the paper currency reserve, and then there is the interest earned in the gold standard reserve. Under my scheme the gold standard reserve will be reduced by 10 millions, but that will go into the paper currency reserve. So the total under interest earnings will continue, but I wish to allocate them differently. I have suggested that the earnings in the paper currency reserve may go to the credit of revenue as they are doing now, and the earnings in the gold standard reserve may accumulate in that reserve. That will mean a little sacrifice, but I think we might safely face that, so that that reserve might be more rapidly built up.

3841. I will ask you only one more question as I understand my colleagues have to ask you some questions. In your opinion, what period of moratorium will be required for enabling the public to convert silver currency? We shall have to fix some time; before making the rupee limited legal tender, we shall have to give some period to the public to convert their money, and I ask you in your opinion what period of moratorium will be required?—I think, Sir, that question again hinges on the experience that we might acquire in the transition period of the first 10 or 15 years. If it is found that the amount of rupees left is not very large, then with our considerably higher limit for the legal tender than the shilling has in England, we might safely do without any moratorium, because if the limit is, say, Rs. 500 or Rs. 1,000, then I for one am of opinion that a very large amount of rupees held will be by individuals whose separate holdings will not amount to that figure, so that most of them should feel satisfied that the rupee was quite as good to them for expenditure purposes, for buying the things they need. So I do not think a moratorium will be necessary; but that problem might be reconsidered when we are at the end of the transition period.

3842. (*Chairman.*) We must not trespass unduly on Mr. Madon's time?—I am at your service; we do not have this sort of Commission every day.

3843. And we do not have the advantage of your presence every day; but as there is the important question of the ratio to be raised, perhaps we might deal with that now and if there are any more questions on the first heading we might return to those later. Let us now turn to the second heading of the Ratio. I understand, in your opinion, in the first place, as you vigorously express it, that as regards the solution of the problem we are discussing, for the last two years India has been even more ready for the gold standard than any other country; and that implies also, in your opinion, that the time is ripe for the fixation of the ratio of the rupee?—I would merely modify that by saying that if my answer implies the gold exchange standard, I am not for it.

3844. I do not think there is any implication of the sort?—The only thing we should have to do is to select our new gold coin and if it is to be the sovereign then you have to see how many rupees would circulate as equal to the sovereign. To that extent I think we have to consider it.

3845. Just to direct your mind to the considerable volume of evidence we have received, you do not foresee any disturbing effect in the general monetary position of the world such as would make it prudent to wait for another period before taking any action as regards Indian currency?—I do not think so, because with all the other important countries of the world coming back to gold I do not see any advantage in India holding out.

3846. You express a very strong opinion, which you support with considered arguments, that, to follow your own wording, the ratio of rupees to the gold coin should be 15?—Yes, sir, because it is the pre-war ratio.

3847. That is usually referred to as the 1s. 4d. rupee?—Yes, sir.

3848. I just want to test your view, if I may, and you will understand that, if my questions are directed to testing your arguments, it does not imply the adoption of any particular point of view on the part of the questioner. I understand you not only admit but affirm that any change up or down from a given rate must cause inconvenience and loss to a section of the community. In that given rate would you include such a rate as the rate at present current, the 1s. 6d. rate?—What I had in mind was the controversy whether now that we are on 1s. 6d. we could go back to 1s. 4d., and I have tried to answer that argument.

3849. Yes, but it is a perfectly clear statement by itself that a change up or down from a given rate causes a certain amount of inconvenience and loss to a section of the community?—That is perfectly correct.

3850. Then you continue: "But such considerations should not be allowed to stand in the way of doing the right thing." I am trying to get precisely at your opinion on this point: What is the rightness involved here apart from the question of convenience? Can it be right or wrong to do something in connexion with currency which is not convenient, convenience being, of course, convenience to the general public?—If you will permit me to make my point clear, the coin on which we have based all our transactions, really means if we are on a gold standard how many grains of gold I owe to another man or that man owes to me; and if I had borrowed, say, a thousand rupees from a man 10 years ago, it would have amounted to my having borrowed 7,500 grains of gold and my liability would be to return 7,500 grains of gold and it would be finished. If you change that to 8,500 as to-day's rate would make it change, you are increasing my liability and are vitiating my contract and inflicting an undeserved hardship on me as a debtor.

3851. That analysis refers to contracts which were entered into at the time at which the rupee was on the 1s. 4d. basis?—Yes, sir, I mean that.

3852. I am sure you would be prepared, in maintaining that case, to have this point adduced for your consideration, that if, on the one hand, the 1s. 6d. rate upsets the contracts entered into when the rate was at 1s. 4d., so, on the other hand, a return to 1s. 4d. would upset contracts entered into when the rate was 1s. 6d.?—Put that way it is correct; but then you have got to consider the volume of contracts and the period of the contracts.

3853. That is just the question I wanted to ask you. Let me phrase it in this way: What is your reason for supposing that the bulk of interest concerned in contracts entered into when the rupee was at 1s. 4d. is a greater volume of interest than contracts entered into when the rupee was at 1s. 6d.?—Yes, sir, that is very simple to answer, because up to I may say the beginning of 1919 the real rate was 1s. 4d. gold, although the market rate was 1s. 5d. or 1s. 6d., because the New York cross rate had been at 4·76, which meant that sterling was about 2 per cent. less than the gold value. Even at 1s. 5d. we were on a gold basis much nearer 1s. 4d. That continued up to the beginning of 1919 from about 1898; that means that for 21 years we had certain contracts based year by year on the basis of a coin which was 7.53 grains of gold and not more. Then we come to a more surprising part of it. About the middle of 1919 we had this Committee, and in the meantime the rates were put up by 2d. at a time; but when you come to the middle of 1920 again we notice the curious fact that exchange was once more very near 1s. 4d. gold and on the very date that these two famous Bills were passed, the Coinage and the Paper Currency Amendment Acts, calling the rupee 2s. gold, the actual rate of exchange converted at the New York cross rate was 1s. 4d., and thereafter it has never been more than

1s. 4d. until you come to October, 1924; so, twenty-one years before 1919, then one year of abnormal times, and then again five years up to 1924 we had all contracts and all transactions based on 1s. 4d. gold as the unit, and the 1s. 6d. gold has been in existence only since I may say March or even April, 1925, when England went to the Gold Standard, because until then even the 1s. 6d. was sterling, not gold. If you wish it, sir, I have got the figures here worked out in gold——

3854. We have those figures?—Then you will find that I am correct in making this statement.

3855. What are the particular classes of contracts which you have in mind that have run for a long period, for a period so long as to date back to the time when the rupee was stable at 1s. 4d.?—The bulk of the agricultural debt, for one thing.

3856. Land Revenue?—Not land revenue; land revenue is also one of the contracts; but I mean the borrowings of the agriculturist from his banker or moneylender.

3857. Are they in the nature of mortgages?—Yes.

3858. What periods do mortgages run for as a rule?—It is not a few months or even for a few years; they run on for years together.

3859. They are repayable?—In agricultural business the farmer repays when he has a surplus; if he has not the banker has got to carry him. That is one class; then there would be in industries a great deal of borrowing on debentures or in other forms and that also would be for ten, fifteen, or twenty years; it would not be short.

3860. All fixed investments?—Yes; and fixed long term investments would necessarily have been on the 1s. 4d. rupee basis, because the 1s. 6d. rupee was in existence for very brief periods, as I pointed out.

3861. Then there are long term contracts of service?—Yes.

3862. On the other hand, all ordinary contracts for the purchase and sale of commodities and all contracts upon which wages are based are characteristically short term contracts, which work themselves off either in the space of a few moments or, at the most, at a month's notice, and so on?—The position is this: these are short term contracts and theoretically you can say that the question was simple because you have simply got to revise them and there is an end to it; but it is not so easy to do as to say, because the moment you want to revise wages downwards, as this would make us do, there is a very severe conflict, as there was, as you are possibly aware, till only a few days ago in Bombay—a big mill strike. Wages have been mainly on the basis of the 1s. 4d. rupee; they had been revised upwards to come into parity with 80 or 90 per cent. over pre-war levels, and then if you make the rupee 1s. 6d. it means that these wages have got to be readjusted, and industrial wages cannot be re-adjusted without very severe social disturbance. Then, sir, we might be told that these industrialists are trying to get out of their responsibility and that the Government would not be concerned in it. I would point out, as regards that, that Government themselves have raised all the wages of their employees, from the highest downwards, and adjusted them to fit in with the so-called high price level. If Government think that these adjustments are possible, let them begin by setting us an example and by cutting down the salaries of their employees, covenanted or uncovenanted, by 12½ per cent. I think that this readjustment is not so simple as people make it out to be, and, if after readjustment things are to be where they are, then why go into it at all, and why create this social and industrial upheaval?

3863. Why create this social and industrial upheaval?—Because if I may be permitted to make it clearer——

3864. Might I put a question on that point which will serve to lead you in your evidence? Your last sentence suggests to me a point on which the Commission would like to have more illumination. You ask, why create a social and industrial upheaval by adopting the current rate of 1s. 6d.?—By compelling employers to make a reduction of wages which the current rate would imply: that is what I mean.

3865. The point upon which I think the Commission would probably welcome your opinion is this: Have wages and prices not substantially adjusted themselves now to the current rate of exchange, and would it not, just to complete the question on the other hand, rather be creating a social and industrial upheaval to take measures for the change of the rate from the present rate to some other rate, be it higher or lower?—My reply would be this, that the present wages in industries as well as in all the services, including the Government services, have been at figures which have been fixed a good deal before October, 1924, when this 1s. 6d. rupee was nominally effective—it was a sterling rate—and very long before April, 1925, when it was a gold rate; and you will find if you call for evidence on that point from employers and from Government Departments that these wages and salaries have not been adjusted and could not be adjusted; it is not feasible. The employee does not understand this manipulation of exchange rates and he could not be induced to see the reasonableness of the reduction because the exchange has changed. Then, sir, there is the very much larger question which comes in, that if these wages have to be reduced in any case in order to adjust things, they can only be reduced by employers being forced to do it; they would not voluntarily invite such a struggle; and employers being forced implies again that they will be working at serious losses, and some of them driven to the point of insolvency and find no other resource but to cut down their costs in order to exist; so that it is not only a question of a few men getting a penny or 2d. or 3d. less per day; but it is a question of the industries as at present owned continuing. Undoubtedly some of them who are sufficiently strong to stand the shock may continue; but the weaker ones are not able to do it and the proof of it is the liquidations that have been going on in the last two or three years.

3866. In your opinion would you expect in India, under present conditions, to find wages, supposing adequate indices as to wages were available, showing the effect, reacting, that is, with reasonable promptitude to changes in the rate of exchange, or are you of opinion that there may be other influences, quite apart from the effect of exchange rates and prices, affecting the general movements of rates of wages in India which would mask the effect of prices upon wages?—Well, Sir, as far as the wage earner is concerned, and even the capitalist who employs him, I am quite sure neither of them understands that exchange has anything to do with it. The bulk of them do not understand it.

3867. My question rather is this: apart from what the employees think, are there other influences at work, affecting the rates of wages in India, which would tend to mask the effect of a change of prices brought about by changes in the rate of exchange, for instance, the general education of the wage earners, teaching them to expect and to extract higher wages and a better standard of living?—That would be correct; but I do not see how that has a bearing on the exchange unless you can make it more clear to me.

3868. If I may say so, the mental comment which I should register for my own benefit on that would be not to expect to get very much illumination as to the adjustment of wages from any particular rate of exchange. Have you any statistics as to wages?—My point would be different. Apart from any causes which you have in mind and which may also influence wages and prices, this is one of the particular causes which directly influence prices and, through prices, wages; and what I say is if this unnecessary interference with prices and wages is avoided, it would certainly be highly desirable because other causes will continue to operate and influence wages and prices. That I do not dispute.

3869. Now, turning from wages to prices more particularly, let me refer you to such index numbers as there are available of general prices in India. I imagine you would agree that too much reliance must not be placed upon them as a guide?—Yes; if you put it that way I am entirely in agreement; I would not take them as a guide at all. If you do so, I would take them with very great discrimination.

3870. We must be fully alive to the necessity for caution, but accepting them for what they are worth, would you say that the general Calcutta index number showed that, on the whole, prices had adjusted themselves in India to the present rate of exchange or would you say that, for what they are worth, they do not show that?—The answer would be that prices, at every moment in a country like India particularly, which has practically all its main lines of produce exported, are bound every moment to get adjusted to the rate of exchange. There is no question about that, but whether those prices are fair to the producer is an entirely different question.

3871. If they are adjusted at the present rate it would follow that, if the rate were to be changed by some such procedure as is described in the concluding portion of your memorandum there must be a fresh disturbance in prices?—It would not be a fresh disturbance, Sir, because the disturbance has been there for the last five years; practically every month, if I may say so. The disturbance has always been there. And then, have you the figures before you—the Calcutta index—if you will permit me I will pass them on to you.

3872. The Commission has them?—It is on them I am trying to base my reply. It is not enough to merely look at the general average. It is the most misleading thing here. You have got to look at the particular items and then you will find that the items of Indian production on which the income of the agriculturist depends—and you no doubt know that the agriculturists are the largest part of the population—are all very much below the general price level. So, if there is any real readjustment of prices which gives the agriculturist a slightly higher level than he gets now, it would not be an unfair readjustment but a fair readjustment, a necessary readjustment, if I may be permitted to say so.

3873. I should like to ask you a question which you may find too hypothetical to care to answer, but I should find your answer illuminating if you could give me one?—I will try.

3874. Supposing that time had gone on and that, by natural forces, the rupee had remained stable round about some level, say its present level?—How, by natural forces? Will you kindly explain?

3875. Let me cut it out if it is going to cause any difficulty?—Because there is no such thing as a natural level—it is the level on which the rupee is valued in gold.

3876. I quite agree that it was an unnecessary introduction?—That word "natural" has also been very much abused in this country in controversy.

3877. Supposing the rupee remained at a level of 18 pence and continued to remain at that level, would your opinion be that, however long that period continued, still in view of the past history of the Indian currency it was right to go back to 1s. 4d., or would there come a time when you would accept the *status quo*?—I hope no offence will be understood from my reply. The rate of 18 pence has been in India for not more than 8 months. The Germans were in Belgium for five years but because they were there the British never admitted their right to remain there. If a thing is wrong, it is wrong. It is no argument to say the thing is there, the robber is in possession, and you ought to allow him to continue in possession. The thing is that you come to the conclusion that the thing is unfair, unjust to the bulk of the population and particularly to the poorest as I hold, and the only thing that Government should consider is whether justice does not require going back. The continuance of the present rate would mean this, Sir, which I am afraid is not properly appreciated. It will mean that the agriculturist will be getting much less money than ordinarily he should. His mortgages will some of them fall in and he will become, instead of the owner, a tenant-occupier as has happened on a large and increasing scale in the last two or three years on the Bengal side. Only this year the jute prices have saved them. Now, Sir, the retention of this ratio will mean that a great number of agriculturist owners will disappear and become tenants, industrial owners will become bankrupt and their plants will be sold at lower prices to other capitalists. And of course, after all that adjustment is completed, say five or ten years hence, we should be no better off than we were in 1900. Do you think that desirable? Should we do it?

3878. No. I think you have answered my question very fairly. You would suggest that, if the state of affairs which you consider to be very undesirable worked inequity, if it were to continue for a long period—you mentioned ten or twelve years?—That is not for the 1s. 6d. rate.

3879. I thought I understood from your last answer that there would come a time, if the inequity continued, when things would be adjusted, and you would not recommeud a change?—After 10 or 12 years? Well, Sir, most probably I would not. But the effect would be like that of plague or influenza. A great many who now live would have died, a younger generation will have grown up and have forgotten what was done, and they would say: "No, we don't want any change." But the generation to-day that is plagued with these things, they want to get back to a rate which will do them justice.

3880. But, then, the determining circumstance as to when time would have elapsed after which it would not be worth while to change would be whether all the evil consequences of the original change had worked themselves out and things had settled down on a new basis?—Do you wish me to imply, Sir, that on that understanding I would agree to the rate remaining as it is?

3881. Not at all. There was no such implication in my mind?—Of course, if a thing has been there for many years, then, with the world as it is, we are always inclined to let bygones be bygones and allow things to go on as they are. But fortunately, I don't think it is too late even to-day to do justice because we have not been very long on this standard. This 18 pence gold rate was only effective in March or April, 1925. This Commission is listening to my evidence in December, only eight months after. So, if 8 months is considered such a long period that a rate established has got to be borne with—or even 18 months, because most probably your Commission would have to go over to England or America to get further evidence—I would not say that any further arguments should be allowed now to stand in the way of going back to the correct ratio. And may I point out that that was the understanding on which Lord Farrar very emphatically said that he had signed the report of the Herschell Committee. In the Fowler Committee he was put that question and this was his reply: "Undoubtedly Sir D. Barbour intended the gold standard as an essential part of the scheme of 1893 and I think you will find that Lord Welby and I expressed a strong opinion to that effect. I would never have signed the report of 1893 unless I believed it would lead to a gold standard." Then he goes on: "To fix upon a certain ratio is important. But a still more important thing is, when once you have got a ratio, not to change it." Now when we changed over from silver to gold there was no option. Whether that policy was right or wrong is a different thing. But if I had been asked in those days: "We have decided to go to gold instead of silver; now what are you going to do"? I would have said: "The next thing is to fix a ratio, so that the rupee may have a definite gold value." After you have done that, I think it is entirelyunjustified to continually vary that ratio, and the proof of it is that England could have very conveniently varied its own gold contents of a sovereign when the New York rate was a good deal below four dollars. On the contrary,

England decided that if justice was to be done all round, she must go back to the pre-war ratio and she has done so. And every other European country which is solvent has gone back to the pre-war ratio. The only countries which have not done so are those which are insolvent; they have not gone to the pre-war ratio. They have had to devalue. Which really means that when I am very heavily in debt and cannot pay to the last pie, I compromise with my creditors and say: Take 10 per cent. or whatever it is. But that is no proof that variation of ratio is justified.

3882. As you say, several countries have established the pre-war ratio, but nevertheless the change in gold values has effected an enormous alteration in the balance as between debtors and creditors throughout the world?—You mean by the gold value of debts?

3883. Yes?—Well, Sir, that is all the more reason why England and other countries should have changed their ratio and they have not. And I don't think we should do it, because it implies that the gold value of commodities is going to remain high. That was the fundamental mistake of the Babington-Smith Committee.

3884. Let me make it clear. Assuming we changed the gold value of commodities, will it not also effect a very substantial alteration in the position as between debtor and creditor in India?—Well, it will be like this. It would affect the position in a year when, to take an instance, the price of wheat was very high and if a farmer's debt matured in that year, he would escape by selling a small quantity of wheat. On the other hand, if the price were very low, he would suffer. But that is no reason why a contract entered in terms of gold should be varied, because the alteration of the gold value of the commodity is not going to make the creditor accept less gold or more gold. Supposing I had borrowed a thousand rupees and to-day I go and tell that man: Take only 800 rupees because it is going to get you as many commodities as a thousand rupees did a few years ago. He is not going to do that.

3885. Would it not seem to throw some light upon the supposed sanctity of the measure of value when you find that the gold value to which that measure is referred is itself variable?—Well, Sir, to the gentlemen who come from England I need not detail all the controversy that you have had to go through in the last eight months but, although gold is a variable commodity, it has been the drift of authoritative opinion that on the whole if you have to adopt one substance as your medium of payment, then gold has been found much more suitable than anything else. So we have to go on that. To argue about the variation of gold and the necessity of changing prices would lead us into a fruitless controversy. Assuming you fix it at 18 pence, you are not guarding against variation of prices in 1930 or 1935.

3886. I think that is rather a point that might be made in the argument against the sanctity of the 1s. 4d. rate?—Well, Sir, it might be important. It is for you and the other gentlemen on the Commission to consider how far that argument is sound if England has brushed aside that argument after very full consideration.

3887. We are looking back, are we not, on a past which does not show a single change from the 1s. 4d. rate to the present 1s. 6d. rate but a past during which there has been a period of violent fluctuations?—That was the period you mean during the war.

3888. Yes?—And just after the war.

3889. The point that I wanted to ask your view upon is this. In view of those considerable fluctuations in price which have obtained since the war, do they not render any disturbance in contractual relations necessitated by stabilization at 1s. 6d., a very minor one in comparison with the disturbances which have taken place in the immediate past?—Well, Sir, first of all my reply would be that although the fluctuations were supposed to be very wide, they were fluctuations in sterling money, which was not gold at all; and converted into gold, I have tried to point out that for the largest part of the war period also they were as near 16d. as possible. During the post-war period also they were at 16d. and that is an argument for going back to 16 and not for 18d.

3890. There is one question I should like to ask as to the mechanism by which you propose to restore the ratio of 15 to 1 which you outline in the concluding portion of your memorandum. You say that it should be the declared policy of the currency authorities to return to the ratio of 15 by gradual stages. The suggestion which I want to ask your opinion on is this, that once the policy was declared by the currency authorities of returning to the ratio of 15 to 1, it might be impossible to maintain any graduation in the process; it would be immediately anticipated by speculators in exchange, and that would result in a sharp slum in exchange to the ratio of 1s. 4d., which might result in a very great disturbance to trade and industry, reacting upon the people of the country. What is your view upon that possibility?—I will give my views. In 1923—Mr. Aiyar will correct me—exchange about early in March was 1s. 4d. or something like that. It went up about the end of the month to 5¼ and 5½, and suddenly, because Government accepted tenders of Councils at $\frac{1}{16}$ or $\frac{1}{8}$ less than they had before, bankers in Bombay and Calcutta came to the conclusion that Government was trying to go back to 1s. 4d. Suddenly there was a big slump. Speculators and bankers began selling, and the rate was in a couple of days 1s. 4⅛d. Such things have happened even during the last two or three years, so if in trying to go back to the correct ratio such things happen again, that should not be an argument for not doing it. I will now explain to you, Sir, why I think there is no very great danger of that. The balance of trade has been in our favour even during the current year, in the last nine months months, and very heavily; and there is another consideration: the balances of the previous two or three years have also not been thoroughly liquidated on account of this peculiar exchange position. If you compare the visible balance of trade after deducting everything, treasure and Council Bills and remittances and everything, you will find that many crores of rupees remain unaccounted for. It is very difficult to say where those rupees are and where they are now hiding; but it is possible in the present currency position that holders of all that sterling or foreign money would hold on until they come to the next year when some of this is liquidated and that way some of the balance has been carried forward year by year. The point of this remark is that this year we have a heavy visible balance of trade in India's favour. There is most probably a very considerable amount of the balance of trade of India which still remains to be liquidated, and we are now in front of a very busy season. If the Government could make up its mind, something like this would be our position. There would be already an excess of a hundred crores of exports to be looked after for the current 12 months. There would be perhaps 30 or 40 crores of excess of money brought forward from previous seasons and not liquidated immediately. What would happen is that these holders of the proceeds of exports would continue to bring their money in; the new exporters, people who are shipping to-morrow or next month would have to go through somehow and get their goods converted into money; so the position would be very much in favour of a higher rate; so that even if Government announced 1s. 4d. to-morrow, that rate is not likely to come to-morrow. There would be fluctuations, I entirely agree, but at every fluctuation the exporter will come in because he is so heavily in excess of the importer that his balance has got to be adjusted in some way, and in that way the Government will be able to get a control of the position. To-day they are in control of the position simply on account of that; if India's

monsoon failed to-day, it is to my mind clear that Government could not have kept exchange where it is except by trying to sell Reverse Bills in what is called the natural way. So to-day you have this excess which permits the Government to keep a control of all the excess balance of trade which required to be converted into Indian currency, and by keeping control of that or only coming in to convert a small part of it at a time and leaving the market to adjust itself just as it likes, I think the position might be found to be that the fluctuations would not be as sudden and violent as you, Sir, seem to apprehend but comparatively minor ones; and those fluctuations we have been used to for the last five years.

3891. The time has advanced and I will ask you only one further question on this point, possibly in a lighter vein. Under the heading "Relation of the Rupee to the Mohur" in your memorandum (Appendices—page 158) you quote in support of your case an old memorandum of the Treasury. You say: "If on the other hand it is the case that the value of the rupee has fallen in India and that it would be raised in India by the operation of the proposed plan, that plan is open to the objection that it alters every contract and every fixed payment in India." What would you say to a critic who turned your quotation against you thus: "If on the other hand it is the case that the value of the rupee has risen in India and that it would be reduced in India by the operation of Mr. Madon's plan, that plan is open to the objection that it alters every contract and every fixed payment in India"?—I am afraid you have overlooked one point, namely, the volume of contracts that are affected and whether the change has been natural or artificial. Now India's rupee in those days was a silver rupee, it was merely a part of silver. It did not matter what it was worth in terms of sterling. That rupee it was said was a tola of silver and Government wanted to raise it from its real market value of 20d. to 24d. and the Treasury objected because it varied the contracts. The argument emphatically applies to what is being done to-day and has been done in the last two years because we were at 16d. only 12 months ago and we were at 16d. for 25 years, and the contracts which would be violated would be those contracts, while the contracts that you speak of to-day at 18d.? Which are the parties that have made the contracts? I have already pointed out that wages and salaries are still to-day where they were 12 months ago. The only contracts that would be affected would be the contracts of importers, people who have bought goods abroad and have sterling or foreign liabilities to pay. As I have pointed out, exchange is available even for forward deliveries to-day freely, and anyone who wants to cover himself may cover himself; so this argument I think is very emphatically in my favour.

3892. (*Chairman.*) That brings us back to the answers which you have already given on the question of the extent of the adjustment to the present rate. I should like to ask you one further question upon the previous topic of discussion, but before I do so, if there are any subsidiary questions on the rate they should be asked now.

3893. (*Sir Maneckji Dadabhoy.*) May I suggest that this is a very important subject and that there are many members who would like to ask questions at some length. I would probably ask a few questions on this point and if you have no objection and if Mr. Madon will kindly agree, it would be better to have him again to-morrow.

3894. (*Chairman.*) I am afraid we cannot, because we have already made arrangements with other witnesses?——I should be glad if you can relieve me to-day because I feel rather tired.

3895. (*Chairman.*) I must then express on behalf of my colleagues our thanks to you, Mr. Madon, for your most kind and full assistance to-day.

(*The witness withdrew.*)

TWELFTH DAY.

Wednesday, December 9th, 1925.

Present:

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Maneckji Byramji Dadabhoy, K.C.I.E.
Sir Henry Strakosch, K.B.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.

Mr. A. V. V. Aiyar, C.I.E., } (*Secretaries*).
Mr. G. H. Baxter, }

Professor C. N. Vakil called and examined.

3896. (*Chairman.*) You are a Master of Economic Science and Professor in the School of Economics and Sociology of the University of Bombay?—Yes.

3897. Have you been long in occupation of that position?—I was for three years on the staff of Wilson College, Bombay, from 1916-19, doing similar work. I am in the University since 1921. This is the fifth year of my service in the University.

3898. You have been good enough to provide us with a very full memorandum* of your views which the Commission has studied with interest. I will ask you a few questions to discover what emphasis you attach relatively to the various recommendations made and to elucidate any points which appear to need elucidation. Let me ask you to refer to that portion of your memorandum headed 'Remedies' (Appendices —pages 179-180) where you arrive at the conclusion 'that no partial changes in the gold exchange standard system as it exists to-day will remove all these defects.' The preliminary questions I want to ask you will be directed towards

* Appendix No. 19.

getting a little deeper into that conclusion by asking you to do this: to take your summary of defects just above and tell us whether or not in your opinion they could be remedied by a perfected and improved exchange standard system. That is an essential preliminary before proceeding to your positive recommendations. Perhaps I may put the questions to you one by one so as to bring out the points which will be of most assistance to the Commission. In the first place, in the course of your historical comments you say that the internal stability was upset through a course of years by the over-issue of silver rupees. Might I ask you on that: It has been suggested to us in evidence that the gradual changes in prices were due not so much to the over-issue of the rupees as to the approximation of Indian prices to the world prices which had previously not been approximate, owing to the general historic position of India as a member of the world's industrial system. What would you say to that?—In the paragraph headed 'stability of internal prices,' I have given a sentence to say that if we compare the level of prices in India during the pre-war years with the level of prices in other gold standard countries like England or the United States of America, we find that our prices, the level of our Indian prices, is higher than the level of prices in gold standard countries and that leads us to the conclusion that in the increase of prices in India some share must have been due to the increase of rupees coined by the Government.

3899. I want to supplement that by putting to you the suggestion that there was in fact a lag in Indian prices behind the prices in those other countries to which you refer, and that what was happening was not an artificial rise in Indian prices owing to the inflation of the currency but that it was due to India gradually coming into closer touch with the outside world, adjusting its prices to those of the world in general?—It is always difficult to find out the exact causes of changes in price levels of different countries and there are usually more than one cause. I am prepared to admit that, and one of the causes may be said to be the adjustment of India's trade conditions with other countries outside during the years say the first 14 or 15 years of this century; but looking at the figures in detail, though I find that this may be said to be one of the causes, I should equally well say that the other cause was the large issue of currency, I mean of rupees.

3900. Taking such index numbers as are available, I find the following changes in prices. Taking 1895 as the base level and 1913 as the year of comparison, comparing India, England and United States, in comparison with a base of 100, the figures for 1913 are India 138, England 137, United States 141. Does that, for what it is worth, not seem to show that there was a rise in Indian prices which was not greater than that in any other country, but that what was taking place was really only a similar and proportional rise in Indian prices?—My contention is that we should see the thing over a series of years. It may be that in a particular year the level of prices in India will be more or less similar.

3901. The period of comparison which I have given is 1895 to 1913. That is, as I understand it, the period to which you are referring?—Yes, pre-war years; that is all right.

3902. Continuing, let me pass on now to your summary of the defects. Taking the first defect, you say: "The expansion and contraction of currency is not automatic, and the management of this function leaves room for grave mistakes on the part of Government." That is a criticism upon which the Commission has already received evidence *in extenso*. Let me ask you whether an exchange standard system might not be devised which would provide for the automatic contraction of currency by the combination of the gold standard reserve and the paper currency reserve into a single reserve, so that the amount of the reserve must rise or fall automatically with the issue of international currency against the receipt of internal currency. Would not that have the effect of making the currency automatically contractible and of remedying this defect?—For that I would take as the basis of discussion the two schemes* which the Commission has been kind enough to send on to me and in scheme No. 1 some improvements are suggested.

3903. The scheme which I have just referred to in order to obtain your opinion on the point is in this memorandum* which you have been good enough to consider. The scheme referred to is the one in paragraph 4, where it is rather singularly described as an "attractive" proposal instead of an "alternative" proposal. Would this alternative proposal in your opinion provide a remedy for the defect in question by effecting an automatic contraction of the currency under given circumstances?—If the practical step suggested in the scheme works smoothly without defect, without undue loss, there is a hope of getting contraction of currency on automatic lines. But in paragraph 2 (H), there is a reference to a separate reserve which the Government will have to maintain for the redemption of rupees.

3904. That is the first alternative. I think it would make it more clear if I were to ask you to confine your attention to the alternative proposal in paragraph 4. There, as I understand it, if I am not taking you too fast, your opinion is that theoretically it is possible to do so?—Yes.

3905. I come to the second part of the paragraph, the management of this function on the part of the Government. As I understand it, that underlies your criticism of the pre-war system, that it was in the hands of the Government, and that it was possible for the Government to manipulate it?—Yes.

3906. Now let me ask you whether, in your opinion, that defect could be remedied by the maintenance of the exchange standard by the transfer of the management and control of the note issue and the reserves against the note issue from the Government of India to a Central Bank. Would that provide an effective remedy for that official interference which you deprecate?—That is the best that you can do under the circumstances, I suppose. The criticism against Government manipulation will certainly be less if the management is in the hands of the bank.

3907. You think that is the best that can be done in an imperfect world?—That is the only thing I can say, I suppose. There is some criticism always if there is any trouble or if any party is affected; but that is the best that can be done under the circumstances.

3908. I will ask you further questions about that when we come to the full gold standard, because I think it is possible that the weight of your evidence may be slightly shifted if you look at it from that point of view. Now taking the second defect, "the absence of a legal obligation on the part of Government to give gold for rupees does not secure the automatic stabilisation of the rupee," could that be remedied under an improved exchange standard system by the acceptance on the part of the currency authority of the legal obligation to give either gold or foreign currencies for rupees?—Yes; it is possible to remove the defect under the scheme proposed.

3909. Under defect (3) you say: "The pre-war system was directed to attain external stability of the rupee, but in doing so the internal stability of the rupee was sacrificed." I think there I must anticipate a little the course of the examination by asking you how and why you would attain greater internal stability with a gold standard, such as that which you outline, than is attainable with an improved exchange standard which would stabilise the external value of the rupee?—Under the proposed gold exchange standard, the issuing of rupees, the additional currency, will still rest with the Government. Under the gold standard scheme suggested, the issue of additional currency will be adjusted from

* Appendix 2.

time to time with reference to the requirements of the people and the general complaint that it is possible sometimes for Government to increase the issue of rupees in relation to the requirements of the people and thereby lead up to an inflation of the currency and consequent rise of prices, that criticism, will go.

3910. But is that so, Professor, with a perfected exchange standard?—But even then the coining of rupees remains with the Government, and there won't be a free silver mint just as under the gold standard there would be a free gold mint.

3911. In what manner do you suggest that the Government could make any artificial issue of internal currency in excess of the actual requirements as indicated by the offer of the international currency?—I presume that if the gold exchange standard on the improved lines suggested continues, the present system of selling Council bills and the existing machinery will also continue. If that is so, in other words, if the Commission will leave it at the discretion of the Government, there is the possibility for an additional issue of currency from time to time.

3912. I am not sure I follow that. We are contemplating a system in which there will be a combination of reserves, a single reserve, and there will be a legal obligation on the currency authorities to buy and sell the internal currency either—(I do not think it is material for our present question to say which)—against gold or against foreign exchange. Under these circumstances, in what manner could the currency authority tamper artificially with the amount of the internal currency?—Well, so far as additions or contractions in the currency take place in the manner suggested by you, Sir, it would be all right; whenever council bills are sold by Government as hitherto there would be corresponding issues of additional currency in the country.

3913. Let us clear that region by making a further assumption, and that is that the remittance business of the Government of India is conducted by the same authority as controls the note issue, say the Central Bank, and that that business is confined to meeting month by month the actual requirements of the Government of India for remittance, and thus that the Government goes out of the exchange market altogether?—If that assumption is made then the objection goes.

3914. Now we come to an important heading, part 4. "The system will break as soon as the price of silver rises to the rupee melting point." I want to put my question in this form. If you maintain the silver content of the rupee at its present amount, in so far as the rupee is concerned, will not any system break as soon as the price of silver rises to the rupee melting point?—What I mean (this is an abbreviated sentence), what I mean is the maintenance of the exchange value of the rupee and the general features of the system will break. Of course, the rupee will be there for circulation, but it will not be possible for the Government to maintain permanently any point at which the rupee will have to be fixed either in sterling or gold.

3915. Let me again anticipate. We may assume, I imagine, that, under your full gold standard, there will still be a very large amount of rupees required in circulation as small change?—Quite so.

3916. What would be the effect upon that volume of rupee currency under the full gold standard as soon as the price of silver rose to the melting point? —If that is so, supposing for the sake of this argument that the full gold standard is established, the position of the rupee will be somewhat similar to the position of the shilling in England. When the rupee is reduced to that subsidiary position when it is a limited legal tender, the danger of the rupee reaching the melting point is less. If the weight and fineness of the rupee is retained, of course, at a certain stage, there will be the danger of the rupees being melted; but when the rupee is made limited legal tender, in order to prevent this happening, it will be perfectly open to the Government to reduce, if necessary, the fineness of the rupee, as was done, if I may say so, in some countries during war-time.

3917. Perfectly; as was done in Great Britain soon after the War. We are assuming a very large circulation of rupees. The rupee, even under these future conditions, will still, I imagine, remain the only familiar coin to the less instructed and the poorer classes of the community?—Generally speaking that is true.

3918. After measures have been taken leading up to the possibility of a debasement of the rupee coinage, what in your opinion will be the effect upon the minds of the uninstructed people of a change in the silver content of the rupee? What will the social and political reactions be?—I do not think there is any apprehension of any serious danger of that nature. In the course of time—if you take, say, 10 years as the scheme here suggests to establish a full gold standard, and if in course of time the rupee does become a subsidiary coin of limited legal tender, though the poorer classes of people may not be rich enough to handle a gold coin for some years to come, they will certainly know that the real unit of currency is the gold coin and the rupee a mere matter of convenience. The importance at present attached to the rupee will automatically disappear as soon as that is known, and when such a system is introduced the Government will no doubt see that there is wide publicity given to the question, and there is no danger of the nature described by you, Sir.

3919. Now we come to No. 5—"the system will also break as soon as sterling reaches gold parity," that is, if the system be a sterling exchange system. Might not that defect be remedied by establishing the system formally as a gold exchange system?—That would be all right theoretically, as was attempted by Government very recently; but most of our transactions are done in sterling, and though we may stabilise the rupee with gold, our daily trade transactions in sterling will be liable to fluctuations.

3920. As long as sterling and gold remain at par no trouble will arise from the practical point of view?—Quite so.

3921. I suppose it may be contemplated that sterling is only likely to leave parity with gold in future in the case of a violent convulsion, or do you think it may occur owing to the failure to maintain parity?—Normally the parity of exchange will be maintained by the British Government.

3922. To guard against the possibility of a convulsion resulting in a separation of sterling and gold, is it not adequate to make some provision, theoretically if you like, by which in addition to undertaking the liability to provide sterling for internal currency, the liability should also be taken in case of need to provide either gold for export or the currencies of other gold standard countries?—That will have to be done if the gold exchange system has to be improved and continued.

3923. Would that not provide an adequate remedy, both theoretical and practical, for any defect in the linking of the Indian currency with sterling?—Theoretically it would provide for the maintenance of the rupee at a fixed ratio; but as a practical remedy, if I may also anticipate, it will involve certain troubles and difficulties which I believe will not be less than the troubles and cost involved in the introduction of a gold standard.

3924. The point I want to make my mind clear about is this. Can the troubles and difficulties which would result in the event of a further separation between gold and sterling be guarded against by the adoption of this or that currency system in India? As you quite rightly told us, the vast bulk of Indian trade is settled in sterling. If sterling separates from gold, can the difficulties and troubles thereby caused to Indian trade be avoided by one system rather than another system of currency here?—If India were on a gold standard, if the unit of our currency were gold, and that standard were maintained, then it would be possible for us to deal with foreign goods and countries on a footing of equality.

3925. Would not that also be the case if India were on a gold exchange standard as distinguished from a sterling exchange standard? You say that, in the event of sterling separating from gold, if India were on a full gold standard it can continue to deal without dislocation of its exchange with other gold countries. Would not that also be the case if India were not on a full gold standard but a gold exchange standard in which the rupee was linked to gold and not to sterling?—Then there would be the objection I mentioned just a little while ago, our ordinary transaction being in sterling, if we base the rupee on gold or sterling currency, there would be the possibility of fluctuations again.

3926. As regards the question of confidence in paragraph 6, the point that I want to ascertain there is this. Your opinion is that, in order to restore general confidence in the value of the currency nnit, it is necessary to have a gold currency, and to make the unit visible gold?—Yes.

3927. From yonr knowledge of the habits and psyohology of the people, might that object be obtained equally, or might it not, if, as the result of a period of the exchange standard, the gold value of the rupee had been so stabilised that people were growing accustomd to finding that the value of their currency, although not actually interchangeable in gold, was nevertheless stable in relation to gold?—That would certainly be some improvement, but I should not say it would be as good as the full gold standard.

3928. Finally, in paragraph 7 you say the management of the money market is not what it might be because the resources of the country are not under one management as with a Central Bank. That is not a matter which is strictly relevant to which currency is adopted, because, acting upon such a scheme as the one we have referred to here, you might equally with an exchange standard as with a full gold standard combine the currency resources and the exchange resources as to their management with the banking reserves?—I quite see that point, Sir.

3929. May I pass on from that little examination of the defects of the present system to a consideration of your own positive proposals. They are very clearly summarised in your paragraph at the end of your memorandum. Let me ask you, in the first place, what is your ultimate ideal of a currency system for India? Do you look upon your full gold standard system as the ultimate ideal, or are you looking forward to a further change when the currency system of India will become a paper note inconvertible internally and convertible only into foreign currency for purposes of international payments?—I do look forward to that second stage of development later in the future when the only legal tender will be gold notes, and arrangements will be made as in England to give gold, to buy and sell gold, for such purposes.

3930. Now to test that opinion, if I may, let me put to you an alternative point of view which has been put to the Commission, that by the natural education of the people in the use of the note the nation is now progressing towards that ultimate ideal which will be attained in the not unduly remote futnre, and if you let things go on as they are at present, you will find owing to the process of education the people of India adopting the note currency, and that that would be promoted by the stabilisation of the rupee, but that it is unnecessary in order to advance it to incur the expense of a full gold standard?—I am sorry I do not agree with that position. The rupee was stable from 1899 to 1914, and the people of the country were certainly accustomed to believe that the rupee was equal to 1s. 4d. Stability was nnderstood. The note circulation had also increased during those years. It is certainly true that during those very years large imports of gold came into the country and could not go into the currency because no gold currency existed; and these gold imports came into the country in spite of the fact that large amounts of gold were diverted by the sale of council bills in England, and all that gold which went into hoards was not used productively for the capital requirements of the people. That is a greater and more extreme waste, I believe, than the expense which will be involved by introducing a gold standard. During those years, 1899-1914, when the rupee was stable and the gold exchange standard seemed to work all right, we were, on the one hand, importing gold in large quantities into the country, and, on the other, we were raising sterling loans in England. If that gold was avalable for currency purposes and the people of the country were accustomed to use gold we would have been to that extent less required to borrow outside or to increase our external debt to a lesser extent than before.

3931. As regards your suggestion in paragraph 4 that foreign capital will be more readily available under a full gold standard system, what foreign capital requires, I suppose, to tempt it is a stable exchange, does it not?—Yes.

3932. To avoid exchange risks?—Yes.

3933. Making that supposition if you will, if that stability of exchange is attained by an exchange standard system, is there any further advantage as regards the attraction of foreign capital which is conferred by a full gold standard?—That is generally true, if the exchange value of the rupee is maintained by an improved gold exchange standard system. The attraction to foreign capital will be there to a great extent; but the first part will not be true; the second part of paragraph 2 will be all right. The first part is that people will learn to use their hoarded gold in a better way; and if I may be permitted to point out, the necessity for foreign capital may not be there if the hoarded gold or the future incoming gold can be used to a greater extent than now, and I believe that was the drift of the speech which the Honourable Sir Basil Blackett recently delivered in Delhi to the students of the Delhi University, where I think he tried to make out the point that we have latent resources in India, resources so great that we can not only supply our own capital requirements, but also make the country able enough to lend to others; and I think at the back of Sir Basil Blackett's mind the idea was that, if I may be permitted to say so, it is the hoard of gold which is not able to come out under the existing system, or the incoming gold which may be hoarded otherwise, which may be thus utilised, and to the extent to which Sir Basil Blackett could not obviously refer to these questions, as they are *sub judice* here, I think his speech was incomplete.

3934. As regards the question of hoarding, your argument proceeds upon the assumption that there is at present a strong inclination to hoard gold?—Yes.

3935. You are of opinion that that habit may be remedied after a period by a growing confidence that the value parted with by the holder can be recovered from the equivalent currency?—Yes.

3936. In fact, it is important, is it not, that that process of the restoration and growth of confidence cau be only a gradual process?—Yes; it will take a few years.

3937. Is it your opinion, or is it not, that the immediate result of making gold thus freely available as you suggest might at first provide means for further hoarding. To put it quite crudely, is there not, in your opinion, a danger that if people want to hoard gold the more you give them the more they will hoard?—I do appreciate the difficnlty that in the very early stages when the introduction of the gold standard is contemplated there may be some difficnlty and there may be some rush on the Government to get gold; but as soon as things settle down and the people are convinced that they are having a gold currency and confidence is restored, I think the tendency will be in the other direction and a better one too.

3938. We observe, then, that the position with which we have to deal is the possibility of an immediate rush for gold, and a further possibility, which

is a more remote possibility, perhaps, that that rush will cease and that not only will there be no rush for gold, but the gold will come back?—Yes.

3939. Now, let me ask you a preliminary question. You recommend that these steps should be taken at once?—I have said somewhere in the body of the evidence that these steps will have to be worked out by certain stages.

3940. I want to see what the stages are. Should these stages come at once or after a period? The coinage of rupees should be stopped and the demands for additional currency should be met by the issue of gold coins and notes?—I think that should be done as soon as possible.

3941. What would that possibility be dependent upon?—Upon the gold resources at the disposal of the Government.

3942. Are you contemplating here a legal obligation to meet demands for additional currency by the issue of gold coins and notes?—That legal obligation will have to be undertaken; it may not be undertaken in the early stages.

3943. I understand that what is in your contemplation here is that gold should be imported by the normal methods, that it should be presented to Government, and that it should either go into ordinary circulation after being minted as mohurs or that gold notes should be issued against it?—Quite so.

3944. Leaving No. 3 of your summary for the present, you say in No. 4 "that the Government should undertake, through the Imperial Bank, to buy and sell gold at rates approximately equal to the par of exchange, as is done by the Bank of England." That also, I understand, is the first step?—That is the first step laid down in the scheme suggested.

3945. Let me see exactly what you mean here. Do you propose any limitations upon the acceptance of the obligation to, shall we say, sell gold at or above the lower gold point, or do you mean that any amount of gold should be sold at that rate for any purpose?—I have said in the body of the written evidence that the gold may be bought in any quantities, large or small; but that the sales of gold should be limited to certain large quantities, as in England, say, 400 ounces.

3946. So that it is contemplated here that in fact gold should be sold only for export?—Not necessarily; I have simply copied the English system in suggesting this, and I do not think it is necessary to restrict.

3947. You do not propose any limitations to ensure that the gold sold is exported?—No restriction is necessary.

3948. What would be the consequence of that? You accept an obligation to sell gold, with the only limitation that there is to be a minimum quantity, shall we say, of 400 ounces; and at the same time it is generally known in the country that this is the first step in a process of currency reform which is to lead to the ultimate dethronement of the rupee?—Yes.

3949. Might it not be natural to expect that the consequence of that would be that there would be a very great demand for gold to replace silver hoards in the country?—There will certainly be some rupees presented to Government for conversion into gold in this manner. Now, the only general statement that can be laid down in this connection is this, that we have a very large country with a very large population, and the masses of the people, of course, will use rupees to a very large extent, and therefore the number of rupees which are in excess of the daily requirements of the people will be presented for such conversion.

3950. The number of rupees in excess of the daily requirements of the people; that is another way of saying the rupees which are in hoards, is it not?—It is right to say so, I suppose.

3951. That is what one is thinking of, the rupees which are laid up and are not actually needed for currency purposes. Have you been able to form any estimate of the extent to which rupees might be returned under such conditions as those, when the country sees that the rupee in the course of time is to cease to be legal tender?—I have said in the body of the evidence that it is always difficult to make such estimates; but if you take the population in round figures as 30 crores of people, and the largest estimate I have seen of rupees in circulation and in hoards as about 300 crores, that gives you Rs. 10 per head of the population.

3952. 300 crores, you mean, in active circulation?—In circulation and in hoards. I was looking the other day at the total number of rupees coined since 1835—it is about 600 crores in round numbers, or a little over. And I do think some rupees have gone out of existence by melting or exporting before the rupee became a token and by wear and tear and the estimate of 300 crores may be taken to be approximately correct for our purposes. If we have, therefore, Rs. 10 per head of population in this country, and consider the daily requirements of the people, I wonder if at the most optimistic calculation we could say that even one-third of the rupees will come back.

3953. That will be 100 crores?—That is the maximum.

3954. Let us assume that figure, that the amount of rupees that come back for substitution by gold is 100 crores. What do you think about the time at which it would come back? I know it is easy to say, as it were, that you can make provision for carrying on the operation by stages. But would you consider this—that the offer of gold for rupees comes at the same time as the announcement that ultimately the value of silver in large quantities is to be affected by the limitation of the legal tender. Under those conditions, do you or do you not think it probable that the greater amount of this 100 crores would come in pretty quickly?—I don't think so, Sir. I mean the stages which are suggested here for the gold standard scheme, the scheme given to me, those stages contemplate a legal obligation on the part of Government to give gold almost in the third stage which will be about five years after the scheme is launched. So that till then difficulties will not be so great and the conversion of rupees into gold will certainly be spread over a series of years.

3955. Have we not got to consider that Government may refuse to undertake more than a gradual increase by stages of its legal liability to take in silver against the gold given out? Is not the open market always open to the holders of silver hoards in case of a real alarm on their part, and might it not be that the silver hoards would be thrown upon the open market for gold bullion?—In actual operation I think the intermediaries for these transactions will be the bullion dealers. Even if the Government announces its intention to-day to buy and sell gold as is suggested here, I do not think the man in the street will be in a position to present gold in sufficient quantities to the Government and it will certainly be through the bullion dealers who may take rupees and give out gold in smaller quantities and ultimately give rupees for conversion to the Government. That will be the normal procedure certainly, I suppose.

3956. Then let me put another consideration to you. Even supposing you are confident that the demand for the substitution of hoards by gold will be a gradual one, nevertheless, in view of the considerations which we have just taken into account, is it not necessary to contemplate that, at worst, you might have the whole of this increased demand for gold and this increased supply of silver relying upon the markets in these metals within a comparatively short period; and when one is contemplating possibilities fraught with so much consequence, is it not right for a responsible Government to make provision against the worst that may occur

and not to count upon things going too favourably?—I quite understand the difficulty, Sir. But so far, if silver has to be demonetised, the rupee practically becomes a subsidiary coin, and the fall in the price of silver will not affect us very greatly.

3957. We will consider tho question of the silver prices in a moment. To lead up to that question, as soon as you decide upon introducing this system and limiting the legal tender of the rupee, reducing it to the position of subsidiary cash, the Government holdings of silver in the reserve become depreciated; in fact, they become no longer of use?—In a sense quite true. But they can be used by converting them into gold.

3958. That is the only practical use that can be made of them. So that, in addition to the hundred crores of rupees that come in from hoards, we have to take into account the ninety crores of silver and rupees which the Government holds in its reserves?—Yes, Sir.

3959. That is the measure of the amount which will have to be liquidated on the silver market?—Yes, Sir.

3960. Now, I want to consider first of all the effect upon the gold market of the additional demand for gold and the effect upon the silver market of the additional supply of silver. Have you been able to make any estimate of the amount of gold which will be required from first to last by the working out of your scheme?—I have not made any estimate, I think.

3961. We know what the Government has now; and then we have to supplement that with the estimate of the extra amount it will require?—I have not tried to work out an estimate here. In the existing reserves there is about 33 crores at 1s. 4d. and I have tried to lay down general proportions to show that certain large quantities of gold will be available to the Government; firstly by melting the silver worth about 190 crores, which we just estimated, and if necessary by the sale of British securities.

3962. These are the methods by which the gold can be paid for?—In which it can be acquired.

3963. What we are trying to get at here is how much gold it is prudent to provide for in order to put the scheme of gold coinage as outlined in your proposals on to its legs?—Certainly another very difficult thing to estimate. But I would hazard a guess on these lines. Supposing as we just started, that 100 crores of rupees come back and for that, gold has to be given by the Government—100 crores worth of gold may have to be provided by the Government, plus any additional annual demands for currency.

3964. Plus the gold that goes into circulation?—And there may be some economy on the other hand if gold notes are taken. I mean the maximum demand for gold will be 100 crores of rupees which will be displaced by gold according to our estimate plus any normal additional requirements. That is the actual gold required as we started. But the actual amount of gold will be less if the Government succeeds in introducing notes into the circulation at the same time.

3965. With reference to the question of gold in circulation, there is a question which I should have asked you before; let me ask it now. What do you think the effect upon the note circulation would be of the introduction of a gold currency? Do you or do you not think that the result of making gold available for currency would be to drive notes out of circulation?—The scheme, as I have suggested here, contemplates the issue of gold notes as well as gold coins (paragraph 10, Summary of Recommendations), and I say in paragraph 8 that rupee notes of the denomination of ten and five may circulate. So that the rupee notes of smaller denominations only may circulate as substitutes for rupees limited legal tender. Whereas full legal tender notes will be those of gold only which may mean that the existing larger denominations of rupee notes will have to be substituted by gold notes of equivalent value.

3966. I follow that you would provide this additional form of currency, but the point to which I would like to direct your attention is, if and when you give people what, by your hypothesis, is to them the most desirable form of currency, that is gold, will that not lead to their preferring gold for their currency purposes and to their rejecting to some extent notes and thus lead to a reduction of the proportion of the note issue?—I should think on these lines—that even though the people have lost confidence in the existing rupee circulation, still the existing circulation of rupee notes is about 180 crores or more. The people of the country have been accustomed to handle currency notes to this extent in spite of the fact that they know that what they get in exchange are token rupees of fluctuating value. When, however, in future, if this scheme is successfully launched, the people come to realise that the gold notes that they handle are substitutes for real gold which they can get on demand, I do believe that there will be a greater tendency for gold notes to become more popular than the existing rupee notes that we have now.

3967. But there again we are looking forward to the result of a process of education?—Quite so, Sir.

3968. And we are recognising that there will be an initial period during which the reverse effect will make itself felt?—For that we started on the hypothesis that a large number of rupees out of the 300 crores existing—say 200 crores—will still remain and the rupees converted will be those that are in excess. Or it may be that the rupees converted will be by those people in the larger cities, the commercial people and the more educated people who will understand the use of gold and gold notes.

3969. To return to our examination of the manner in which your proposal would work that effect. I want to see, first of all, the effect of the increased requirement of gold. We must take some figure as the basis of discussion, and I think it would be convenient, with a view to the Commission's previous inquiries, if we were to assume that the amount of the additional gold required from first to last to introduce these proposals would be in the nature of 100 million sterling or 130 crores at the present rate. Assuming, if you will for the sake of our argument, that these new uses of gold would require an additional supply for India of 130 crores of gold metal in some form or another, what, in your opinion, would be the effect of that upon world gold prices?—Even apart from such a demand for gold on the part of India, normally India has been importing large quantities of gold.

3970. Let us be quite clear that it is in addition to the normal absorption of gold which is going on at present?—I should say, Sir, that some of the normal inflow of gold into the country or perhaps the greater portion of it will be available or presented to the Government for purposes of coinage. These things will be overlapping. At present the gold which comes into the country is either turned into ornaments or hoarded because it is not possible to use them for currency. As soon as it is known that the currency use of such gold is possible, the ordinary normal imports of gold will certainly be presented to the Government at the mints for purposes of coinage.

3971. Is that quite consistent with what you tell us? You tell us that you do not expect the educative effect of the introduction of the gold standard to be immediate but that you look to a period of transition during which it might well be that the result of the introduction of gold currency would be actually to increase the requirements of the people for ornaments and hoards. If that be so, if you are right in that expectation, will it not be prudent to expect that the present normal demand for gold, for whatever purposes it is used, not currency, would at first be diminished?—I should put it this way, that the demand for the conversion of rupees into gold, of rupees which are scattered all over the country in small quantities, in the hoards or pockets

of various small people, will be presented somehow in course of time for conversion into gold to the extent of 100 crores. The gold which comes into the market for those 100 crores, those poorer classes of people will get in return even if they want to hoard it. But the gold which comes into the country from year to year is in the first place imported by exchange Banks or bullion dealers or by the Government in some cases, and it goes to commercial men who will be more intelligent on the spot in cities like Bombay and will understand the uses of it. On the one hand, the hoarding requirements if there be any will be satisfied by one procedure and the imported gold will be possible to be used in this manner, and I do not think there is any inconsistency in my position.

3972. Your present contention is that the figure for the gold would be reduced in that manner. Nevertheless, agreeing that it is some large figure as to the further requirements of India for gold, would you care to express any opinion as to what effect on the gold prices of the world at large a demand of the magnitude to which I have referred would have?—In tho first place I would start with the remark that even if you say that a large demand for 100 crores of gold will be there, it will not be in any one particular year. The detailed stages which are suggested here tell us that it will be about 5 or 10 yoars; and if tho demand of 100 crores worth of gold is spread over about 10 years, the effect on the gold prices in the world cannot be appreciably great.

3973. At the same time you are taking into consideration no doubt the actual probabilities as regards the future quantities of production of gold in tho world?—Yes.

3974. Aro they in your opinion likely to increase or decrease?—The world demand for gold with reference to its production is less. In the footnote to the Section headed "Effect on Gold and Silver Markets" (Appendices, page 183) I have quoted tho opinion of Professor Cannan. That is a very rocent statement. I have forgotten to give the date but it is 1923.

3975. To which words are you referring at the moment?—The last paragraph: "Thus on the whole there is reason to fear a fall in the value of gold and a rise of general prices rather than the contrary."

3976. You, therefore, are of opinion that, if this demand can be distributed over 10 years, there may be some effect on gold prices. Would you say that there is no importance to be attached to that at all? —There may be some effect on the gold prices but nothing of a serious character of which we need be afraid.

3977. If, on the other hand, those worse possibilities to which I have referred were to occur and the demand were to be concentrated in a very much shorter period, what would your opinion be as to the possible effects of that state of affairs?—If such an emergency did arise—I am assuming it theoretically, I do not believe in the possibility—there would certainly be a greater effect on prices than otherwise and the gold prices would be affected, certainly.

3978. And any other serious disturbances of this sort, I imagine, you would consider to be a matter to be taken into grave consideration from the point of view of the interest of India herself?—I look at it from the other point of view. On the introduction of any sound system of currency for any country whatsoever, there will always be some troubles and some cost in introducing it because it will be somewhat of an experimental nature; it will be difficult to prophesy what is going to happen, and some risk will have to be taken if we want a sound currency system, and I for one am prepared to take the risk of the emergency which you point out, in view moreover of the fact that the world demand for gold with reference to the supply is not great.

3979. You outline the manner in which you propose to attract this additional gold that is required. It is based upon borrowing?—Borrowing is the ultimate stage.

3980. If you work out the intermediate stages, in fact you are borrowing credits against which you draw gold, though it does not appear like that on the surface. If you get the thing down to what is actually happening under the method you propose, you are borrowing credits in a gold centre against which in one form or another you are drawing gold to the country, and if you did not get those credits, you could not force the extra import of gold?—Quite so.

3981. Now I want to clear up what you say here as regards the effect on the gold and silver markets (Appendices, page 183). You say: "India has every right to reform her currency, and the other countries are strong enough to manage their own affairs if they are adversely affected by the action of this country"; and, further on, "if now India asserts her right to have gold for the precious exports which she sends abroad, it is nobody's business to interfere." One might entirely agree with those sentiments and yet find there was another aspect to be considered. Will you assume with me for the moment that other countries might make up their minds that they did not want to part with gold to India. That is what you are really contemplating here?—I am prepared to make that assumption.

3982. They might say, we do not see why we should part with gold, which gives us various advantages in exercising power in the money markets, in order to let India have a gold currency. If that was so, supposing they took that attitude, granting that it might be quite unreasonable, nevertheless how could India enforce her demand against their reluctance, since, if I may point out the point of my question, we have already agreed that her capacity to draw gold to this country must depend upon her obtaining credits at a foreign centre?—The first step would be duo to tho excess of exports. We are getting gold of course for our excess of exports; and in the last alternative, if the excess of exports is not adequate, I think I said that borrowing or external credits would bo the last alternative.

3983. You will agree with me that your method of drawing gold to this country is ultimately based upon your obtaining additional credits in excess of the total exports of the country; otherwise there is no point in it?—If we come to the last stage when that becomes necessary, it will certainly have to be resorted to.

3984. What I want to ascertain from you is, making these assumptions, supposing that there is a reluctance on the part of the possessors of the world's gold to let India have it, how could India force it when her capacity to get it depends on her being able to raise additional credits?—If that last stage has to be resorted to, there is no question of force on the part of India: it will be a question of diplomatic negotiations. During the war period, for example, we got large amounts of silver from America by negotiations; and it would certainly be possible by arrangements with the big holders of gold, the Bank of England or the Federal Reserve Board, to give us the necessary "credits." A system of negotiations or friendly arrangements by which the gold may come to us may be divided and I do not think that is impossible.

3985. That is rejecting my assumption that the Federal Reserve Board is unwilling to let you have gold. You cannot conceal from the Board that these credits are required for the purpose of increasing India's gold supply. If she made up her mind that she did not want to give you that gold, there is no method of compelling her to give credits?—There is no method by which you could compel any foreign power.

3986. Turning then to the topic raised by you, one may be really dealing with practical difficulties and not merely with the assertion of a right. You may be prepared to assert your right, but nevertheless one might be up against a practical impossibility?—I think the subsequent paragraph if read

along with the preceding paragraph will make the point clear. There I point out: "Proposals for the establishment of a gold standard with a gold currency in India were made on several occasions before this," since 1864, from various authoritative sources and on many an occasion. Somehow those proposals were turned out because there were certain vested interests. It is that historical complaint which I am making in the second paragraph that it was not right for those who were in power then not to part with their gold as they did in the past, and their attitude was as unreasonable as that of the Federal Reserve Board would be under the supposition you are making just now.

3987. That is a question on the merits; my last two questions were really, assuming the merits, what means there were of enforcing them?—We have no means of enforcing it; the only means are negotiation. That is perfectly clear.

3988. Now to complete the picture, what in your opinion would be the effect upon the silver market? The figures are these. There is the 100 crores coming back from the outstanding rupees and there is the 90 crores in the reserve, so that we are dealing with something of the order of about 200 crores of silver. That comes on to the silver market. Might that also be increased in your opinion or not by the selling of silver held as stores of value in the form not of rupees but of ornaments or other forms of treasure?—It will not be very great; it may be a little; it may be increased to a very slight extent.

3989. We must reckon upon the possibility of some increase but not, in your opinion, a great increase?—Yes.

3990. Passing then to our ascertained figure of 200 crores, what is your proposal? How would you propose to deal with the 200 crores of silver which will be liquidated?—It will have to be melted and sold over a series of years. In the paragraph headed "Sale of Silver" (Appendices, page 183), I suggest how the sale of silver will involve the Government in a loss; first because the rupees are tokens and second because it may have a depressing effect on the silver markets. The first loss is quite definite and obvious.

3991. Have you been able to estimate at all how much on an average will be realised by the sale of this silver?—If the sale of these large stocks of silver is spread out over the transition period, say ten years with which we start, it would mean about 20 crores a year.

3992. For the purposes of your calculation, have you made any rough approximation as to what you think would be realised by this silver?—I have not made a calculation; but I am prepared to hazard a guess. The present price is about 33 pence per ounce. If the 20 crores of rupees are melted into silver, it would be less because it is a token coin. Really we will be putting on the market silver worth 12 or 13 crores at the most. Now if the 20 crores worth of rupees are melted, the silver bullion would be much less. I am giving the figures approximately. Now if you put that amount of silver on the market you will get only 12 or 13 crores. The depressing effect on the silver market need not be very great. It may be to a certain extent, of course. We shall be realising instead of 33, 30 or 28d.

3993. You say it will not be very great? If my memory serves me rightly, the actual amount of silver bullion which you will be selling is three times the total world sale in one year?—That would be the total sale, not in one year.

3994. You will be selling three times the total production for one year. Realising that one has to deal with an amount of that magnitude, do you think it is safe to assume that the effect upon the silver market would be slight, when you are selling three years' production?—The loss in selling the silver is there in any case. But the question is how to minimise the loss.

3995. You are considering what the effect upon the ruling price of silver would be?—In selling the silver, Government may be given discretion and full discretion with reference to the condition of the silver market from time to time over these series of years and I think the loss can be minimised.

3996. The longer they hold and the longer they spread the sale, the more they are losing by keeping idle a thing of value?—That may be considered to be one of the items in the cost of introducing gold standard and gold currency.

3997. Are you prepared to express any opinion as to what effect this would have upon the silver markets of the world?—I am prepared to say generally that the effect will be there; but it will not be of a very serious character. I am not certainly well conversant with the silver markets to say what it would be exactly.

3998. That requires a very intimate knowledge of a very specialised market, does it not?—Yes.

3999. Let me turn now to the cost of this scheme. Have you made any investigation as to what the cost of introducing your scheme, first and last, would be?—The first item, as I have just hinted, would be the loss on the sale of silver. If you have to melt and sell so much silver, which is nominally worth 200 crores, and if we have some substantial loss, that will be the first important loss. The second big item would be the external credit, so much additional debt and the consequent interest charges. The third item may be what you just now suggested, namely, the loss of interest on the holding of large stocks of silver, locking them and not investing them or not being able to invest them. It is very difficult to give exact figures for one in my position.

4000. I wonder if you could expand your answer a little as to what the actual loss would be. I am considering now the loss in the accounts of the Government of India on the introduction of this scheme. Do you mean that you would take the difference between the token value and the bullion value of the rupee as a dead loss to the Government?—In the Government accounts they have 200 crores of rupees, roughly. If they are to be melted and sold and they get some loss, that will have to be written off. As against this, of course, the Government has got the gold standard reserve which has been built out of the coinage of rupees.

4001. And the further elements?—They are the external credit and the consequent interest charges.

4002. As a result of this method of calculating the cost, have you been able to arrive at an estimate as to what the scheme would cost?—I am sorry I was not able to make exact estimates.

4003. The cost of any scheme is a very material consideration, is it not, as to whether it is desirable and to be recommended?—I quite appreciate that contention, Sir. My position has been that the general lines which I have suggested might be adopted.

4004. You would not go so far as to say that such a change would be worth making at any cost?—I do not say that. I have tried to suggest a balance of advantages, and I have laid down that there would be some cost; but it will be within manageable limits.

4005. Let me put it to you in this way, what will be the utmost you will be prepared to pay for the introduction of a full gold standard?—Even if our public debt increases by 50 crores of rupees or even a little more, I do not think it would be a serious matter.

4006. The public debt would be increased by 50 crores; that is, a capital increase?—Yes, there would be an annual recurring charge of a few crores of rupees on account of loss of interest.

4007. A few crores?—I am assuming it will be about 2 or 3 crores.

4008. A capital increase of 50 crores would mean an annual charge of about 2½ crores, and then you are contemplating some other charge which you spoke of as 2 or 3 crores?—I included in the annual charge the interest on the capital debt.

4009. So that you mean that your answer to the more general question is that you are prepared to pay 2 to 3 crores?—Yes.

4010. And you think the country would get value for the money?—More than the value.

4011. It will be more than worth while to get this gold currency at that cost?—Yes.

4012. The concluding questions I have to ask are as to the ratio at which you think it is desirable to fix the rupee. Here I have some little difficulty in apprehending the proposal. You recommend, in the first place, the minting and the circulation as a gold coin of the mohur, a mohur to be equal in weight and fineness to the sovereign. I should ask you on this point what you consider to be the advantages of the mohur as against the sovereign for the purposes of circulation?—The only difficulty with reference to the sovereign which I have pointed out is that of minting it in India. There have been difficulties in the past in connection with the minting of sovereigns.

4013. The minting of a sovereign in India requires the presence of a branch of the Royal Mint. Are you of opinion that that is an unworkable arrangement or one that is likely to cause difficulties?—I can only look back to the history. When proposals were made in the past, in 1900 for instituting a gold mint and for minting the sovereign as recommended by the Fowler Committee, difficulties raised by the Royal Mint or the Treasury, whichever it is I don't remember, came in the way.

4014. A branch of the Royal Mint was actually in operation in Bombay?—Yes, temporarily during the war.

4015. Supposing it to be the case that it was worked smoothly and without friction, what would be your objection?—I would modify it in this way. When in 1918 the coinage of gold on account of war conditions was thought necessary, perhaps Government approached the authorities in England to constitute an Indian mint as a branch of the Royal Mint. But I believe negotiations were delayed or took more time than required. It was an emergency situation here, and the Government had to coin the mohur before the necessary sanction was got and mohurs in large quantities were coined. Subsequently the sanction was received and the sovereigns were coined.

4016. Those difficulties to which you refer relate to the difficulty of getting the mint started. Once a branch of the Royal Mint is started here, do you then look upon it as an arrangement which is likely to cause recurring difficulties?—It will depend upon the nature of the arrangement between the two authorities. If the Indian mint is more or less independent for its own purpose and if the mutual arrangement between the Indian and English authorities there is a possibility of smooth working, then there is no objection in principle to having a sovereign.

4017. That is the negative disadvantage of the sovereign. What are the positive advantages in favour of the gold mohur? Will you direct your mind in replying to that question to the possibility of the gold mohur not being so widely known or relied upon as the sovereign which is familiar, particularly in the Punjab and elsewhere?—I should believe that both the coins, mohur and the sovereign, are familiar. Before the sovereign was thought of in 1899 and before it was declared legal tender in our country, mohurs were coined and were in existence till 1893, when the mints were closed to the free coinage of silver and they were also by the same Act closed to the free coinage of gold. But till then the Indian mints were coining gold and gold mohurs freely, though gold coins were not legal tender in the country, so that the people are accustomed to the gold mohur even as they are in recent years accustomed to the sovereign. The only objection is that of minting. It may be that in some parts a particular coin is more familiar than the other; but if they are of the same weight and fineness, I do not think there will be any difficulty.

4018. The mohur might be familiar in historic times; but was it not changed in recent times?—In 1918, when gold coins were coined, the number of mohurs coined were larger than the number of sovereigns coined. In 1918, during that temporary war measure, the public did not have many opportunities of acquainting themselves with any of those gold coins. From what I remember of the history of the period, I think their career was a very brief one.

4019. Now coming to the question of ratio, you recommend the adoption of a ratio of 15, that is what is commonly called the 1s. 4d. rupee, though you would not prefer that phrase with reference to your standard. Will you please explain what precisely you contemplate. Under the heading "Rate of Internal Exchange" (Appendices, page 184) you say, "Besides it is not likely to do any harm which the opponents of this ratio may point out, because the supposed harm is with reference to the external value of the rupee, which is no longer required to be considered." By fixing formally the stable value of the rupee as one-fifteenth of a mohur, which is equivalent to a sovereign, does one eliminate all the consequences of a change in the gold value of the rupee from its present estimation of 1s. 6d.?—When this would be in operation, when the full gold standard has been established, if you take the analogy of England, the rupee, when it is declared a limited legal tender, will have a position similar to that of the shilling in England. The shilling is rated for internal purposes with the sovereign or sterling as one-twentieth and the people of England have been accustomed to it. It is a mere matter of convenience to rate the subsidiary token coin with the unit of currency at any convenient ratio. It is a matter of convenience more than of principle.

4020. This is perhaps an immaterial point that I am going to refer to now. That is so, no doubt, but it will be many a long day before prices and rates of exchange are quoted in mohurs?—I should think on the other hand as soon as it is announced that the gold standard is decided upon and definite stages are being worked out, the commercial public and the exchange banks who deal in this business will of course turn their calculations in the right direction.

4021. The relevant point here is that the gold value of the rupee at present stands at the 1s. 6d. rate. You propose that the gold value of the rupee should be changed to the 1s. 4d. rate?—Yes, Sir.

4022. That involves, does it not, certain readjustments?—During the transition period?

4023. Yes?—The rupee so long as it is not declared limited legal tender, in other words, so long as it is unlimited, the market rate will have to be respected. It will be very difficult, it will involve another process if the rate has to be changed. On the one hand during the stages of the introduction of the gold standard, there will be one set of difficulties for Government. On the other hand, the rupee will have to be left as it is for some time. But as soon as it is declared limited legal tender, it loses that importance for external purposes.

4024. What is your view regarding the immediate future? I understand that the situation is to be dealt with at once by the Government undertaking, through the Imperial Bank, to buy and sell gold according to the par of exchange. What in your recommendation is the par of exchange which should be adopted forthwith? Are you in favour of retaining the present market rate of the 18 penny rupee or taking steps to readjust matters so that the rupee should stand at the rate of 1s. 4d.?—In the introduction of the gold standard during the early stage on the one hand if efforts are made to reduce the rate to 1s. 4d. it may defeat the purpose of the gold standard. . If the rupee is to be reduced to 1s. 4d. it will involve some additions to the currency and the gold standard measures will be fighting against the volume of rupee currency. One should not therefore expect to see rupee currency rising in volume at the time when we want to reduce it. From that point of view I would let alone the 1s. 6d. ratio as it is, provided these measures are right away started.

4025. But would you not take any immediate measures to alter the rate of the rupee?—No, Sir.

4026. Then I do not quite follow why you recommend that ultimately it should be fixed at 15 to 1. Supposing the rupee went on as it is, successfully stabilised by the operation of the machinery to which you refer here, its value is kept stable at 18 pence. How would you eventually effect the transition from the 13 and one-third ratio to the 15 ratio?—The only argument in favour of the 1s. 4d. ratio is that it is popular because the people are accustomed to it. There is no objection in principle to having any ratio either 2s. or 1s. 8d. as soon as the rupee becomes limited legal tender.

4027. Supposing when you finally take the step to which you refer of limiting the rupee as legal tender, you limit the rupee as legal tender, and, after giving rupees against gold, supposing then the happy state of affairs still continues which you are contemplating, that is, a stable rupee at 1s. 4d. continues up to that point, you would then take steps to adjust the ratio from 1s. 6d. to 1s. 4d., because we must recognise that it will not get there of its own accord, if the stabilisation scheme is effected. Let me put my question to you in a shorter way. Supposing that the rupee continues stable at 18 pence until the time comes for the limitation of the rupee as legal tender, would you then at that period fix the number of rupees in the sovereign or mohur at 15?—In principle I start with the proposition, if I may repeat it again, that there is no objection to fixing the rupee when it is limited legal tender at any rate, and therefore if the 1s. 6d. rate is familiar, if the people have got themselves accustomed to the 1s. 6d. rate after the successful introduction of the gold standard and the stage has arrived when the rupee is made limited legal tender, I do not object to the ratio being 1s. 6d. or any other.

4028. I think the immediate consideration for the information of the Commission is that you do not immediately propose taking any steps to effect, by additions to the currency or otherwise, an alteration in the present current rate?—On the supposition that the gold standard is being introduced.

4029. On the supposition that an exchange standard is continued, to explore your opinions in all their alternatives what would you say then as to the rate?—In that case under an exchange standard the external value of the rupee will have an important place in our consideration and the imports and exports of the country will be affected and prices will be affected by either rate.

4030. What conclusion would you draw from that?—My conclusion is that we should revert to the 1s. 4d. rate.

4031. Let us examine that position and ascertain what your contentions are there. On what principal grounds do you base the desire for a 1s. 4d. rate in contrast with the 1s. 6d. rate under those conditions?—The main ground is that we are more an exporting country than an importing country. The volume of exports being larger than the volume of imports, with the 1s. 4d. ratio the people of the country are likely to be at an advantage.

4032. Is it your opinion that the export trade is permanently benefited by a lower absolute rate of exchange than by a higher rate?—I was going to support that position by a second position. If the gold exchange standard is to be maintained at particular rates, the rupee stabilised at a particular rate, then in addition to the advantage to the export trade the question of the Government being able to maintain the rupee at a particular point is also to be considered. In a country like ours——

4033. Just before we go on to that, I rather gathered from your previous answer it was your opinion that a stable 1s. 4d. rate would permanently benefit the export trade more than a stable 1s. 6d. rate?—Yes, generally speaking.

4034. That is your opinion. Now let us pass to the answer I am afraid I interrupted you in giving just now?—In a country like ours where there is a possibility of famines, when we have scarcity and famine, our normal exports will be affected, and it is during these times of an adverse balance of trade that the Government has to use its resources to maintain the exchange value of the rupee. If the rate is fixed up at a high rate, 1s. 6d., higher than the pre-war normal rate, then the difficulties of maintaining the rupee are greater than the difficulties in the other case. In times of adverse balances you will agree, Sir, that the tendency will be for the rate further to be depressed, to go down, and if the rate of exchange is fixed at a higher level, the resources which the Government of India will have to employ to maintain the exchange will be greater than with the rate at 1s. 4d. So from the practical point of view of the Government's own resources the Government themselves being able to maintain a rate under the gold exchange standard system, I should prefer the 1s. 4d. rate.

4035. To summarise that reply, I understand it is further your opinion that, as between two stable rates, the Government of India will find it easier to maintain a lower stable rate rather than a higher one?—Yes.

4036. By what measures would you secure the reduction of the rate from 1s. 6d. to 1s. 4d.?—Under the gold exchange standard?

4037. Yes, all our questions are now proceeding on that assumption?—I have necessarily to differentiate between the two because I believe in the other system. The only method to-day is to increase the volume of currency in a suitable manner.

4038. What reactions would the increase in the volume of the currency, which will no doubt make its effect felt upon prices, have upon the trade and industry and upon the people of the country at large, taking them in their relevant aspect in this connection as debtor and as creditor?—The first effect will be that the prices will rise to that extent, to the extent that the Government succeeds in reverting to the 1s. 4d. rate; but as I stated in the beginning a somewhat higher level of prices is beneficial to the country, we being interested more in large volumes of exports than imports. Imports will be dearer to that extent, but we shall be benefiting the exports of the country, and our exports are mostly raw materials and food-stuffs, agricultural products; and our population which is also mainly agricultural will therefore be benefited. On the whole, therefore, the greater proportion of the population will stand to gain by the 1s. 4d. ratio in spite of the fact that there will be some amount of increase in prices.

4039. Very crudely put, the increase in prices may benefit sellers but it must be to the detriment of buyers?—Quite so.

4040. What makes you prefer the benefit to the seller rather than the detriment to the buyer?—There is one feature of our economic life which I may point out. Let us take the large masses of the people in the interior, in the villages and districts. Even if an agriculturist is growing, say a thing like cotton which he necessarily is interested in selling, as a rule we find the same agriculturist in some other fields or in some part of his holding growing some food-stuffs just enough at least for his own maintenance and his family; and we find therefore in the large majority of cases food-stuffs and other materials of immediate necessity and the daily requirements are grown by the agriculturists on their own fields for their own consumption and not for buying and selling. If there is a surplus of course they would sell it, but not otherwise; so that the higher level of prices which would come into existence will not affect these parties; in other words I mean the large mass of the people are more interested in selling their goods than in buying; and as sellers of course they will benefit.

4041. Let us recognise of course that there is a primitive community, if you can imagine a perfectly primitive household that produces the whole of what it needs on its own farm?—I did not say that this was so in a particular case; it is there in very many cases.

4042. I just want to analyse that a little. In the first place you can consider a perfectly primitive

household that produces the whole of its own requirements from its own farm. That, in its happy state of nature, is not affected by prices at all?—Yes.

4043. Then you have the other community in which part of the produce is sold and money is received for what is sold. That money represents the value, which is used again in the purchase of something else. What permanent difference does it make to such a household when prices rise or fall, since adjustments have taken place, if we consider that, although it gets more or less for what it sells, in proportion it can buy more or less?—If we had such a state of affairs when all the millions of households in this country, agriculturists, chiefly, were in that category which economists would call money economy in its ordinary sense, then this difference would not exist. But the country is in a state of society where a large number of people are in the earlier stage—you may call it primitive to a degree; and they are not likely to change materially very soon in the near future. In that state of society they are certainly more interested as sellers than as buyers.

4044. The most primitive stage to which you have referred, where people neither buy nor sell, we can understand; but I still fail to apprehend why, in the further stage to which you have referred, they are more interested in one capacity than in the other. The money they get they want to use again?—In the first place taking the agricultural family, its immediate requirements are as a rule food-stuffs, and their needs are satisfied by the efforts of the household itself, if we take that as a sample. So to that extent the agriculturist does not buy in the market. Of course he has other requirements, luxuries or some other necessaries which he is not able to so supply and to that extent he will be buying in the open market; but his total buying transactions will be less than in the case of any other household which will be dependent only on purchasing its goods and not supplying its necessaries by its own efforts; whereas the surplus goods which a household produces and which it does not consume itself, it will be interested in selling; so on a balance, I believe that the buying transactions will be less than the selling transactions; and of course the surplus which the family receives is stored up or turned into ornaments and so on.

4045. The purchase of ornaments is a purchase like any other?—Quite.

4046. If it is value stored up, it is value for a future purchase?—Yes.

4047. And the interest as regards that store of value is precisely the same as if it was used up for immediate purposes?—I quite see it; there is an offset to that extent; I do not deny it.

4048. I think I may summarise your evidence by saying that, recognising that there are disturbances resulting from an increase of currency necessary to achieve the new ratio, you are nevertheless of opinion that there are permanent benefits to be gained from the establishment of a lower ratio which, in your opinion, are more than offset by the disturbances which would result from getting there?—Yes.

4049. (*Chairman.*) That completes the questions which I wanted to ask you. I have no doubt some of my colleagues have supplementary questions to put.

4050. (*Sir Rajendranath Mookerjee.*) Food is as much a necessity as clothing?—Yes.

4051. The poor man would rather have his clothing first; he could beg his food, but he must have clothing in order to go from door to door, *i.e.*, before he can leave his house; therefore if your exchange benefits the agricultural producer in the country he will have to pay more for his clothes. Which do you consider to be more advantageous to him?—In the first place I would say that though there may be a certain class of people who may prefer the acquisition of dress to the acquisition of food, on the whole I do not accept your premise that people would prefer dress to food.

4052. I will not say prefer; say that they are both equally important; they cannot do without dress?—My answer to the chairman was this: the requirements of an agricultural family may be divided into several classes; the primary requirement of course is food, and the other is clothes. One of the fundamental requirements is met by the efforts of the family itself, for which it has not to enter the market. Of course to the extent to which the family does enter the market to purchase the other requirements it will be affected by the level of prices.

4053. And you admit that by lowering the exchange the other prices will go up, that is, clothing or the other necessaries of life?—Yes; except what is its own produce. The price of food-grains in the bazaar will go up certainly; but the agricultural family depends on its own produce in the field; it does not go into the market because it does not buy there.

4054. He will have to buy other necessaries of life?—To that extent of course he has.

4055. (*Sir Alexander Murray.*) In your statement, under the heading "Remedies" (Appendices, page 180), you quote from Dr. Gregory regarding the effect of the gold standard system. I expect you will also accept Dr. Gregory's statement at page 12 of his book that in "gold exchange standard countries the same effect was achieved, directly, by immediate sale or purchase of the local currency against gold." You give the effect of the gold standard quoting from Dr. Gregory. Dr. Gregory also in the same book says that the same effect is arrived at in gold exchange standard countries as in gold standard countries?—May I have the book for a while?

4056. You quoted from pages 46 and 47; that is exactly on the same subject; he is writing in the same connection?—On page 43 I have quoted a paragraph.

4057. Pages 46 and 47 you quote from?—I am pointing out another place; that is with reference to the whole answer if you do not mind. On page 43 Dr. Gregory describes the existing system in England of the Bank of England buying and selling gold; that is the gold exchange standard system. The system of currency in England at present by which we have full legal tender notes only and gold is bought and sold by the Bank of England is described by Dr. Gregory as the ideal gold exchange standard system. Now, the gold exchange standard with which we are familiar in this country is certainly different. So the meaning that Dr. Gregory had in mind is different from the meaning attaching to the phrase with which we are familiar.

4058. On page 12 he is talking not of England as it exists to-day, but of the gold exchange standard countries as they existed in pre-war days, and he suggests that the same effect was arrived at under the one system as the other?—In the first place, I do believe that the phrase is used by Dr. Gregory with a meaning different from that which we have in mind. In the second place, this statement made by him is subject to the qualification so long as the gold exchange standard system works systematically; if it breaks on account of any defect in the system itself, of course this remark does not hold good.

4059. Similarly, just as the gold exchange standard broke down in some of the countries owing to the war, the gold standard also broke down in other countries?—Of course; that is true of all human institutions.

4060. One of your objections to the gold exchange standard and one of the defects which you refer to in your "Summary of Defects" is the management of the system. To quote again from Dr. Gregory; he says that "the currencies of all commercial countries before the war, even those which were full gold standard countries, were 'managed currencies'"?—I don't object to the fact of a currency being managed. To a certain extent the management will be there under any system of currency; even under the proposed gold standard there will be some amount of management, if not by the Government, by the Imperial Bank on behalf of the Government. But if the management is such, in the first place, that it is understood by the people, in the second place that it has no adverse effects on the condition of the people, and in the third place, that there will be no possibility of misgivings, that is if

the management is in the hands of experts and so on, then there is no objection. In other words, as little management as possible is desired.

4061. Quite true, but you will admit that there is management nowadays under both systems?—Quite so. Management there is, but the less the better.

4062. And, quoting again from Dr. Gregory, "it may be argued that the necessity of facing the possibility of heavy American exports of gold proves that the gold standard in the post-war period is itself a 'managed currency'"?—Again, the answer is the same, Sir, that management does exist in both currencies; it is a question of degree.

4063. That is all I want. One other point. You refer to the fact that immediately after the introduction of a gold standard there will in all likelihood be a rush for gold—tailing off later on as it becomes better understood?—Yes.

4064. Now, in that connection, have you considered what effect the introduction of the gold standard, with or without a gold currency, will have on the question of hoarding? I mean, will the new part to be played in India by gold as a basis for money not give it an increased prestige and increase the demand for its use as ornaments and in the arts, apart from its natural suitability for hoarding?—I think otherwise, Sir. That there will be a great possibility to unhoard the existing hoarded gold in the country if we had the gold standard with gold currency.

4065. The point I want to get at is—does the raising of the prestige of gold as a basis for money in India not add to the attraction that it will have for the people of India for ornaments and crafts? Now, I speak from my own experience in that connection, because I have seen poor people in my time wearing, first of all, shell ornaments, then later on metal ornaments, first brass, then silver, and then gold, and I mean, as you raise the prestige of the metal in the country, will there not be an increased demand for gold in the country for ornaments instead for the silver ornaments which people hitherto have preferred largely because this metal was in the rupees since olden days?—I don't think so, Sir. Those who are at present in a position to acquire gold—of course gold is available in the market though it is not useful as currency—those who are rich enough do use gold ornaments now, it is only these people who will be using gold ornaments in the future and the increased demand for gold for ornamental purposes—I do not see how it could arise.

4066. You do not appreciate the fact that the raising of the prestige of the metal will make any difference in the type of ornaments or the use it is put to?—I should put it the other way. The prestige of gold to-day is raised in a very queer fashion, and if we were to have a gold standard and gold currency—though it seems a contradiction in terms we should be lowering the prestige of gold in India. At present people are hoarding gold because they put it on such a high level as the best store of value better than the existing currency; so that you will be lowering the prestige by allowing people to unhoard their gold and use it as currency. Am I clear, Sir?

4067. Yes, that is one point of view, certainly. One other question. I gather you are of opinion that, if gold is made readily available for exchange into notes, it would give greater confidence to the people?—Yes, Sir.

4068. Now, why should that be? Is it not the case now that notes are accepted not because they are convertible into silver rupees, but because the holders know that all other people will accept them? I mean it has nothing to do in the minds of the common people now, it is of no consequence, whether the reserves are of gold or silver, but the fact that influences the Indian or any other people in accepting notes is the fact that they will be convertible?—Convertible into rupees?

4069. Yes, convertible into currency. Therefore, it is immaterial what the nature of the reserves are against the notes. The people accept the notes simply bcause they know that they can pass them on to somebody else and use them for the purchase of commodities?—And because of the conviction in addition that, if they do not want to purchase the commodities, the note is equivalent to the silver rupees. They could always demand rupees in return for the notes. It is that fact that induces people to accept notes as currency.

4070. And they hoard notes also? Notes are kept up also by the people?—I don't think so, to any large extent. They may do so casually—in the sense in which we hoard some notes in our pockets.

4071. (*Mr. Preston.*) Professor, might I direct your attention to your Summary of Defects, section 4? As a defect you say: "The system will break as soon as the price of silver rises to the rupee melting point." Then in section 6 you say: "A huge token currency of rupees of fluctuating value has come into existence in which the people have lost confidence." Now, is it not a fact that section 4 would be a strengthening factor rather than a defect?—I fail to understand how you mean, Sir.

4072. Let me read it again to you. You quote certain summaries of defects and you say: "The system will break (that is, the gold standard system) will break as soon as the price of silver rises to the rupee melting point." I put this question to you—is that not a strengthening factor rather than a defect?—I have tried to argue in the body of the evidence that it is a defect.

4073. Let me put it this way—that from my point of view, instead of being a defect it is a strengthening factor in the system. I should like to know how. What we are suffering from in the land of India to-day is a redundancy of silver rupees. We do not know what to do with them. And you suggest here that a huge token currency of rupees of fluctuating value has come into existence in which the people have lost confidence. You admit it?—Yes, Sir.

4074. Now, let me assume that silver went to 50 pence, that would be about the point at which we could melt our rupees, and if we could get that consummation which we all desire, what would be easier than to melt down a lot of our rupees at 50 pence and get gold, to the extent of the silver which you could melt down?—My answer to that question is that when I say in section 4 that, when the price of silver rises to the rupee melting point it is a defect, what I mean is that it is a defect in maintaining the gold exchange standard system of which the main function is the maintenance of the external value of the rupee with reference to sterling or gold. During the war, of course, the experience which you suggest, Sir, did arise, and in 1917, as soon as the price of the rupee touched 43 pence and higher, it was perfectly possible for the people in India to melt down rupees and make a profit. But the Government would never allow such a profit to the people. In order to maintain the currency system going, Government has to raise, as it did, the exchange value of the rupee and once again restore the token character of the rupee. So that windfall of profit to the people is not likely to arise, Sir.

4075. But then does not that come within the category of those points which the Chairman brought forward as remedial measures?—But mistake was made with reference to the date which was 1920, February, March and April, if my memory is right. The average price of silver was then about 86; if the Government at that time had simply said: We will not pay 86 pence; we give you absolute freedom. We cancel our bond; sell it for 86 pence. Let me say that is a state of affairs which I don't think any Government in its wisdom would support.

4076. You would not now call it under a new remedial scheme a strengthening factor?—No, Sir.

4077. You still maintain it is a defect?—Yes, Sir.

4078. (*Sir Maneckji Dadabhoy.*) Professor Vakil, I draw your attention to the section of your memorandum headed "Gold Standard in India." You say

therein, that "In India, under present circumstances, the sudden introduction of gold notes as the only full legal tender without gold coins is likely to be misunderstood, and may not succeed. It is obvious, therefore, that for some years to come at least the gold standard in India will require both gold coins and gold notes in circulation." Is it practicable that during the early stages of the introduction of the gold standard we shall be in a position to issue large quantities of gold?—Yes, Sir.

4079. It will be. There would be no difficulty?—Difficulties there will be to some extent in acquiring the necessary quantities of gold, but in the next section headed "Practical difficulties" I have tried to point out what will be the nature of the difficulties and the possible resources.

4080. I have seen that. But it will take some time for the introduction of gold currency?—Yes, Sir. It will have to be spread over a certain number of years and in certain stages, more or less on the lines suggested in the scheme supplied to me.

4081. And it will not be a serious impediment to the introduction of gold?—I do not think so.

4082. Will not the people in the country at the initial stages be dissatisfied with gold notes?—I do not think so.

4083. I mean gold notes without gold coins. If he presents gold notes he will not get the gold against them. That is what we are intending. People will not understand. As you know a gold standard does not necessarily denote gold currency?—Hence I specifically mention that we should have a gold currency.

4084. We should have. And people at the early stages would not be satisfied with purely gold notes in exchange?—They will not be satisfied without gold currency.

4085. Then you stated that we should require—your estimate was about 100 crores in answer to the Chairman—you said we should require 100 crores for conversion purposes?—This amount would take some time to come out.

4086. What period would this 100 crores for conversion be spread over?—About 10 years, as I said in answer to the Chairman.

4087. And it would also be necessary to retain a large number of rupees on hand for the purpose of the convertibility of our note issue?—We already have in the paper currency reserve about 90 crores of rupees, and we shall be getting according to the estimate about 100 crores for conversion; that is about 200 crores probably in the course of these ten years, and the idea under discussion was to sell gradually these stocks of silver to turn into gold so that during the period when this process was going on, there would be sufficient stocks of silver on hand.

4088. Will you please tell us what economic effect this huge dislodgment of silver, this huge release of silver, would have on the internal prices?—It will have no appreciable effect on the internal prices of the country because we start on the supposition that the unit of price will be the gold coin. As soon as we have the gold standard and gold currency, our unit, as I suggested, would be the gold mohur. The rupee is to be a limited legal tender, a subsidiary coin, a mere matter of convenience as the shilling in England is, for internal purposes. Though people deal in shillings for small transactions, the internal level of prices is not affected by the volume of the shilling currency. It is the sterling which is the unit for the settlement of transactions, and it is the volume of the sterling currency which affects prices in either direction; in a similar fashion if we have a gold standard with a gold currency, the unit of our currency being the gold mohur, say, both internal and external prices and our export and import transactions will be settled through the medium of the gold coin, the mohur; the rupee will be limited legal tender, reduced to a subsidiary token position, and it will have no effect on the level of prices. During the transition period it may have some effect, but that is worth risking.

4089. It is not likely to have any effect on wages?—Yes, not likely.

4090. In your opinion the price of 50 crores of rupees, the premium which we have to pay for the introduction of this standard, is not high?—Yes, not high.

4091. We have to remember that this increase to the national debt to the extent of 50 crores will, I understand, be spread over a fixed number of years?—During the time that we have to raise external credits, it will not be all 50 crores in a year.

4092. How many years?—During the first 10 years.

4093. The necessity for raising credits will arise when our existing resources for gold are exhausted?—Yes.

4094. And this extra charge on the revenues of India, I understand, will have to be met by temporary taxation?—If there is a retrenchment in the national finance, if the Government of India finances are in a position to meet this extra charge, well and good; if not, I am prepared to have additional taxation for the purpose.

4095. You would even go to the extent of additional taxation for the purpose of introducing this scheme?—Yes.

4096. Your conclusions in answer to our learned Chairman regarding the ratio to my mind are very important, and I want to know exactly if I have understood them correctly. You in the first instance argue that if a gold standard is to be introduced, you would continue to keep the ratio to 1s. 6d. provided the rupee is to be a limited legal tender. That is the first conclusion. The second conclusion you have drawn is that if the gold exchange standard is to be kept, we must necessarily revert back to 1s. 4d.?—Yes.

4097. And between two stable ratios the Government will find it more convenient to maintain the lower rate?—Yes.

4098. There is one more question. In the summary of your recommendations, clause (3) you have said that a "separate gold coin, called the mohur, of the same weight and fineness as the sovereign be issued by the Indian mints." Then you want something equivalent in value to a sovereign?—Practically the same, excepting the name.

4099. (*Sir Maneckji Dadabhoy.*) I may tell you that we had two opinions before us; one was that we should have an actual gold coin of Rs. 10, another was that we should have a gold coin of Rs. 20. Are there any special reasons for preferring an Indian gold coin equivalent to the value of the sovereign?

4100. (*Chairman.*) The principal reason given by the witness before was that having a sovereign entails having a branch of the Royal Mint. The Professor thought that it was undesirable, so that does away with the sovereign question.

4101. (*Sir Maneckji Dadabhoy.*) My question is slightly different. Why do you think it necessary to keep up a coin equivalent in value?—The sovereign was declared legal tender in 1899, and we have been seeing it. People are familiar with the use of the sovereign. We have been accustomed to the 15 rupee gold coin for so many years as against any other denomination, say, a Rs. 10 or Rs. 20 coin; because we are accustomed to the 15-rupee coin, I should prefer it to any other denomination.

4102. In other words, people have got accustomed to the Rs. 15 coin, and it would be much better to keep up the tradition?—Quite, and we had the mohur also of the same weight and fineness. This would be more in consonance with the wishes and habits and conditions of life of the people, and it would be better to continue it.

4103. (*Sir Henry Strakosch.*) With reference to the statement you made regarding the rate of stabilization, you stated that it would be necessary to stabilize at 1s. 4d. in case a gold exchange standard is introduced, and that it would not matter very much at what point you would stabilize in the case of a gold standard. I do not quite appreciate why it

should be necessary in the one case to come to 1s. 4d. and in the other case to choose?—The reasons which I gave to the Chairman I may repeat. When we have the gold standard, the rupee becomes a limited legal tender, a subsidiary coin. It loses all its importance which it certainly has under an exchange standard. Under the gold exchange standard system the rupee remains and retains all its present position as the main unit of our currency and the unit of our transactions, and chiefly of our export and import trade. All our transactions are measured in rupees under the existing gold exchange standard system, and will be so measured if the system is continued, so that the effect of a higher or a lower exchange and any change in the level of prices measured in rupees will have to be taken into consideration if we have the gold exchange standard system continued. On that ground I suggest that it is better for us to have the 1s. 4d. ratio, firstly, because of the interest of the people of India; secondly, because it is more possible for the Government of India to maintain that rate. When I spoke of the gold standard with the rupee as limited legal tender, reducing the rupee to the very subsidiary position of a mere token, not affecting the level of prices, not affecting all transactions but a mere matter of convenience, it does not matter, I believe, in principle at what rate we keep the rupee with reference to gold. The question of rate, which is certainly very important, the most important when we have the exchange standard restored, almost disappears when we have the gold standard.

4104. But is there any reason why you should not stop the further coinage of rupees under a gold exchange standard or in fact even make them limited legal tender?—I understand under the gold exchange standard system even under the proposed scheme, the rupee remains unlimited legal tender.

4105. But if for argument's sake we were to stop the further coinage of rupees, would you still say that it is necessary to go down to 1s. 4d.?—So long as the rupee remains unlimited legal tender and the chief unit of currency, I would prefer 1s. 4d.

4106. Now let us go further. If you retain it as unlimited legal tender, and if you regard it in other words as a note printed on silver, then, as long as you have provided adequate reserves of foreign currency or gold for export, you will be in no different position to a system where you have an extensive issue of notes printed on paper?—That does mean that we shall require more rupees, and is an additional ground that we shall be required to coin more rupees.

4107. If the rupee takes up the position of a silver note with the necessary provision for conversion as you suggest—I believe I understand you aright—then just as we require additional note currency, paper currency, similarly, additions to that silver currency will also be necessary, and if you make the necessary provision for reserves, I see no reason why it should not function in exactly the same way as the full gold standard?—I have discussed in detail some of the defects which can be remedied by an improved gold exchange standard, but not all.

4108. But that particular defect can be remedied provided you keep adequate reserves both against your notes and your notes printed on silver?—I agree to that.

4109. And therefore in those circumstances you would see no insuperable difficulty in fixing upon a rate which need not necessarily be 1s. 4d.?—What I pointed out in answer to the Chairman was this, that in order to maintain the exchange rate at any particular figure to provide for emergencies, the Government would be required to have certain reserves. Those reserves may be less with the 1s. 4d. rate than with the 1s. 6d. rate. The strain on the reserves would be larger with a 1s. 6d. rate. I started on the assumption that we were liable to famines in this country. They are a frequent occurrence and they bring about an adverse balance of trade, less exports, that is an adverse balance of trade. In such emergencies, when the people in the country are in difficulties against which the Government has to provide by means of famine insurance schemes, the reserves of the Government are already strained to relieve famine-stricken districts. At that time if the Government is required to have very large resources to maintain the rupee at 1s. 6d. it would be more difficult for them to do so. If it is at 1s. 4d., then the strain would be less.

4110. I cannot quite appreciate the point. If I may put it to you this way, if you were to choose the 1s. 4d. rate, then obviously prices would rise; if the internal prices have adjusted themselves to-day to the 1s. 6d. rupee, internal prices would have to rise to adjust themselves to the 1s. 4d. rupee and a larger amount of additional currency will be in circulation. Well, why in these circumstances should it be more difficult for the Government to maintain a 1s. 6d. rupee than a 1s. 4d. rupee? If you look at it from the point of view of the adverse balance of trade or look at it from the point of view of the contractibility of the currency, you get to the same result. If in the one case you are able without undue inconvenience to contract your circulation by 25 per cent. and that is the measure of your requirements for external payments, the 25 per cent in the one case will be the same amount as the 25 per cent. in the other case?—I should give you an illustration. The difficulty will be somewhat of this nature. The Government of India did experience it when they adopted the 2s. rate. They could not maintain the 2s. rate in spite of their sales of 55 crores worth of reverse councils and they had to abandon the effort. If the rate had been fixed during those dates at a lower level, say at 1s. 4d., it would have been possible for the Government to maintain it and not allow the exchange rate to drift as it was the case. Some such similar difficulty I apprehend if our rate is higher than the pre-war normal.

4111. But was that difficulty of the 2s. rupee rate not due to the fact that world gold prices had been particularly unstable and unduly high? And if world prices had reached an equilibrium, that danger would not, I take it, have occurred?—I certainly admit the proposition that there are always several factors affecting these questions. But I do believe that to the extent to which the rate is higher there is greater amount of difficulty on the part of Government to maintain it. It is not difficult to maintain it. In fact, the Government has maintained it for so many months. But I am trying to balance the advantages in all directions, and I do feel that on the grounds I have mentioned, 1s. 4d. rate is practicable and maintainable.

4112. Now we must anticipate that the prospective sale of a large quantity of silver will to a greater or lesser extent affect the silver price. Now what effect or repercussion would a fall in the price of silver have upon India? Having regard to the fact that, especially in the East, a great many countries are silver-currency countries, do you anticipate any repercussion from that course?—Not very great. Our trade is more with gold-using countries than with silver-using countries. The trade with China, for example, is much less as compared with the trade that we have with gold-using countries, especially England, America and Japan; so that if there is any trouble arising on that score, it will be somewhat insignificant compared to the advantages of having a gold standard.

4113. Coming to another subject. In measuring the advantages of the one or the other, we have really got to consider what benefits we are to get from the adoption of one or the other. You told us that the ideal to be aimed at was the establishment of a true gold exchange standard, inconvertible notes internally and convertible only for export purposes on the principle that gold is international money which ought to be used for international purposes. That is your end aim?—Yes.

4114. But you propose, before you reach that end aim, to adopt a full gold standard with gold currency in the country for the one supreme purpose, namely, to educate the people to saving in things other than precious metals. Is that so?—I beg your pardon. I could not catch the last sentence.

4115. Your proposal to introduce the gold standard is made with the object of hastening the process of education in the country to invest savings in things other than precious metals?—Yes. I do not mind if the process takes a long time, that is, if that particular process takes a long time.

4116. But that is the object?—Yes.

4117. That is the primary object of introducing a gold standard?—Yes.

4118. Now we have had evidence before us which indicated that you could proceed on this educational campaign by other methods, and the evidence of those people was supported by the fact that in recent years not only has the note issue very largely increased, but the issue of cash certificates also, indicating, in other words, that the people are beginning to learn to put their savings into things other than precious metals. Now if you are to weigh which road you are going to take, is it not logical, or would you condemn it, to first choose the road that is least likely to cause disturbance and is least costly, and would you not therefore say that it is a reasonable proposition to first try the gold exchange standard for that educational purpose, and, when you have failed in educating the people under the gold exchange standard, to then adopt the gold standard?—If I may be permitted to say, we have already tried the gold exchange standard for a sufficiently long number of years and failed. That is my first proposition.

4119. When have you had the gold exchange standard in this country?—The gold exchange standard as it is popularly described; never mind the correct name.

4120. But it was not a gold exchange standard. Under the system which prevailed in this country before the war, you could not get gold on tendering rupees. That is not gold exchange standard at all?—I am sorry if I am misled by the Chamberlain Commission in calling it so.

4121. What is commonly called the gold exchange standard is, as I have said before, an internally inconvertible currency but freely convertible for export purposes?—The system as it exists in England.

4122. (*Chairman.*) The Chamberlain Commission recognised that it was different from the gold exchange standard in lacking that legal liability?—Unfortunately our system has been popularly described as being a gold exchange standard one and the ideal gold exchange standard system the system working in England at present being called gold exchange standard is substantially different from our system. There we are in agreement.

4123. (*Sir Henry Strakosch.*) But then India has not hitherto tried the real full-fledged gold exchange standard?—My point, Sir, is that we should better try an experiment which has been tried successfully elsewhere. The people of England have arrived at this present position of what you call the ideal gold exchange standard after having gold standard and gold currency, the full gold standard for more than a hundred years. We had better go on safer lines, lines of which we know sufficiently, rather than with an untried gold exchange standard about which we have already some misgivings.

4124. Even though the introduction of that system is full of uncertainties, because we have to deal with factors that are practically unknown in introducing the gold standard, and even though there are dangers in that, the expenses would be far greater, and it is conceivable that it may cause disturbance in world gold prices and therefore hit India as much as the rest of the world. Would you nevertheless recommend that the first attempt to educate public opinion in India should be in that perhaps more hazardous way?—In spite of the frightening picture that you give of the gold standard, I still favour it.

4125. You seem to have some misgivings as to the virtues of the gold exchange standard. May I ask you whether you have followed the proceedings at the Genoa Conference, and whether you know the resolutions which were passed there?—I know in a general way. I don't think I remember everything. But I think I quite follow you.

4126. But you do agree that what the Genoa Conference proposed unanimously was the universal adoption of the gold exchange standard?—In the sense in which England has it?

4127. Yes?—Yes; that, of course, is our ideal in the suggestions I make.

4128. So there are no misgivings as to that standard?—I mean the gold exchange standard, in order to avoid ambiguity, let us say the English system, that is our ideal. But before approaching that ideal, in view of Indian conditions, we necessarily have to go through the procedure which England has gone through for the last hundred years, namely, gold standard and gold currency, and learn the use of gold which we do not understand at present.

4129. Now there is one other point. In estimating the amount of gold and expenses involved in the introduction of the gold standard, you have told us that you think it would cost about 50 crores. I am not quite sure whether, in arriving at that figure, you have taken into account that, apart from giving the country a gold currency, it would be necessary to provide reserves against your note circulation, which, I take it, will have to be at least as large as the reserves which you have under your present system or the gold exchange standard system?—I think I have referred to it in the body of my statement, that whatever practicable reserve system, paper currency system, we decide upon as a permanent thing for the future, during the transition period when we have to mobilise our gold resources with a view to have an effective gold standard, it will be necessary for the Government to allow the metallic portion of the reserve to go down to a minimum level.

4130. What is that minimum level?—That is a level which will have to be worked out with reference to the possibility of notes being presented to the Government for immediate conversion during the transition period. Ordinarily, of course, the Government keeps a larger metallic reserve than it immediately requires, and just as during the war measures these reserves were allowed to go down, similarly similar measures may be taken with a view to see that the required gold in the paper currency reserve is less than the permanent requirements, so that the introduction of the gold standard may be helped by that method.

4131. Now what would be your proposition under the full gold standard, with gold in circulation? What would have to be the reserve requirements against your notes then?—I generally agree with the suggestion made here in the scheme presented to me.

4132. I only wanted to know whether you thought these reserves would have to be at least as substantial as under any other system?—I think so. Of course, paper currency will have to be supported by quite a good substantial reserve.

4133. Because you do not rely upon the gold in circulation as readily available if it is necessary to correct some tendency of the currency to depreciate?—Excuse me, Sir; I do not quite agree to that proposition. Gold, if it is in circulation with a gold standard and gold currency and if the Imperial Bank is selling and buying gold as the Bank of England does, we shall have an automatic contraction or expansion of the gold currency, if trade conditions required it; so that there would not be any danger of the nature you describe.

4134. (*Sir Reginald Mant.*) You said in reply to the Chairman that in your opinion a 1s. 4d. rate of exchange would be of more permanent benefit to the producer in the country than a 1s. 6d. rate?—Yes.

4135. I want to elucidate the grounds on which you base that opinion. You said, I think, that the producer sells more than he buys and therefore, you thought he would make a larger profit at a 1s. 4d.

rate than at a 1s. 6d. rate. Now let us suppose that the producer makes a profit of Rs. 40. At the rate of 1s. 6d. he could purchase three sovereigns with those Rs. 40 or three pounds' worth of commodities; at the rate of 1s. 4d. he would make a profit of Rs. 45 with which he could purchase three sovereigns or three pounds' worth of commodities. Will you explain how he is better off in the latter case than in the former?—So far as the agriculturist household is not buying in the open market the food and other requirements which they supply for themselves, to that extent the market rate does not affect them, the higher level of prices at the 1s. 4d. rate which is suggested as an objection does not affect them either adversely or favourably—I mean the agriculturist chiefly because and to the extent that he does not enter the open market for purchasing the ordinary requirements of his food which he grows for himself, so that the other things which he grows like cotton and jute and so on he sells in the open market and he gets a higher price at 1s. 4d. than at 1s. 6d. This he would invest not in all his requirements, because some of his requirements are already fulfilled by his own personal exertions; some of his other requirements, less important than his immediate necessaries he fulfils by purchasing with the means which he has thus acquired. If his selling transactions and his buying transactions were equal, if the agriculturist's economy were of the modern type, a money economy entirely, then I suppose your contention would be correct.

4136. I have made no contention. I have asked a question, and I am waiting for an answer to it?—I am trying to explain the point of view which I emphasised in answer to the Chairman that I believe on account of the state of society we have in the districts their selling transactions are more than their buying transactions collectively and therefore they stand to gain in that particular respect.

4137. You still have not answered my question. You have said that they stand to gain and I have shown you that the gain as far as I can see it would be precisely the same in either case, and what I asked you is how they will gain more by getting Rs. 45 which have only the same purchasing power as the Rs. 40 under the 1s. 6d. rate whether he invests it or spends it, how is it of any greater value to him?—I am sorry I cannot catch your point still.

4138. I will repeat it. We are assuming that the agriculturist or the producer makes a profit of Rs. 40 under a rate of exchange of 1s. 6d.; if exchange is 1s. 4d. he would make a profit of Rs. 45 which he may either invest or spend. I have pointed out to you that the purchasing power of those two sums would be precisely the same in each case and I asked you how the producer has benefited from the alteration in the rate of exchange?—In the one case when he is getting Rs. 45, I mean I start with the proposition that all these rupees he acquires he does not spend in the open market to the full extent.

4139. Let us assume that for either investment or for expenditure?—So that he will be left with a larger number of rupees to himself if prices have completely adjusted themselves.

4140. We are assuming that; we are contemplating a permanent adjustment?—If that desirable state of affairs arrives then your position would certainly be correct.

4141. Then you do not maintain your position that a lower rate of exchange is a permanent advantage to the producer?—I do maintain it, Sir. I am sorry if I have not correctly understood your question.

4142. (*Sir Reginald Mant.*) I understood you to withdraw from your position when you said that when prices have been completely adjusted the results would be precisely the same, the profits would be precisely the same.

4143. (*Chairman.*) I cannot help thinking the difference between you is the assumption whether prices have been completely adjusted or not. The Professor, I rather think, is making a reservation that prices are not completely adjusted.

4144. (*Sir Reginald Mant.*) Is that correct? Do you assume that prices will not be completely adjusted?—I mean if we have complete money economy then the idea of price adjustment in the ordinary economic sense is correct. But we in India not having that sort of complete money economy over the length and breadth of the land, such a complete adjustment will not take place.

4145. Of course if that is your contention then your position is intelligible; but on the supposition that there was complete adjustment I could not understand your position?—I am glad to be corrected by the Chairman. I hope you understand my position.

4146. (*Sir Purshotamdas Thakurdas.*) With reference to the last question, do you think the adjustment of prices has been achieved by now or prices still remain to be adjusted at 1s. 6d.?—I think they have still to be adjusted.

4147. So that any change from 1s. 6d. would not mean that you are disturbing a settled surface?—Not in the least.

4148. Regarding Sir Henry Strakosch's question in connection with the primary object of introducing gold standard, Professor Vakil, you said that education of the masses in the habit of investment was one of the main objects of giving them gold currency. Have you any other object in view in introducing a gold standard besides education of the masses to invest?—I mean we shall have greater stability of prices internally, we shall have greater stability of external exchange by the machinery suggested and we shall have the possibility of unhoarding the gold which is being wasted at present.

4149. That is included in educating the masses to invest in future. Now if I may turn to that portion of your memorandum headed "Gold Standard in India" (Appendices, page 180), you say there "In India under present circumstances the sudden introduction of gold notes as the only full legal tender without gold coins is likely to be misunderstood." Will you explain what was in your mind when you said it is likely to be misunderstood?—I mean the ordinary man in the street at present is accustomed, he knows that a ten-rupee note can be converted into ten rupees, and that conviction makes him handle the note. If that conviction were not there it would be very difficult for the note to circulate. Similarly with gold notes, in circulation, if that conviction did not exist the man in the street would hesitate to handle gold notes.

4150. Therefore if people saw it printed on paper that one gold mohur will be given for it but if they never saw handed back to them in exchange for it at the currency office window the gold mohur they would not have any confidence even to the extent of the confidence in silver notes to-day?—Yes, Sir, that is so.

4151. Do you think that aspect should be borne in mind in considering any scheme?—I think so. We had experience of that kind in the War.

4152. Would you put it as high as this, that of all considerations for the purpose of greater confidence in people with regard to currency notes, this consideration should be put at the top?—I think so.

4153. Is it therefore that you said that this gold standard may not succeed if people did not see gold in exchange for paper, if they were only told that gold was in the bank, you can get it when you want it for export out of the country—that would shake their confidence?—Yes, Sir.

4154. And no risk should be taken in this connection at all?—Yes.

4155. Now regarding the ratio, I think you said in your reply to the Chairman that when the rupee is made limited legal tender you do not mind if its conversion into gold is fixed at two shillings or 1s. 2d. to the rupee. I would like to understand clearly whether you think that, when the rupee is made limited legal tender, the ratio for the conversion of the rupee even for internal prices does not matter. I would like to ask if, when the Government of India Loan due in say 1945-55 is paid in

gold currency in 1945, in your opinion it does not matter at what ratio the said loan floated in rupees last year is converted? Do I understand that you think there is no difference whether the Government of India in 1945 pay 1,000 sovereigns at the equivalent of 1s. 4d. for Rs. 15,000 or whether they pay 1,500 sovereigns at the equivalent of 2 shillings?—I certainly do not go to that extent.

4156. But you did?—I shall try to modify my statement.

4157. Yes, if you wish to, because it is very important for us to understand what you meant when you said that?—I stated as a general principle that a subsidiary coin when related to the main coin of the country may be rated according to convenience. But I did say when answering the Chairman that the factor of convenience should be given consideration, and if we find when we have a full gold standard in operation the rupee has to be finally fixed in relation to the chief gold coin, the convenience of the country from the point of view of the people and from the point of view of Government in the manner you describe should certainly be considered before fixing the rate.

4158. Excuse me, but is it a question of convenience or of hard rupees?—I quite understand your point; it would be absurd to introduce or to think of such a measure being taken.

4159. Very well, therefore, even when you make your rupee restricted legal tender, the question of the rate at which the conversion of the rupee into gold value, we will drop the shillings and pence, will take place will have to be considered in connection with the ratio?—Yes, so long as full conversion has not taken place, rupee transactions will continue to be of importance.

4160. And rupee debts?—Yes, of course the position of the rupee will have to be taken into account. When I made that very sweeping statement that it loses its importance. . . .

4161. It loses its importance when all the token coins have been converted?—Thank you, Sir, I am glad to be corrected. I would like to modify the statement that I made in this manner: it loses its importance, when all these things are taken into consideration.

4162. When all the token coins have been practically converted then it becomes a purely subsidiary coin?—Yes.

4163. Now, will you agree with me when I say that even under your scheme of gold standard as you contemplate it, there are stages when the scheme is a mere gold exchange standard until you come to the final stage where the rupee is limited tender and the Government undertake the liability to pay out gold in exchange for rupees?—During the transition period of course.

4164. And the transition period is by no means less than five years?—It may be about 10.

4165. You have said that with the gold exchange standard you would like the ratio to be 1s. 4d.?—Yes.

4166. What would you then say, that it should be 1s. 6d. until your gold standard scheme comes into force or would you say that for the present 1s. 6d. should be kept on or 1s. 4d.?—My answer to the Chairman was about this practical difficulty. If during the transition period we immediately make efforts to revise the rate to 1s. 4d., it may mean additional rupee currency; to have additional rupee currency means greater difficulties for introducing the gold standard.

4167. I do not want to interrupt, but I remember that in that reply of yours you also said that if there is a gold exchange standard put in force permanently you would like a reversion to 1s. 4d.?—Yes.

4168. *Sir Purshotamdas Thakurdas.*) As your scheme also involves a gold exchange standard in one form or another for 5 or 10 years, would you say 1s. 4d. is necessary to-day, or would you say that it should be kept at 1s. 6d.?

4169. (*Chairman.*) Let us remind ourselves of the witness's answer. What he then said was that, if his other measures were adopted, that is, leading up to the institution of the full gold standard, he would retain 1s. 6d.?—I would not mind it for the present; that is what I said.

4170. (*Sir Purshotamdas Thakurdas.*) Then you said that 1s. 4d. should be for the gold exchange standard as before the war?—I think I have discussed that with the Chairman; there are two distinct schemes; if we had permanently a gold exchange standard scheme my general proposition was that 1s. 4d. was better. If we have an immediate introduction of the gold standard with the necessary stages, it would be better for the introduction of that standard to have less rupees than more; and with that point in mind I believe I said that we need not enter into the difficulty of reducing the rate to 1s. 4d.

4171. I think you agreed with the Chairman for the purposes of the discussion that gold worth 130 crores of rupees would be required to convert the 100 crores of rupees which would come in, and on other accounts before you could adopt a gold standard?—About that.

4172. In connection with the question as how the import of such a large quantity of gold into India may disturb world prices or the world equilibrium as at present, do you know of any disturbance in the world owing to the import into India last year of 73 crores of rupees worth of gold? Have you heard of that?—No.

4173. And is there any reason why there should be any special disturbance in the world gold markets if the necessities of India are arranged according to what you have said (I took down the actual words) with the powers by diplomatic measures?—I do not think so.

4174. When you say in your written statement that India's rights to get gold should be ascertained, I suppose you did not mean anything more than that you have faith in the sense of fairness of international powers in the matter of recognising what is India's right in the ordinary course, and you count upon that to enable India to get gold?—That was the spirit of my answer to the Chairman.

4175. With reference to what you have said in section 4 of the advantages, where you mention that foreign capital if required will be available with greater ease than before, owing to stability of exchange, and that people will learn to use their hoarded gold in a better way: that is because the exchange would be stable in gold, is it not?—Yes.

4176. Do you think that if instead of the suggestion that the ratio should be changed from 1s. 4d. to 1s. 6d. there was a suggestion or there was a consensus of opinion which compelled the ratio to be lowered from 1s. 4d. to 1s. 2d. we will say, foreign capital would be absolutely disturbed and would fight very shy of any investment in India?—I am sorry I do not quite follow.

4177. The ratio till now has been 1s. 4d. Supposing there was a suggestion or a necessity to reduce 1s. 4d. to 1s. 2d., would not that hit foreign capital here?—It would.

4178. And it would be so bad that foreign capital perhaps may completely fight shy of India?—So long as such fluctuations exist.

4179. I mean, if it was necessary to change the ratio to 1s. 2d., it would be absolutely detrimental?—Yes.

4180. Therefore in order to ensure that foreign capital may not have any such shock in the future under any scheme you want to ensure stability in gold?—Yes.

4181. (*Chairman.*) On behalf of my colleagues I would like to say we are very much obliged to you for the very full assistance you have given us this morning?—May I have your consent, Sir, to the publication of my memorandum?

4182. The proceedings of the Commission, as you know, are private, but the Commission has no objection to the publication of your memorandum?—Thank you, Sir.

(*The witness withdrew.*)

Mr. P. A. WADIA and Mr. G. N. JOSHI, called and examined.

4183. (*Chairman.*) Professor Wadia, you are a Master of Arts and Professor at the Wilson College in Bombay?—Yes, Sir.

4184. And Professor Joshi, you are also a Master of Arts and also a Professor in the Wilson College, Bombay?—Yes, Sir.

4185. We have had the advantage of a very full memorandum* from you gentlemen, which you have prepared, I understand, jointly?—Yes, Sir.

4186. Which will enable us to direct the discussion towards your opinions. To whom shall I direct my questions in the first place?—(*Mr. Wadia.*) I shall begin.

4187. To Professor Wadia in the first instance, and if Mr. Joshi cares to supplement the answer in any way I will provide him with an opportunity. We are obliged to you, gentlemen, for your memorandum, on which I will ask you a few questions just to ascertain where the emphasis is laid in your views and to elucidate any points which may seem to require elucidation. The first part of your memorandum, Mr. Wadia, relates to historical matters?—Yes.

4188. I have only one or two elucidatory questions to ask upon this portion. About the middle of the first paragraph, you say: "The effective and ever-increasing use of these substitutes—bank notes, cheques and bills—depended on the confidence in the public mind that whenever gold was wanted for internal purposes or for export, it was readily available." Was gold, as a matter of fact, readily available for internal purposes during that period?—Well, what are the countries to which you would refer?

4189. The same countries as those to which you are referring?—Well, that statement should be taken as generally true, though possibly in one country or another there may be difficulty in procuring gold for internal purposes.

4190. Would you consider that the use of the substitutes was due to this availability of gold, or what would you say to the opposite school of thought which, as we know, would contend that the confidence in the substitutes was due not to the ultimate interchangeability with gold but to the circumstance that in fact these substitutes represented stable values in commodities?—Well, an effective banking organisation facilitates the use of these credit substitutes and an effective banking organisation also guarantees in a sense that whenever gold is wanted for its substitutes it will be readily available.

4191. I understand from your reply that in a country in which there is no effective banking system the only means of establishing confidence in the substitutes for gold is that they should be readily interchangeable into gold?—Well, public opinion could be educated to the use of substitutes. (*Mr. Joshi.*) May I supplement that answer, Sir? The stable value of substitutes for gold coins in terms of commodities were guaranteed simply because there was a confidence that in the last resort they were exchangeable for gold. And it was the inner confidence on the part of these holders of substitutes for gold coin that they could get gold in return whenever they wanted that was responsible for the stable value.

4192. That is the opinion which I am seeking to examine, and I was asking what your opinion would be upon the alternative contention that, as a matter of fact, what established confidence in the substitutes was not ultimately their ready interchangeability into gold but the circumstance that, as a matter of fact, the relative value of these substitutes in terms of commodities was stabilised?—(*Mr. Joshi.*) But the relative value of the substitutes in terms of commodities was circumstanced by the fact that they were interchangeable for gold.

4193. Now as regards the conditions in India, where you point out, Professor Wadia, that there is at present no general use of the banking system, is it in your opinion the case or is it not that, under present conditions as evidenced by the increase in the note circulation, the public is as a matter of fact being educated in confidence in the use of notes as a means of currency?—Yes, undoubtedly.

4194. What would your opinion be as to the effect of increasing that confidence in the rupee note as a medium of circulation in a period during which the gold value of the rupee would have been stabilised?—May I ask you to repeat the question?

4195. Proceeding from your last answer, that the public is being educated in the use of notes, what in your opinion will be the effect in the acceleration of that educative process of a period during which the gold value of the rupee has been stabilised, recognising that during the difficulties and disturbances of the last ten years the gold value of the rupee has been far from stable?—I don't see the connection. I don't see any close connection between the two. The circulation of the note depends upon its encashability in terms of rupees because at present the note is in terms of rupees. And I don't see what close connection there can be between them.

4196. Might one take it in this way—that the acceptability of the note depends, as you say, upon its encashability into rupees?—Yes.

4197. The stability of the purchasing value of the note depends on the stability of the purchasing value of the rupee. We have passed through a period during which the purchasing value of the rupee has been violently fluctuating. Would it in your opinion or would it not tend to increase the popularity of the note if the country were to pass through a period during which the gold value of the rupee had been effectively stabilised?—I don't really think that the popularity of the note will be very seriously affected in any way by the fact that by artificial methods the rupee is going to be stabilised.

4198. You would not attach any great weight to that?—(*Mr. Joshi.*) As a matter of fact it was during the period of violent fluctuations in the purchasing power of the rupee in terms of commodities that the popularity of the note in India was the greatest, because it was during the war period after 1916 that the total circulation of notes in India increased enormously. Between 1861 and 1914 the gross circulation amounted to only 120 crores. Between 1914 and 1916 it increased to 190 crores. As a matter of fact the fear which you apprehended regarding the popularity of notes varying and fluctuating very rapidly in terms of commodities is not just the right sort of fear.

4199. Yes, I understand. As a matter of fact, no doubt, Professor Joshi, you would contend that it would be improper to lay any great emphasis upon the increased circulation of notes during the war period because, in view of the enormous requirements for currency at that time and in view of the impossibility of increasing the rupee currency, an increase of the note currency was, as it were, forced. So that the fear which you apprehend regarding the popularity of the note were its value to fluctuate very rapidly in terms of commodities is not just the right sort of fear?—May I ask you what is the fear which you are entertaining when you say that during the transitional period of stabilizing the rupee, the point which you are making is whether the popularity of the note will be affected during this period by the violent fluctuations in the purchasing power of the rupee? Is that the point which you are making?

4200. My point was intended to be your point, that no great emphasis should be laid upon the increase in the note circulation during the war period as showing an increase in the popularity of the note, because as a matter of fact it was the only way in which circulation could be increased and therefore it was as it were a compulsory measure and not due to any increase in demand?—To some extent I subscribe to your view, but at the same time I lay emphasis upon the fact that people are more educated now and more familiar with the notes than they were in 1914.

* Appendix 20.

4201. It is your opinion then that we may expect to see an increase in the note circulation based upon the growth of the popularity of the note?—Yes.

4202. Now before we come to the substance of your memorandum, there is a question in a lighter vein, Mr. Wadia, I would like to ask you. Is it quite right to say that you have only to offer in theoretical defence of the gold exchange standard before the war Mr. Keynes?—I am open to correction.

4203. (*Chairman.*) Let me suggest to you the names of Plato, Ricardo and Mill.

4204. (*Professor Coyajee.*) And Professor Kemmerer.

4205. (*Chairman.*) Would you accept these names as the names of economists of reputation or not?—Yes, Plato and Ricardo without any demur.

4206. And, as I am reminded, there was the Genoa Conference.—(*Mr. Wadia.*) The Genoa Conference was thinking of a somewhat different kind of trouble.

4207. Would you amplify that?—The problem before the Genoa Conference was the problem of what to do in the case of countries which have not enough gold resources to go back immediately to a gold currency apart from other difficulties, and therefore they thought that if we could economise the use of gold by sparing it so far as internal purposes are concerned and use it only for external purposes, we would be in some way helping those countries to restore the monetary stability. In the case of India the issue is altogether different; we are not starving for gold; so that under those special conditions, the Genoa Conference may have been justified in recommending a gold exchange standard for countries situated as some of these European countries were. We are entirely differently situated.

4208. What is the essential difference?—India can command the gold on account of its favourable balance of trade from year to year. We shall not be lacking for want of gold. Those countries have that difficulty, so that I cannot accept the Genoa Conference as having any bearing on the Indian problem.

4209. The favourable balance of trade at the present time is covered partly by the settlement of the so-called Home charges?—Over and above the Home charges there is an enormous balance.

4210. That is one element, and, secondly, by the importation of gold in various forms?—Yes.

4211. Which is made use of at the present time by the people of the country in various ways for ornaments?—Not necessarily all of it at the present time. If there was a free gold mint with all the facilities of a gold standard, much of the gold that now comes to India would flow back to the mints; it is not all intended for non-monetary uses, and a considerable part of it may be attracted to monetary uses.

4212. That would be to provide for the normal increase in the currency which was required from year to year?—Yes.

4213. To provide for a substitution of the existing currency by gold you would require an additional supply of gold?—I am coming to this point. (*Mr. Joshi.*) As a matter of fact the Genoa Resolution only suggested an expedient or palliative during the transitional period when countries which over-issued their notes during the war could not find out——

4214. Your impression of the recommendations of that Conference, Professor Joshi, is that the gold exchange standard was recommended as a temporary expedient pending a general return to a full gold standard?—(*Mr. Joshi.*) Yes, because Professor Cassel, who also participated in that Conference, has expressed himself in favour of the gold standard in his latest book, "Fundamental Thoughts on Economics"; has not wavered in the conviction regarding the desirability of a gold standard in the present circumstances of our knowledge and experience.

4215. Of course, Professor Cassel's views might be one thing and the opinions of the Conference might be another?—(*Mr. Joshi.*) But as a matter of fact the Genoa Conference dealt with a problem which was entirely a European problem.

4216. You are of the opinion that the recommendations of that Conference had no application at all in India?—(*Mr. Joshi.*) Yes; moreover, I will further enlarge and say that the Resolution was meant to economise the use of gold, and the gold exchange standard as it operated in India has resulted in the most unproductive use of the gold which she commanded.

4217. That is a point raised in your memorandum to which we shall come later?—I am just making the remark that it is possible that the immediate difficulties obsessed the minds of the people at Genoa and that may be partly responsible for the emphatic manner in which they recommended the advantages of a gold exchange standard.

4218. The essential difference we understand in your opinion being that India can command a supply of gold up to the need of its requirements?—Yes, and we want to economise gold just as much as those countries.

4219. Proceeding to your memorandum, in the first paragraph, under the head "Examination of the Theory" (Appendices, page 189), Mr. Wadia you say: "If the gold exchange standard aims primarily at fixity of exchanges, it is aiming at what is merely a facility or convenience to those engaged in foreign trade, and not at what is of profound importance to the country at large. Assuming that the gold exchange standard secures stability of foreign exchanges, does it secure relative stability in the internal level of prices?" Is it possible by the adoption of one currency standard rather than another to secure any greater relative stability in the internal level of prices? Do you get it more by a full gold standard than by a gold exchange standard?—The index numbers between 1900 and 1914 throw a light on the history of prices in India.

4220. That is, the old pre-war course of prices?—Yes.

4221. I understand from that reply that it is your opinion that the gold exchange standard as it existed then was responsible for some instability of internal prices?—Yes.

4222. Will you amplify that, Professor, and show us by means of figures how that occurred?—I am sorry I have not got the index numbers here, but there is no doubt of the fact; we have shown it in a volume that is in Messrs. Macmillan's hands; the index numbers in India show a higher level throughout this period, 1900 to 1914, than the general level of prices in gold standard countries; and that is a fact to which Mr. Keynes himself bears witness in one of the articles that he wrote in the "Economic Journal" as early as 1909. He there distinctly finds out that the prices in India were considerably higher than prices in Great Britain and elsewhere.

4223. No doubt you have in your mind figures in support of that point of view. What is the source of those figures?—We are referring to such index numbers as were calculated for those periods.

4224. I have before me a very brief summary of the Calcutta index numbers for that period. May I put it to you and see whether in your opinion it supports that contention. Taking 1895 as the base of 100 and comparing the indices for India, England and the United States of America, during the pre-war year 1913 and comparing these with the base year of 1900 I find that these indices give for India in 1913, 138; for England, 137; and for the United States, 141. Taking those figures for what they are worth, do they show any relative instability or maladjustment of prices in India in comparison with those of the world at large?—I am not prepared to take those index numbers without further study.

4225. I must not ask you to take them without further study, but those are the only index numbers available?—We have made out a very clear case. I am sorry I have not got a copy of the manuscript. As I said, Mr. Keynes admitted as early as 1909 that the index numbers show a remarkable rise as compared with the index numbers of England.

4226. You will no doubt recognise that this Commission must seek to go behind personal authority,

even although it is the very highest?—I am quite prepared to show the index number that we have prepared.*

4227. I think it would be of very great interest if you could indicate for our enlightenment the figures which you have in mind?—(*Mr. Joshi.*) There are regular index numbers, and I can authoritatively state without fear of contradiction that the index number of Indian prices was higher than the index number of prices in Great Britain or elsewhere.

4228. To what index number are you referring?—The index number of the Government of India is rather an illusive phenomenon, and taking the index number on which we can lay our hands so far as India is concerned, we can say clearly that the rise of prices in India is higher than the general rise in the world.

4229. We understand that we shall have the benefit of considering any calculations that you have been able to make on this subject. If I understand your contentions, it is that the instability was due to the circumstance that there was no provision for the automatic contraction of the currency under the pre-war system?—Yes.

4230. The next question which I am going to ask you is in order to elucidate whether or not such a defect as that is remediable on a perfected gold exchange standard, or whether, on the other hand, it is irremediable. We have placed before you some outlined proposals.† Let me draw your attention in those outlined proposals to the proposal outlined in paragraph 4, which is there described as an " attractive " proposal, the word really being " alternative." If you have been able to give consideration to that alternative proposal, it is a proposal, as you see, for the combination of the reserves and for the use of the combined reserve, with definite limitations, as a means of covering the external value of the internal currency of the country. Were the reserves to be combined in that manner, with definite limitations as to the proportions of the reserves, would that or would it not, in your opinion, provide a mechanism which would effect the automatic contraction of the currency and thus remedy the defect in the pre-war system to which you have referred?—Any provision of statutory obligation on the part of the Government to give gold coins or sterling in exchange of rupees may not remedy the defect or will not make the system automatic, and even if it makes it automatic, well, it does not secure a sound monetary system for India.

4231. Leaving aside the general question, supposing the system provides for the automatic contraction of the reserves against the sale of external currency or internal currency, would that or would it not, in your opinion, remedy this defect in the pre-war system to which you have referred?—It will not, because normally India has a favourable balance, and so long as there is a favourable balance, there is no room for contracting currency. You could contract currency only by the sale of reverse bills; that means when there is an adverse balance.

4232. If I may seek to follow you step by step, is there in general any necessity for contracting the currency when there is a favourable balance?—But favourable balance may be adjusted either by way of currency or by a shipment of bullion.

4233. In fact and in practice, does not the necessity or the desirability for a contraction of the currency arise when there is a temporary turn of the balance either to make it adverse or less favourable?—I do not follow you.

4234. As a matter of fact, in practice does not the need for the contraction of the currency in order to support the gold value of the internal currency in general only arise when the balance of trade either becomes positively adverse to the country or, on the other hand, less favourable than the normal?—When it is less favourable than normal, there is no necessity for contracting the currency, because, as a matter of fact, it is only in case there is an effective adverse balance that there is room for contracting the currency and any statutory obligation on the part of the Government to give international currency or gold in exchange of rupees would only arise when there is an adverse balance, and for a country like India, even this provision will not make the currency automatic, and that will be a dead letter. Statutory obligation on the part of the Government when there is a favourable balance would be a dead letter, so far as contraction of the currency is concerned.

4235. Would you agree, Professor Joshi, that the defect in the pre-war currency might be thus expressed: that in a bad year reverse council bills would be sold, but that there might be no resultant contraction of the currency which would serve as a gradual automatic correction to the influences which were making for the weakness of exchange?—(*Mr. Joshi.*) That is true for bad years. For bad years there is a provision. If the statutory obligation is undertaken, then for bad years we do get an automatic provision for contraction. But the point I am making is that normally there are very few bad years, and during these years there is no room for automatic contraction of currency in this country, even under this improved gold exchange standard system.

4236. Under a full gold standard, how would the currency be contracted?—The mint value and the market value being identical, there is an alternative use for the currency. Here in India under the gold exchange standard there is no alternative use for the rupee. It is only a note printed on silver, an inconvertible note at the same time.

4237. Turning to your memorandum, in paragraph 18, you say: " Finally the stability of price level . . . may not be equally desirable for a country like India with potentialities of industrial development in the future and for whom therefore slowly rising prices, not due to overissue of tokens, but resulting from the adoption of a gold standard, may be a necessary stimulus to industrial expansion." The question I want to ask you upon that is this: Is it in your opinion, in the first place, quite clear that a state of a slow rise in prices is in the interests of the whole national community in such a country as India where industrial interests are only a comparatively small portion of the total interests of the community?—(*Mr. Wadia.*) But we believe the need for industrialisation to be so urgent in this country that even if slightly rising prices may mean a loss to agriculture we will be prepared to face it.

4238. I will put it very crudely. I am sure you will not accept my suggestion. Your answer does suggest that you are prepared to sacrifice agricultural interests to the interests of the country?—Assuming that there is a conflict.

4239. Let us take it on that basis: Is there or is there not a conflict between the interests of agriculture and industry in this matter of the desirability of a slow rise in prices?—(*Prof. Joshi.*) What we mean is this: An upward trend in the general level of prices which is genuine and natural by the adoption of a gold standard does not create any difficulty for the agriculturist and where there is a gradual upward trend in prices, there is no conflict of interest between the various sections of the community as such. That is all that we mean. What we are against is an artificial rise in the general level of prices which is the result of an enormous issue of token coinage.

4240. May I ask a question on that? I suppose it might be said, might it not, Prof. Joshi, that any change in price levels which is the result of the introduction of one currency system rather than another is an artificial change? Would not, therefore, your objection to artificial changes in price levels apply as much to those which would result from the introduction of a gold standard as those which would result from direct inflation?—By the introduction of a gold standard, there will be an artificial increase in prices. On the contrary, we are making it more natural.

* Printed as Appendix 21. † Appendix 2.

4241. Will you amplify a little your answer, in which you express the opinion that the gradual rise in prices would not be contrary to the interests of the agricultural population?—India being overwhelmingly an agricultural country and as she is an exporter, agriculturists as consumers may be affected adversely, but as producers of raw materials and food grains and as exporters they will be benefited by a rise in prices.

4242. Will not the prices which will be most directly affected be the prices of articles imported into India?—Under the gold exchange standard there is no safeguard. The difficulty or the result is worse under gold exchange standard than under the gold standard. That is the point we make. We are choosing between two evils, if at all they can be called evils.

4243. To make this matter as clear as it may be made, why, in your opinion, would the adoption of a full gold standard result in a rise in prices?—(*Mr. Wadia.*) Well, we are judging from the experience of gold prices roughly over 70 or 80 years. The production of gold has fairly kept a little in advance of the increasing demands for gold for monetary purposes.

4244. That refers to the world's total supply?—Yes; and there has been during the last 70 or 80 years a slow upward movement in prices, I mean taking the thing as a whole and not judging by individual decades.

4245. I understand the effect of your answer is that the result of pegging the rupee to gold would be that, in consequence of the relative supply and demand of gold in the world at large, there would be in India a slow rise in prices?—If we have a gold standard, Indian gold prices will follow world movements.

4246. That involves the opinion, as I understand it, that the general movement of world gold prices will be a rise in the world gold prices?—Judging from the past it has been so. It is very difficult to predict what the future may bring.

4247. Have you been able to make any study as to the relative supply and demand of gold and its effect upon world gold prices in future?—So far as estimates are concerned, we are told that the average gold production during the next five years may continue to be on the same footing as during the last five years.

4248. What estimate are you basing that statement on?—(*Mr. Wadia.*) We are referring to the Gold and Silver Commission's Report of the United States of America which has been issued only in the beginning of this year. (*Mr. Joshi.*) The Report on Foreign Currencies.

4249. I understand that, forming as good an estimate as the knowledge at your disposal enables you to make, you are of opinion that there is going to be a general rise in world gold prices in the future; is that a general opinion?—(*Mr. Joshi.*) We cannot give any definite opinion on that. Of course it is simply a question of forecast; it entirely depends on the policies of various countries and the attitude of the United States of America towards the European countries also.

4250. In paragraph 19, you say: "If we turn to the question, has the gold exchange standard during the period that it worked, namely 1900 to 1914, secured stability of exchanges, the answer is simple. Stability of exchange under the gold exchange standard is practicable and can be maintained at any ratio at or above 1s. 4d. so long as India has a favourable balance of trade and so long as the price of silver is below 43d. an ounce. These two conditions were present during the period. When in 1907 one of these conditions was absent the system was on the point of breaking down, and during the War when the second condition was absent it broke down completely. Stability of exchange under the gold exchange standard depends upon conditions which the gold exchange standard itself does not necessarily secure." Are these conditions to which you refer secured under any conceivable currency standard, including that of a full gold standard?—(*Mr. Wadia.*) Of course not. No standard by itself will secure these conditions.

4251. Any system which might be devised, including that of a full gold standard, would be liable to strain, supposing that conditions had become adverse?—(*Mr. Wadia.*) If your question implies that the gold standard will not secure stable exchange I differ from that implication because if you primarily secure stability of internal prices stability of exchange follows as a matter of course. (*Mr. Joshi.*) When the world has got one international standard of value stability in foreign exchange is automatically guaranteed when that standard is adopted by all countries, and though a gold standard does not secure completely an absolute fixity of exchange or stability in prices, still it is the only method that human ingenuity can devise under present circumstances which can secure both these objects.

4252. Taking it under two headings, first of all the heading of balance of trade, let me put my difficulty in apprehending your point of view. Whether it be under a gold exchange standard or under a gold standard, the value of India's internal unit is stabilised in relation to gold. What is there then in this circumstance to which you refer, an alteration in the balance of trade, which inflicts a heavier strain upon the stability of the system whether the system be a gold standard or a gold exchange standard?—(*Mr. Wadia.*) I cannot quite catch your point.

4253. Under either system, a gold standard or a gold exchange standard, what you are maintaining is the stability of the rupee, the gold value of the rupee?—(*Mr. Wadia.*) No, under the gold standard questions as to the stability of the rupee do not arise at all because then the rupee becomes a token coin and our prices will be in gold.

4254. Then we will consider that if we may, in connexion with your proposals for the establishment of a full gold standard. Let us take the second inference, and that is the price of silver. It is necessary to anticipate a little, in order to elucidate this matter by asking you this. I imagine you contemplate that, even after the establishment of a full gold standard, there will be a substantial amount of silver rupees in circulation?—(*Both witnesses.*) Yes.

4255. Because they are necessary for the small transactions of the country?—Yes.

4256. The disadvantage to which a system is liable upon the occurrence of this cirsumstance is that the rise in the price of silver takes the value of the rupee above melting point. Is that not a disadvantage which will have its reactions under a full gold standard?—(*Mr. Wadia.*) No, limitation of supply is quite enough by itself to secure the face value of the token coin. All that we need is limitation of supply.

4257. I understand that, under that system, the value of the rupee will be fixed as a portion of that of the gold unit?—Yes.

4258. If that be so, would it not be that a rise in the value of silver would carry the intrinsic value of the rupee above its token value as a part of the gold unit?—(*Mr. Joshi.*) We are concerned with the immediate problem and at present silver is 32 pence an ounce. There is no possibility for a year or two of its going above 43d. After the introduction of a full and complete gold standard, if it is desired to reduce the weight of the rupee in terms of silver that may be considered in the future but not to-day.

4259. I quite recognise the force of your contention, but if that be so, if the problem does not present itself, it does not serve to discriminate between the relative advantages of the two standards?—(*Mr. Joshi.*) It does.

4260. How can that be if the problem does not arise owing to the improbability of a rise in the price of silver?—(*Mr. Joshi.*) You see the point we are making is that it is not owing to the intrinsic soundness of the gold exchange standard that it secures a stable exchange, but it is simply because the price of silver is much below the face value of the rupee.

4261. My question is a very simple and practical one. Even under the gold exchange standard the price of silver might rise so far as to make it

necessary for you to take measures as regards your token currency. Every other country, even England, did so after the War?—(*Mr. Joshi.*) We also in this country had to do so when the price of silver was above 43 pence an ounce. Measures are to be taken.

4262. How do you propose to deal with a situation under which the price of silver has risen so far as to make it worth while to melt your token coin?—(*Mr. Wadia.*) If silver is the token coin, it is open to the Government to reduce the fineness of the coin or the weight of the coin. (*Mr. Joshi.*) But those are only remote contingencies. That problem does not arise in present circumstances.

4263. In so far as the problem is worth taking into consideration, you are not relieved, by the adoption of a full gold standard, from having under such conditions to substitute some other token currency for your overvalued silver rupees?—There is all the difference between a token coin limited in supply and whose face valuo can be kept up and a token coin whose supply is not limited.

4264. Now I should like your opinion on this point from your wide experience of the psychology and habits of the people. Supposing the rupee has been reduced as you propose to the position of mere small change; supposing that it is necessary, owing to a rise in the price of silver, either to substitute a silver rupee of less content or somo other token currency; supposing also, if I may continue the list of suppositions because it is necessary to make my questions clear, we are in agreement that there must still be a large volume of rupees outstanding; what will be the political and social reactions on the uninstructed public even under those conditions of a reduction in the actual intrinsic value of the rupee. Would it be serious or not?—(*Mr. Joshi.*) I will answer under two heads,—first, that all the suppositions are too remote, suppositions which cannot be supposed under the circumstances in which we are placed, *e.g.*, that the price of silver will go above the price fixed by Government. . . .

4265. I must point out that if that is too remote the whole question is too remote, and there is no need to discriminate between the two systems?—That is the first part of my answer. The second part of the answer is that undoubtedly there will be great reaction in the mind of the people because they are accustomed to the silver rupees, and before any question of reducing the weight or fineness of the rupee is thought of seriously, it ought to be considered from all points of view. As theorists we do not mind reducing its weight; provided it is made a token coin there is no objection in theory, but looking to the habits and sentiments of the people for the time being till they are familiarised with a full gold standard and a gold currency, till that time and during the transitional period the rupee need not be trifled with; there is no necessity to trifle with the rupee. (*Mr. Wadia.*) But I take it the Chairman is not thinking of this transitional period.

4266. In my own mind I was making a contrast between a full gold standard and an exchange standard?—(*Mr. Wadia.*) By the time a full gold standard comes into operation they will have become so used to the new currency that we may expect to see a difference in their attitude with regard to the token money.

4267. I fully apprehend your point of view, that after a sufficient period of getting used to the new conditions you might with safety make such a change, the only question being the adequacy of the intervening period for accustoming the people to the new state of affairs. We come now to your analysis of the imperfections of the gold exchange standard (paragraph 20), one of which we have already dealt with, and we will now deal with the contractibility of the currency under a gold exchange standard. In paragraph 2 of your analysis you refer to the evils of an inelastic currency which are accentuated by a system which leaves the management of currency in the hands of a body which is not in touch with the day to day requirements of the commercial community. Referring again to those hypothetical proposals which I believe you have had an opportunity of considering, would, in your opinion, this obvious disadvantage of the pre-war system be adequately remedied by the transfer of the management and the control of the currency of the country to the same body as that which controls the banking reserves of the country, that is, through a Central Bank?—(*Mr. Wadia.*) Provided two conditions are fulfilled on which we very emphatically lay stress, and these are, that we have an effective gold standard and that the Imperial Bank be considered a national asset with no private interests conflicting with the interests of the country as a whole.

4268. Will you explain a little the bearing of your last answer? When what we are seeking to remedy is the divorcement between the control of the currency reserves of the country and the banking reserves of the country, what difference does it make as regards the alleviation of that evil whether the system actually in operation be an exchange standard or a full gold standard?—(*Mr. Joshi.*) Undoubtedly it would be an improvement upon the existing system. But that would not secure to India what she wants.

4269. I am only dealing at the present time with each evil under its separate heading?—It will be an improvement.

4270. Then at the conclusion of your paragraph No. 2 you say: "There must be something intrinsically wrong with a currency system that permits the bank rate to rise from 4 to 9 per cent. at a time when the country has an outstanding balance of several crores of rupees in her favour from month to month." I should like to direct your attention in that connection to the recent alterations that have been made in India's banking and currency system as regards the issue of emergency currency against bills and ask you to what extent, in your opinion, the inelasticity to which you refer has been remedied by that innovation?—This defect has been removed partially by this innovation. But to remedy this defect completely, unless the country adopts an effective gold standard the provisions for emergency currency will not be sufficient to make the system so elastic and so stable as not to lead to violent fluctuations in future.

4271. As regards this particular provision for the issue of emergency currency against bills of exchange, will you point out what difference it makes to the fundamental system whether it is an exchange standard or a full gold standard?—In a full gold standard people can go to the mint and get as much currency minted as they like. When the country has got a favourable balance it can be liquidated in specie and coin, people can go to the mint and get as much currency as they like.

4272. What would they tender?—They could tender gold.

4273. Just to make that clear, under an exchange standard can they not equally tender foreign exchange and receive internal currency?—(*Mr. Wadia.*) You mean they will receive token money.

4274. They would receive whatever unit of currency the country has?—Under the gold exchange standard they will get silver, notes printed on silver.

4275. Under your system what would they get?—Gold coins or gold notes.

4276. But whether the system was based upon a gold currency or upon an inconvertible internal unit the measure of elasticity would bo the same, would it not?—There is ultimately all the difference in the world between an inconvertible silver rupee and the convertible gold note or coin.

4277. In this connection, referring only to the question of elasticity, I feel that my mind needs to be cleared as to what the essential difference is between the two?—(*Mr. Joshi.*) This statement is made from our experience of the last two or three years. India had an enormous balance in her favour and it was simply the exchange policy of the Government which

kept up the statutory ratio of the rupee at 2s. which was responsible for the import of heavy stocks of gold into this country and at same time for the phenomenal tightness of the money market. Under the operation of a gold standard system open to the free coinage of gold, this gold would have found its place in the vaults of the bank or in the mint and people would have got as much money as they desired.

4278. I think we must distinguish, must we not, in this connection between the regular annual and gradual expansion of the currency which is required by the growth of the trade of the country and the seasonal expansion which is required annually to be followed by a subsequent contraction. I think I could ascertain your views best by asking you whether the arrangements for the seasonal expansion of the currency against bills of exchange at present in force are not equally adaptable, whether the fundamental system of currency be an exchange standard or a full gold system?—Under the gold exchange standard, provision for emergency currency is an improvement; it is an important innovation; under a gold standard it is better.

4279. Continuing your memorandum in paragraph No. 3 you say: "This mechanism for stabilising exchanges can only be effective if there is legal obligation on the Government of India to convert rupees into gold"?—This statement is made to point out that the Indian system was not a complete gold exchange standard.

4280. That will save me troubling you with further questions on that point. That is really only pointing out that the pre-war system was not a gold exchange standard. Now, in paragraph 4, you say that India needs all the gold which she can possibly command for the development of her agriculture and her industries. I am not quite sure that I perfectly appreciate what you have in mind there. Is gold in use as currency available for the development of agriculture and industries?—(*Mr. Wadia.*) What we meant to say was this: under a gold standard all the gold reserves will be economised and centralised, and on the basis of that a credit superstructure may be raised for the benefit of agriculture as well as industries.

4281. Let us agree that in the past all the gold resources of India have not been mobilised centrally and thus made most readily available. What I need to supplement that, in order to compare in my own mind the comparative advantages of an exchange standard and a gold standard, is to see why, under the full gold standard, it is your opinion that you would attain a greater measure of centralisation of gold resources and their mobilisation for purposes of industry in consideration of the fact which would seem to require consideration that, under that standard, you have a proportion of your gold out in circulation, and thus it would seem not available?—The great defect of the gold exchange standard as we have indicated, is the dissipation of India's gold resources from year to year. All the gold that comes here is either hoarded or disappears. Under a full gold standard much of this gold will be centralised for the raising of credit.

4282. Were the possible evil effects to which you refer due or not due rather to a misapprehension of the proper working of a gold exchange standard or were they the results of an intrinsic defect in the standard itself?—(*Mr. Wadia.*) People have no confidence that the gold, once they part with it, will come back to them, and this is one of the main psychological springs of the present habit of hoarding.

4283. That I understand to be one of the bases of your recommendations?—(*Mr. Joshi.*) May I supplement that answer? It was partially due to the intrinsic defect of the gold exchange standard system itself, because so far as India is concerned it necessitated the location of 40 million pounds in London. Under a full-fledged gold standard there is no necessity for locking up all India's gold reserves in London. That is one defect; there is another; that so far as the people are concerned, they are not the only hoarders; the Government has become one kind of hoarder, and the people another kind of hoarder. So India's gold reserves as well as resources are not utilised to the fullest extent to which they ought to be utilised.

4284. That is the point which really comes in your next sentence, where you say "This dissipation of the gold resources is brought about in a two-fold manner: firstly, nearly £60,000,000 worth of her gold including £40,000,000 in the gold standard reserve is locked up in London for the stabilisation of her exchanges." When we are considering the availability of gold for the purpose of development of agriculture and industries, if it is to be locked up does it make any fundamental difference whether it is locked up in one place or another?—(*Mr. Wadia.*) If it is used or locked up in a central bank which acts both for the purpose of the paper currency and for banking purposes, it means that all this gold will be the basis on which the bank will extend its credit whereas at present nothing of the kind can happen. That is one great advantage, that by the centralisation of our gold resources and by placing them in a national bank, we shall be able to make more use of these gold resources for our national purposes.

4285. If you have assets in the paper currency reserve to protect the internal convertibility of notes and to maintain the exchange value of internal currency, then they are counterbalanced by liabilities upon the other side of the balance sheet, are they not? If that is so, how could they be available for further purposes of credit?—(*Mr. Joshi.*) May I answer that question? There are really two answers: first so far as the £60 millions are concerned, these reserves are locked up to-day in London simply because of the existence of the gold exchange standard. Now, we make the point that had it not been for the operation of the gold exchange standard this £60 millions would have been in the central bank in India, that is to say, the State Bank. That is one thing; in another way the large stocks of gold which are imported into this country now are hoarded by the people, and they will be available to the banks; and upon these gold reserves and resources a credit superstructure can be raised up to help industries and agriculture.

4286. Under a full gold standard, as I understand it, we recognise that a paper currency reserve must still be maintained?—We endorse your view on that point.

4287. And this reserve will have to bear the weight of maintaining the external value of the currency?—It will be kept in certain proportion.

4288. Do you think it will be possible to make any great reduction in that proportion in view of the gold in circulation?—That is not a question of the paper currency reserve. We do not trifle with the paper currency reserve; we are equally emphatic as you are in maintaining a paper currency reserve.

4289. May I direct your attention, in order that we may proceed step by step, to the end of my question: that is, agreeing on that (there can be no two opinions about that of course), are you or are you not of opinion that you can make a substantial economy of the reserves which you would have to keep in consideration of the gold which you have in circulation?—Exactly; that is the point we are making, that under the gold exchange standard it is not possible for us to make economy in the use of gold, and we believe that under a gold standard there is a greater opportunity to make greater economy of the use of gold.

4290. As I understand it, your opinion is that that economy is effected by reckoning that gold in circulation is available as part of your reserves?—That point does not arise. All that we mean to say is that to-day the large stocks of gold which are imported into the country are put out of use. Under a full gold standard the people will not hoard gold, and these will be deposited with the bank, and on the strength of those deposits the bank can lend out credit either to agriculture or industries. At the same time there will be no necessity for locating £60 millions in London.

4291. That is proceeding upon the assumption that the adoption of gold currency and a full gold standard will remedy the hoarding practice of the people?—Decidedly; and there is just one more point; the adoption of an effective gold standard does not necessarily mean the circulation of a large number of gold coins.

4292. Let me examine just what your anticipations are about that. Do you, for instance, consider that the introduction of your proposals would produce an immediate cessation of the hoarding habits of the people, and that in consequence no gold will be required at all either in currency or in substitution for hoards?—(*Mr. Wadia.*) No, not necessarily.

4293. So I imagined. You look upon it as a circumstance which will produce a gradual change?—Yes.

4294. Do you or do you not consider it is probable that the result of making gold freely available would, at first at any rate and during the transition period, result in a further substantial increase in the demand for gold both for currency and for hoards?—I don't think I am prepared to give any definite reply.

4295. I beg your pardon, I misunderstood your gesture. It is not that you differ from the suggestion, but that you cannot make any prophecy. Nevertheless, it is a very relevant matter for consideration, as regards the advisability of any practical course, as to whether this is going to result in an immediate demand?—(*Mr. Joshi.*) There may be some demand immediately for more use of gold, but at the same time if simultaneous steps are taken to alter the system, there is also the possibility of finding more gold offered to the mint. To-day persons have got gold not because they are genuine hoarders but because of the uncertainty regarding the currency policy of the Government of India. And I may go to the length of anticipating further tender of gold by the people to the Government.

4296. That is the ultimate state of affairs at which I understand you expect to arrive, but my present question is directed to trying to ascertain what is going to happen immediately?—Even immediately; this phenomenon may arise.

4297. Then you are not unwilling to contemplate the probability that there might be, on balance, an actual return of gold as the result of the introduction of your proposal?—There is a possibility in both directions.

4298. And as between the two possibilities you agree, no doubt, there is a very serious practical matter for consideration in contemplating what course should be taken. Do not you think it would be possible to decide whether it is likely to result in an increase or a decrease in the demand for gold?—But we do not contemplate the conversion of the rupees into gold immediately. We are suggesting permissive measures which are to be adopted in future.

4299. Let us postpone that question for the moment, until we come to the actual measures. Continuing to ask my elucidatory questions upon your analysis of the question, and passing to paragraph 22 you say:—"In normal years she has to receive and not pay gold. Even if there is an adverse balance, it can be adjusted by the operation of the bank rate or by the flotation of a temporary loan abroad." Now, the occurrence of an adverse balance would mean, in fact, a bad year, during which conditions were adverse from the Indian point of view, and, if those adverse conditions were sufficiently adverse, it might amount even to a crisis in India's financial affairs. Is a period of crisis of this sort, or at any rate an adverse period, a season at which it is prudent to leave oneself with the task of the flotation of loans abroad as a method for dealing with and rectifying the situation? Ought one to adopt a system where one has to borrow at times of crisis, or is there not something imprudent about that?—(*Mr. Joshi.*) As a matter of fact, during a crisis it is only one of the ways for bringing out equilibrium, and if the crisis is of a local nature, there is no difficulty in raising a foreign loan.

4300. Critical times, one has to recognise, affect the national credit, and a prudent Government does not put itself, does it, in the position of having to borrow at a time when, *ex hypothesi*, its credit is bad?—(*Mr. Joshi.*) But so far as my knowledge goes, there is no Government in the world which takes the obligation to provide for adverse circumstances. It is the business of the business community and the banks to cover up all transactions, and I do not see any Government in the world which undertakes such an obligation to provide for adverse circumstances.

4301. That is rather a wider answer than an answer to my particular question. I had no doubt in my own mind that I stated the question in a manner in which you would probably agree with it?—We agree with it. There are cases in which it is imprudent to resort to foreign loans.

4302. You refer to the circumstance that the operation of an effective discount rate under the gold standard with a centralised reserve is to be taken into account as a method of remedying any possible upset in the balance of trade. It would be of great interest, I think, if I might ask you here a question on which the Commission needs enlightenment, and that is as to what extent the discount rate in India, with its admittedly undeveloped banking system, is an effective method for remedying temporary maladjustment in the balance of trade. I think you will agree that in a country like Great Britain, with its highly perfected banking system, subject to such abnormal periods as that of the war, it is an effective means of restoring the balance. How far can we contemplate it as an effective instrument for that purpose in the Indian economy?—(*Mr. Joshi.*) For the time being it will not be as effective as it is in Great Britain. But we contemplate that in time under the gold standard system it will be gradually made as effective as it is in other countries.

4303. That must be, as I understand it, only in proportion to the development of the banking system in India?—(*Mr. Wadia.*) Yes.

4304. What is your opinion, Professor, as to the rate of progress which you think might be anticipated in India as regards the habits of the people and the use of banks? Is it a thing in which we can look for a swift and speedy growth?—Well, there is every possibility of banking becoming more popular if effective methods are taken for bringing banking within the reach of the smaller towns.

4305. But it is not going to be the growth of a day?—No. But even the use of cheques in the vernacular may give such a powerful impetus to banking habits that you can say nothing as regards the possibilities of banking in the future.

4306. It is a matter, of course, in which one is peculiarly in need of enlightenment as to the extent to which it is possible to look forward to improvement. It is a matter in which, I take it, we are peculiarly in need of enlightenment as to the extent to which it is possible to foresee in the near future the education of the cultivator in the habit of keeping his savings in the bank and using a cheque to draw upon them?—(*Mr. Wadia.*) The Indian cultivator is an exceedingly intelligent man. He can be easily made to learn the use of cheques if only facilities are brought within his reach. We have full confidence in the general intelligence of the average Indian cultivator.

4307. This really raises the question (which is perhaps a little foreign to the proceedings of the moment) of the methods for increasing banking facilities and encouraging confidence in the stability of banks?—(*Mr. Joshi.*) Yes, Sir. As a matter of fact, we contemplate all these measures together, as part and parcel of one complete scheme. We go further and say banking includes monetary progress and savings.

4308. In paragraph 27 of your memorandum continuing our present line of inquiry, you caused some temporary doubt in my mind by your reference to the circumstance that the best interests of India require a currency system that the rest of the world has already accepted, a gold standard pure and simple. In what sense can it be said that the rest of the world has accepted a gold standard pure and simple? A characteristic feature of the gold standard which we are considering is a gold currency. Is that the case with regard to the rest of the world?—By a gold standard pure and simple we mean not the actual extensive use of gold in currency but a system under which the media of exchange can be ultimately converted into gold.

4309. For international payments?—For international payments and also for internal payments.

4310. If it is converted into gold for international payments that is the gold exchange standard; but if it is to be converted into gold for internal payments, in what sense can the rest of the world be said to have accepted that currency system? Is it not rather a feature of modern times that the reverse is the case with the nations of Europe?—You are talking of post-war conditions?

4311. If you please. I am talking of the present? —That is because there are a large number of countries in Europe which cannot afford the gold for internal circulation—quite apart from the issue of economising the use of gold.

4312. That really brings us back to your original answer, which we fully comprehend, that the rest of the world would adopt a gold currency if they could have it?—Well, we have learned to economise the use of gold even under a gold standard and the war experience and post-war experience has been increasingly in that direction.

4313. Perhaps you will recognise also that that is a point of view which might not meet with acceptance amongst many authorities in the countries of western Europe, who would perhaps be rather inclined to contend that they look upon the exchange standard which they have adopted as the more scientific standard, and one which involved no implication that there was any intention whatever of returning to a gold currency?—You cannot get behind the simple fact that the more confidence people have in getting their media of exchange ultimately converted into gold the greater will be the ease and readiness with which they will use those substitutes.

4314. We are coming to rather closer quarters now with your proposals for the actual attainment of the full gold standard. You open the matter by your reference in paragraph 28 to the circumstance that India, like the United States of America, can demand the import of enormous quantities of the precious metals. We have referred before to the circumstance that the apparent favourable balance of trade is made up partly of invisible imports, of home charges, and partly of the present actual imports of gold. Will you explain to me by what methods India can enforce her demand for any further amounts of gold required in excess of the present imports?—(*Mr. Joshi.*) Our past experience during the last 20 years, if you study the statistics of the imports, show that much more gold will not be required for the successful working of the gold standard, and we anticipate that under the gold standard this gold will not be put to any unproductive uses and will be available for purposes of currency and in that sense we make the statement that India can command gold.

4315. I understand then that, for the purpose of introducing a gold currency, you think all that would be required would be that India should continue to import the gold which she has been importing lately and that these quantities would then become available for currency?—In future, by the utilization of the present reserves, supplemented by future imports and also supplemented by the existing stocks which may be available.

4316. I do not quite follow what you mean by the utilization of the present reserves. In what manner would you utilize these?—In paragraph 34 we come to concrete proposals. That proposal has got a reference to the proposal which is submitted to us for a gold standard and we are discussing it in connection with that.

4317. I think I can put the point in this way. If the gold which is now imported is being used for some purposes for which it is required, is there any reason to suppose that it will not continue to be required for those purposes and would become available for some other purposes?—We do not subscribe to the view that the whole quantity of gold imported is used for non-monetary purposes. At present it is used that way, good deal of it is hoarded.

4318. It cannot be used for monetary purposes at present because of the 2s. ratio. I should like just to understand why it is you think that it would not continue to be used for the purposes for which it is now being used, and, if so, if you could assist us by telling us in what manner it would become available as currency?—The habit of hoarding has grown during recent years simply because of the defective currency system. Another thing is that we anticipate a good deal of education among the people because we are expecting another instalment of political reforms. That will facilitate the education of the people in banking facilities and they will be prepared to part with their gold which may then be put to productive uses instead of being hoarded.

4319. If they need the gold at present to hoard and if they cease to hoard gold, will they not need something else to hoard?—They do not want to hoard, Indians do not want to hoard it; if they do so, it is because there is no other way. (*Mr. Wadia.*) I think that is too large an assumption that all the gold imported into the country is required for non-monetary purposes.

4320. At present it is impossible to make any other assumption?—Much of it may be lying idle. With a gold mint and a gold standard, a considerable portion of it may come back.

4321. Now let me come to the actual practical steps which you desire to recommend. Your first proposal is that "no fresh additions to the currency to be made in rupees or rupee notes; all such additions to be in the form of gold notes or gold certificates. Thus no immediate additions to the currency in the shape of gold coins will be necessary nor will it be necessary to convert the existing stock of rupees into gold." Is that qualified by any provisions as to subsequent action, or is that only an intermediate stage?—That is only an intermediate stage.

4322. Then your second proposal is that "so long as this country has not built up adequate gold reserves . . . . it is not necessary to make the existing token currency convertible into gold for internal purposes." That implies, as I understand, that as soon as you have built up adequate gold reserves, you would make the existing token currency convertible into gold for internal purposes?—Yes.

4323. So that you are contemplating some future period at which rupees will become convertible into gold. Do you contemplate as a concomitant of that step that the rupee should cease to be legal tender except in small amounts?—Well ultimately if the rupee is to be made a token coin, then a legal tender limit must be fixed.

4324. In substance, the scheme which you contemplate bears a resemblance in material matters to that scheme which has been outlined in this memorandum* which has been placed before you?—In studying this memorandum we find that there are two or three omissions to which we may draw attention. There is no reference in this memorandum under the gold standard to the establishment of a mint. Then there is no reference also to the fact that the Government should undertake not to coin any more rupees, and there is also no reference to the fact that if the Imperial Bank of India is to be made the central reserve, is to be entrusted with the central reserve and also entrusted with the management of the paper currency, it should be done only after making it a national institution.

* See Appendix 2.

4325. There should be some alteration in the constitution?—Yes.

4326. With these omissions then, as I have been able to follow your proposals, as regards the general principle your proposals are really substantially the same as those in this scheme outlined in this memorandum?—Yes.

4327. I have only one or two general questions to ask you upon some important aspects of that subject. Have you been able to make any estimate of the additional amount of gold, additional that is to the amounts which come here, which it would be necessary to draw to India in order to carry out this scheme, including the acceptance of the obligation to give gold against outstanding rupees?—We have got here some details of the way in which complete conversion can ultimately be worked out, and if you will permit us to enter into those details, we want to show that even to-day it is possible to have complete conversion of silver currency into a full gold currency; even to-day it is possible to do that; but we do not wish to advocate that for obvious reasons. What we mean to say is that we have got reserves enough to-day to convert our present currency into a full gold currency.

4328. As this is the question to which I was directing your attention, we might have the benefit of your calculations?—Well we have figures of the total circulation of rupees and notes for 1919, approximate, 362 crores, going back to 1919, rupees and notes, silver and notes.

4329. (*Sir Alexander Murray.*) Active circulation? —Yes.

4330. (*Chairman.*) How much of that is rupee coin and how much is rupee notes?—That we cannot say; we have got the total figure here. Then 80 crores have been added between 1919 and 1924—that we have gathered from the tables that you have supplied.

4331. That is rupees and notes?—Yes. So in all our total circulation to-day is 442 crores; roughly, we say 450 crores. Out of these, 190 crores are in notes and 260 crores in rupees. Well, as against that we have 22 million pounds of gold at 10 to 1, and 23 million of securities in the paper currency reserve; in all 45 million in the paper currency reserve; that is equivalent to 67 crores at 15 to 1. Then we have in the paper currency reserve 58 crores of Government of India securities to-day. Now we take it that it is only a question of renaming these securities, if you are converting them into gold securities, once you have a gold standard. You have 58 crores of Government of India securities and if we have a gold standard and all our reckonings are to be in gold then we can republish those securities and call them so many crores of gold mohurs.

4332. You can call them anything which you choose to call them: that will not alter their nature?—If our standard of money is to be changed, the denomination of our securities will have to be changed. If they are rupee securities so far, when you have a gold standard they will become gold mohur securities; we will revalue them in gold.

4333. The nature of your securities cannot alter?—We are simply renaming them.

4334. So we have in that way 67 crores of gold and sterling and 58 crores of debt from the Government of India?—Yes.

4335. That makes 125 crores converted into gold. The total note circulation is 190 crores. If you deduct from that the 125 which we can convert immediately into gold, you have left over 65 crores. Assuming the conversion of part of the note issue into gold, assuming that the notes are presented for gold, you are calculating that you could convert, if you are required to do so, 125 crores of your 190 crores into gold. It is not still quite clear where the gold comes from which enters in as part of the 58 crores of Government securities?—These are Government of India securities and they are at present defined as rupee securities because our standard is the rupee. If our standard is henceforward to be the gold mohur, then those securities have to be revalued in gold, renamed in gold.

4336. My difficulty is this. Here you have your 22 millions of actual gold coin, which you can use. Here you have your 23 millions of sterling securities, and you can sell them, and I hope you will realise good prices. But what about the 58 crores of debt from the Government of India? Where is the actual gold to come from there?—(*Mr. Joshi.*) It is not to be paid; it is the public debt. The holders of the rupee securities will henceforth be holders of mohur securities; that is all. Instead of one man holding Rs. 15, as a holder of the debt from the Government, he will be the holder of one mohur security.

4337. The basis of our enquiry at present is to try and find out where you would get the gold metal from?—(*Mr. Wadia.*) We are trying to point out to you that the whole conversion can take place. Then, we have 260 crores of rupees in circulation. We say roughly that 200 crores out of this will be actually required as token money. It is a rough estimate. We need not convert 200 crores. That leaves us 60 crores of rupees to be converted, plus the 65 crores of rupee notes.

4338. What is the 65?—190-125. So in all, 125 crores of rupees and notes will have to be converted.

4339. That is, you are allowing for the continuance of no notes in circulation at all?—That is what we have provided for, when we say that these 58 crores of rupees securities can be converted into mohur securities on the basis of which a certain amount of note circulation may be fiduciary. That is what we have in mind.

4340. Now I follow you; a fiduciary issue of 58 crores?—Then we require to convert 125 crores of rupees and notes.

4341. That leaves only 58 crores of note circulation outstanding?—As against that there will be the banking securities, the mohur securities. Well then, we require to convert 125 crores. As against that, we have 40 million pounds of the gold standard reserve and 90 crores of rupees in the paper currency reserve and, in addition, 60 crores of rupees in actual circulation; so that we have in all 40 million pounds, that is, 60 crores, plus 90 crores in the paper currency reserve, plus 60 crores in actual circulation. Thus to convert 125 crores into gold, we have 60 plus 90 plus 60, that is 210 crores.

4342. Such a calculation, of course, is not very simple to follow by word of mouth. Perhaps we may have the benefit of a note from you which will give us an opportunity of considering it in detail?—We can write out a note.* We only point out that we have reserves enough for a complete and immediate conversion of the gold exchange standard into gold standard.

4343. That is the deduction which you would draw from the calculation which you have just handed to us. The basis of that calculation we shall be able to judge better when we have considered it at leisure with figures in front of us. There is only one further question which I want to ask you, taking full advantage of your presence here to-day, and that is this: You say in No. (4) (paragraph 34): "The relation of the rupee to the standard coin to be defined by law, preferably as 15 to 1." Let me ascertain, in the first place, whether this is to be an immediate measure or whether this is to be a part of the further action to be taken on the accumulation of sufficient reserves?—As an immediate measure.

4344. What provision do you make for the maintenance of any ratio which is to be immediately fixed in your scheme?—An undertaking on the part of the Government not to coin any more rupees.

4345. You suggest no obligation to buy or sell either gold or foreign exchange, in order to maintain the ratio of the rupee?—No. (*Mr. Joshi.*) There will be no question of the ratio of the rupee, because our standard will be gold standard.

4346. It will not be a gold standard until you get on to the final stage. Now I want to contemplate the immediate action to be taken while you are

* See Appendix 21.

awaiting the accumulation of a reserve sufficient for the final stage. I understand you to say the ratio should be fixed at 15 to 1. It occurs to me to ask what mechanism you recommend in order to maintain that ratio, and you say there should be the provision that no further rupees should be coined? (*Mr. Wadia.*) What do you imply by "maintaining the rate"; is it for internal purpose or for external purpose?

4347. External purposes need not concern us?—For external purposes the question need not arise, because the exchanges may be left to themselves with specie points.

4348. I am not sure I have perfectly apprehended your last answer. The unit is to be the gold mohur; that is, you fix the gold mohur as identical with the sovereign, and you say that the ratio would be 15 to 1. But it is not enough to say what a thing is to be. What means are you going to take of directing the supply or the demand for conversion of internal currency into external in order to secure the maintenance of the ratio which you have fixed? Do you popose that there should be a legal obligation in your transition period upon any currency authority to buy and sell at gold points corresponding to this ratio?—(*Mr. Joshi.*) Yes; the Government shall undertake the obligation to give for external purposes gold in the form of bars, say, of 100 oz.

4349. And that is to be immediately fixed at 15 to 1?—Yes.

4350. Now we come to one question which I can put quite generally. Why do you prefer the ratio of 15 to 1 to the rate which you find existing at the present time in the exchange market, that is, the 1s. 6d. rate?—(*Mr. Wadia.*) The present rate has been the result of Government policy during the last year as against the 1s. 4d. rate, which has become almost sanctified by custom. (*Mr. Joshi.*) 1s. 6d. rate is only the result during the last 12 months; and as against that we have got the experience of nearly 30 years and in currency matters public confidence ought to be considered very carefully; and people are accustomed to that relation. (*Mr. Wadia.*) In theory, it does not matter. As a matter of pure theory, if the rupee is a token coin, it does not matter what ratio there exists between the token coin and the standard coin. But in practice the people have been so long accustomed to this 1s. 4d. or 15 to 1 rate that it is not desirable to change except for very grave and serious reasons.

4351. If I follow your contention it is this. Supposing you were at once to introduce a gold currency and to adopt the gold mohur, making it the standard coin of the country, the present rate of exchange in the market being 1s. 6d., it will be perfectly indifferent whether, upon the introduction of the gold mohur, you fix the ratio of the rupee as 15 or as 13⅓ to the mohur?—We have answered that question of gold exchange that two conditions are necessary to maintain the ratio.

4352. Indifferent as regards any relations between debtor and creditor, buyer and seller, and so on in the country?—(*Mr. Joshi.*) We are fully conscious about the disturbances which may result from this; but those disturbances may be tolerated in view of the reform and the overhauling of the whole currency system in India.

4353. That raises the question, which I have no doubt you have considered, whether prices in the country have settled down at this current rate of 1s. 6d., or whether they have not settled down at that rate?—(*Mr. Wadia.*) If by prices having been settled down you refer to the prices of last year, undoubtedly that statement is true. But India has undergone so many sacrifices with regard to her price level in the past that we are quite prepared to face another disturbance of a temporary character if we can get what we want.

4354. To make it perfectly clear, I understand it is your opinion that there is greater equity in the ratio of 15 to 1 than in any other ratio?—Yes.

4355. To weigh that opinion, we must know as to whose equity it is, whose right, as it were, whose interests have got to be vindicated by the 15 to 1 ratio rather than any other ratio? (*Mr. Joshi.*) It is equitable on the whole and conducive to the welfare of all sections of the community.

4356. That, of course, is a very inclusive answer. Might I suggest to you that the only persons whose interests can be affected by a divergence from the old 15 to 1 ratio are parties to contracts which were made under the 15 to 1 ratio and which are still in existence at the present time? Are there any other persons, in addition to that class of parties to such contracts, who have got an equitable right to the ratio of 15 to 1?—By allowing the ratio to settle down at 1s. 4d. may benefit all the sections of the community, we should not forget that during the transitory period India is an exporter and she exports more than she imports and if the ratio at 1s. 4d. is fixed the country as a whole will benefit. Undoubtedly there will be parties which will be at a loss, as, for example, Government.

4357. I gather from your last reply that the opinion you express is that the interests of India are better served, as between two stable ratios, say 2s. or 1s. 4d., by the lower ratio rather than the higher?—(*Mr. Wadia.*) There is no question of the interests of India being served by a lower ratio, because that brings in the question of the gold exchange standard. As soon as the rupee becomes a token coin there is no question of that kind arising.

4358. I think we have already established it as your opinion that the period of transition, from whatever rate rules on a given day to some other ratio, involves a disturbance?—Yes.

4359. I may take it then, to conclude my questions on this point, that you are of opinion that, whatever disturbances in prices, in wages, or in the relative burden of contracts are involved in a transition from the existing ratio, which is about 18d., to some other ratio such as that which you prefer, are not to be considered against the equitable rights which are involved in the restoration of the 15 to 1 ratio?—Yes.

4360. One final question. In this matter the past is not a record of a stable 1s. 4d. ratio followed by a transition to 1s. 6d. We are looking back across a period during which the ratio has violently fluctuated?—Yes; as the foreign exchanges of the European countries fluctuated.

4361. In view of the complete upsetting of all such rights and equities as those to which you have referred and the violent fluctuations during that period, do you think that the difference between 1s. 4d. and 1s. 6d. is a matter for substantial consideration?—Yes, it is.

4362. (*Chairman.*) That finishes the questions I wanted to ask. There are many other matters that might be dealt with; but we have to recognise that this is an almost illimitable subject with many branching aspects.

4363. (*Sir Reginald Mant.*) Professor, you said just now that you would return to the ratio of 15 rupees to the pound, because the people had been accustomed to it for a certain number of years. What exactly do you mean by that? Do you mean that the common people are in the habit of thinking of the rupee as one-fifteenth of a sovereign?—(*Mr. Wadia.*) All those who are interested in the exchange.

4364. But the great mass of the people are not interested in the exchange, though they are largely affected by it; and I want to know in what way, as you say, they are accustomed to this ratio, and therefore it is right to return to it. You are aware, I think, that gold is circulated only to a very limited extent over limited areas and over short periods of time. What percentage would you say of the people of Bengal have ever seen a gold sovereign or a gold mohur?—(*Mr. Joshi.*) But on the whole people are familiar with the phenomenon that fifteen rupees can be got for a mohur, and in that sense we mean people are familiar with these relations.

4365. But are they familiar with it? Does the average ryot believe that he could get a gold mohur for fifteen rupees?—Because incomes are so low here. That does not mean people are not familiar with the fact. (*Mr. Wadia.*) In the Punjab he does.

4366. In the Punjab he may, but I ask you what percentage of the people in Bengal have ever seen a gold coin?—(*Mr. Joshi.*) From that point of view 90 per cent. of the people of India, because their incomes are so low, have not seen gold mohurs.

4367. Then how does the argument that they are accustomed to this ratio prevail?—(*Mr. Joshi.*) Because they know.

4368. (*Sir Maneckji Dadabhoy.*) Are you in a position to throw any light on what it will cost the country to go in for this complete conversion?—(*Mr. Wadia.*) Those are the very figures that we have brought up before.

4369. The actual cost to the country?—(*Both Witnesses.*) There will be no cost.

4370. In this experiment there will be no actual cost incurred; am I to understand that?—(*Mr. Joshi.*) Yes. (*Mr. Wadia.*) Except such loss or such cost as may result; it is not a real loss, but a loss on paper from the conversion of 210 crores of rupees into gold.

4371. So it would only represent a paper loss in your opinion?—(*Mr. Wadia.*) Yes, it comes to that. All those are the assets of the Government of India.

4372. (*Sir Henry Strakosch.*) There are a few questions I would like to ask you. I understood you to say, Professor, that for the last 80 years gold prices had been rising. I have before me a statement which can be verified which shows that gold prices have fallen steadily from about the year 1873 to about 1895?—(*Mr. Wadia.*) Yes.

4373. From that stage onwards they have steadily risen?—(*Mr. Wadia.*) That is why I said judging from the trend of gold prices as a whole.

4374. But we have the period of 1895 onwards where gold prices have risen steadily by a matter of 25 or 30 per cent., whereas they had fallen by about the same percentage, if not more, from the year 1873 to 1895?—(*Mr. Joshi.*) To that extent we qualify our statement.

4375. Then I have another question. You said that one of the disadvantages of a gold exchange standard is that in spite of a favourable balance of trade the country may at certain times be inconvenienced by exceptionally high money rates. You ascribe it, I believe, to the gold exchange standard?—(*Mr. Joshi.*) As it has operated during the last three years in particular.

4376. That, you think, would be remedied by the introduction of a gold standard?—Yes.

4377. Well, you have no doubt followed very closely the experience of other countries, including the United States, and you will probably remember that in spite of a full gold standard being installed in the country it nevertheless went through very severe money crises in spite of the fact that they have had a very substantial balance of exports over imports. I need only refer you to the crisis in 1907 and in earlier years when, as I say, they had a heavy balance in their favour, a complete gold standard installed, and yet suffered money crises with very heavy rates of interest?—(*Mr. Joshi.*) That phenomenon may be repeated in India.

4378. I understood you to say that in your opinion an effective gold standard would remedy that?—(*Mr. Joshi.*) It is a better system than a gold exchange standard, and it would provide the country with a system of currency which can meet the crises in a better way than a gold exchange standard.

4379. But I have endeavoured to show you that with such a currency the United States were subject to enormous crises and very frequent crises; so actual experience does not support your contention?—(*Mr. Joshi.*) Well, we are all fallible human beings, and as yet we have not contrived a perfect system of currency. (*Mr. Wadia.*) If I may be frank, the present scarcity of money as indicated by high money rates, I mean by the rates during the last two or three years, we believe has been largely due to the policy of exchange at 1s. 6d., and we say under a gold standard there will be no more temptations before a human Government to manipulate exchanges and bring about an artificial dearth of money.

4380. May I put this to you? Can it be concluded from actual experience and also from the theory of the thing that the trouble of exceptionally high money rates, especially in times of great prosperity, is due to a faulty banking system, and that, when once your banking system is properly organised, that drawback will disappear?—(*Mr. Wadia.*) That is quite possible.

4381. And that that applies not merely under a full gold standard but also under a gold exchange standard?—(*Mr. Joshi.*) But that only strengthens our position that under the gold exchange standard a developed banking system will be a very good feature, but under an effective gold standard it will be a better provision.

4382. (*Sir Henry Strakosch.*) Thank you; I do not think we need discuss that further. I only wanted to make these two points clear.

4383. (*Chairman.*) On behalf of my colleagues I thank you for your very full and helpful assistance this afternoon.—(*Mr. Wadia.*) I take it that we have the permission of the Commission to publish either part or the whole of our memorandum?

4384. (*Chairman.*) The Commission does not make any objection to the publication of the memoranda of witnesses, although our own proceedings at the Commission will only be published with the report of the Commission.

(*The witnesses withdrew.*)

THIRTEENTH DAY.

Thursday, December 10th, 1925.

Present:

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Maneckji Byramji Dadabhoy, K.C.I.E.
Sir Henry Strakosch, K.B.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.

Mr. G. H. Baxter (*Joint Secretary*).

Mr. B. F. Madon and Mr. Lalji Naranji, with Mr. Mehta as Secretary, representing the Indian Merchants' Chamber, called and examined.

4385. (*Chairman.*) Mr. Madon, you come to-day to represent the Indian Merchants' Chamber?—I come with Mr. Lalji Naranji, one of our past Presidents; I happen to be the Vice-President at present.

4386. With you there is Mr. Mehta, the Secretary of your Association?—Yes.

4387. The Indian Merchants' Chamber has been good enough to provide us with a memorandum* setting forth their views, which will save us much time and discussion. I need only observe that the first portion of the memorandum deals with the constitution of the Commission. As notified by correspondence, that could not be accepted in evidence by the Commission or indeed appear on their records.—Quite, Sir.

4388. I will turn then, if I may, to the subsequent portion of your memorandum and I desire to ask you a few questions. Shall I direct them in the first place to Mr. Madon or to Mr. Lalji Naranji?—Any way you prefer. Mr. Lalji would like that I should answer and if we have anything on which we wish to consult each other, you will I hope permit us to do so.

4389. For your convenience I shall address my questions in the first place to Mr. Madon. I understand that the proposals set out in your memorandum may be summarised as follows: that there should be free minting of gold into sovereigns or mohurs; that a ratio should be established to the gold mohur of 15 to 1; that the rupee should continue full legal tender as at present, but that no further rupees should be coined; that notes should be encashed into gold or rupees at the option of the currency authorities; that no currency should be issued in future against anything but gold; and that the charge of the currency and the note issue should be handed over to the Imperial Bank of India, which should also conduct the remittance operations of the Government. That, I think, gives an outline of the proposals in your memorandum?—Yes, Sir; that is quite correct.

4390. Let me ask you one explanatory question. You propose that a part of the gold standard reserve should be transferred to the paper currency reserve and that it should be given a larger backing of gold, and that the remainder should be held in reserve to support the gold standard system?—Yes.

4391. What do you propose should be the arrangement as to the management of that remainder of the reserve?—Our Chamber would prefer the whole management of every kind of reserve to be in the hands of the Imperial Bank of India in the future, of course under such regulations and safeguards as the Government may think necessary to provide.

4392. In this connection the first question I should like to ask you will raise rather a new aspect as regards a question we have already had the advantage of asking you in another connection, and that is as to the position of the Imperial Bank under this proposed re-arrangement of control. You refer in your memorandum to the safeguards required and to the development of the Imperial Bank into a true central bank. Would you assist the Commission by amplifying what you have in your mind in that regard?—Well, Sir, what my Chamber principally have in mind is that if the currency department is handled by the Imperial Bank and regulations are laid down by statute as to how the various reserves are to be treated or dealt with, then there is no danger of these regulations being temporarily set aside as there has been in the past when the management has been in the hands of the Government, because the Imperial Bank would have to conform to the regulations laid down and if there has to be any setting aside of such regulations or some difficult situation that requires to be tided over, then it is not the Imperial Bank that could do anything of its free will, but it is for the Government to say that it has got to be done and that the Imperial Bank should do it; and that is what will in the opinion of my Chamber provide for the avoidance of manipulations for the normal period, if I may put it like that; when there is some abnormal situation like a big war or something of that kind going on, then most probably the Government will have to take some abnormal action; but it will not be the Imperial Bank that could do it of its own free will; it will have to follow the regulations and it will be for the Governor General in Council or whatever the authority may be ultimately governing the country to take the necessary action.

4393. Would you briefly outline the nature of the regulations to which you are referring?—The regulations have not been considered in detail and laid down by my Chamber.

4394. My question was rather not so much what the regulations would be as the sort of subject they would deal with?—Put that way, our feeling was that if the Imperial Bank took over the currency department as it now exists, and with the automatic movement of gold in and out at such ratio as is adopted by law for the standard unit, the Imperial Bank would have as the future currency department to simply carry out that work, to give out gold and take in local currency, or take gold and give out local currency at the rates provided by law; and there would be no discretion whatsoever necessary. So my Chamber when they considered this question, were of opinion that there would not be any very radical changes necessary. What will happen is that the agency will be the Imperial Bank carrying out the work of the currency department as a sort of agent of the Government and it might be remunerated by such reasonable sums as the Government may think necessary for the work that it does and the responsibility that it undertakes.

* See Appendix 22.

4395. Do you or do you not contemplate that the note issue should become the notes of the Imperial Bank or that they should remain the notes of the Government?—That point has not been categorically considered; but as far as I could gather the views of my Chamber would be that no change is necessary; the notes may continue as they are, notes of the Government of India, and managed by the Imperial Bank as agent for the Government of India.

4396. If the notes remain the notes of the Government of India, that means that the liability in respect of them is ultimately the liability of the Government of India; and that means also, does it not, that the assets against those liabilities, which are the reserves, must remain the assets of the Government of India?—I would put it somewhat differently; I would not say assets of the Government of India but assets of the currency department or the note issue department. Of course if such assets as that department holds fail, then ultimately the liability to preserve the value of the country's currency will remain the liability of the Government as in every other country.

4397. You agree that where the liabilities are, there must the assets be also? You could not say that the liability in respect of the notes was a liability of the currency department only, could you? It must be the liability of the Government?—I hope that follows from the way that we put it, that the Imperial Bank as far as the note issue work is concerned will be acting as the agent of the Government.

4398. When one is working out a practical scheme, is it logical to make a difference in ownership, as regards the vesting of rights and the vesting of liabilities against those rights?—I am afraid there is no such difference, because if the Imperial Bank acts as the agent for Government, then all the assets that belong to that department will belong to Government and all the liabilities will remain with Government; only the handling will be in the hands of an independent body.

4399. Your proposal, at any rate, is that the notes should remain the notes of the Government, bearing the name of the Government, and that whatever promise there is on them should be the promise of the Government?—As it stands at present; I may again repeat, we have not thought it at all necessary to make any change. So my Committee has not considered whether the future note should be the note of the bank or of the Government because the feeling was that the work to be done was to be done as agent of the Government.

4400. I am trying to explore what the actual working out of the scheme of agency would be. You propose that the reserves should be vested in the currency department. Is it your proposal that the currency department should be a department of the bank or a department of the Government?—Well, Sir, it will be a department of the bank, but absolutely independent of its banking department. The two will not be mixed up, and the profits or losses of the one will not be mixed up with those of the other.

4401. Let us distinguish between the separation as regards accounting and the separation as regards executive control. Do you propose that the currency department of the bank should be under an executive control different from that of the rest of the bank, or does your proposal as to separation only apply to the method of keeping the accounts on the two sides of the bank?—There again I may admit that we thought that details or some kind of a skeleton would be published for consideration of those bodies that come up for evidence; but there has been no such scheme put forward; we have not been able to examine each of these details separately.

4402. I am sure you would agree with me that it is so much a greater advantage to get the fresh ideas of witnesses rather than suggest ideas to the witnesses?—My point was this: we are quite prepared to give such ideas as we have on different subjects; but when it comes to a question of details it would certainly have helped those that come to offer evidence to have been told that this particular question would have to be considered, and they could come prepared to say which side of the question they were prepared to support. But if you wish it, Sir, I may put forward such views as I think my chamber would be willing to support, and that would be that so long as the accounts of the department were entirely separated and the Imperial Bank was handling the department only as an agent, there would be no objection to the executive control remaining in the same body, that is, under the Imperial Bank. There need not be a separate executive body to control the note issue work.

4403. I suppose practically you would see difficulties in making a two-headed institution that is capable of leading a healthy life?—Yes, Sir, all India is against dyarchy in any form.

4404. That being so, will you tell us what, in your opinion, is the reason for the desirability of maintaining the separation of accounts as between the issue department and the banking department of a Central Bank? We know the two systems, the British method of the issue department and the banking department separate, and the continental method of lumping the two together. You, I understand, express a preference for the separation of the two departments of the Central Bank?—Yes, Sir, as far as I can see my Chamber would be for following the model of the Bank of England rather than that of continental banks.

4405. What do you consider to be the particular advantage which makes the one preferable to the other?—Well, Sir, that advantage has been put by various speakers in England, including the Premier, as making the system fool-proof and knave-proof. Mr. Baldwin put it very recently in a speech.

4406. You think that stating in separate form the basis of the note issue shows in such a conspicuous and visible way to the public exactly how the note issue stands as to make it impossible for a fool or a knave, who either by folly or knavery muddles the system, to escape detection?—I may explain it a bit. It is not always knavery that does it. It is not always folly that does it. But in political matters frequently expediency is given far greater weight than correct scientific handling of a question, particularly currency questions. And a system like that of the Bank of England makes the system proof against even that kind of thing until Government does it in a way which makes it very clear to the public what is being done.

4407. Assuming the transfer on this basis, do you see any necessity for any changes in the constitution, that is the provisions as to the executive government of the Imperial Bank of India, and, if so, of what nature?—Well, Sir, the feeling of my Chamber which has been expressed on other occasions is that the constitution and control should be gradually more and more Indianised. We quite understand that you cannot do it in one day. But the ultimate goal that the Chamber would aim at is that the final control of the Imperial Bank, which would be practically the central state bank of the country, would be some day entirely in the hands of Indians.

4408. That is rather a question of direction of policy?—Yes, Sir.

4409. In the first place, I think we should try and find whether, taking the statutes of the bank as they exist at present, you consider that any change in these statutes is necessary, particularly with reference to the question of the amount and degree of Government control which you desire over the bank?—I believe, Sir, the present provisions are sufficient to give Government such control as would be necessary provided of course you accept the suggestion that I have put forward that the transfer of the Currency Department to the Imperial Bank would be to them as agents and not as owners of all the assets and liabilities. These gentlemen representing government on the board of governors would be always in touch with what was going on and would be always able to see that the Imperial Bank was carrying out its duties as it should and as laid down

by statute. So I don't think any extra Government control is necessary because then it would not be an independent private bank looking after the Currency Department but again Government under a different name which we wish to avoid. So I would not think any other control necessary, but if I may be permitted to put forward a suggestion this has, I may again repeat, not been considered in detail by my Chamber but I simply put it forward as what I consider most probably would be welcomed by my Chamber, namely that, if with the responsibilities of the Currency Department handed over to the Imperial Bank, it is found necessary to have a third managing governor—we have two at present—then the law should provide that at least one of these three gentlemen should be an Indian.

4410. Would there be any other changes in the constitution??—Until, Sir, either the Commission or the Government later on puts before the public the constitution as they want to frame it, it will be very difficult for bodies like us to say exactly where they would differ.

4411. If we are to frame suggestions for a constitution, we have to frame them on the evidence that is given to us?—The evidence that I have tried to put before you is that so far, apart from the two things that I have mentioned—*i.e.*, ultimate Indianisation and if there are three governors that one of the three should be an Indian—we do not think any constitutional changes necessary. If, when the regulations are formed for handing over the Currency Department's work to the Imperial Bank, there is found to be any difference of opinion, we could then put it forward because, without knowing it, we cannot do it. But, as we propose that the Imperial Bank should be only an agent as far as currency work is concerned, the question of constitution would not come in.

4412. You quite fairly say this is the chief alteration which suggests itself to you at first sight, but that of course one cannot pronounce that other alterations might not suggest themselves when one comes to consider completed proposals?—Yes, Sir, that is what I have in mind.

4413. A question upon which you lay a good deal of emphasis, I understand, in your present recommendations is the maintenance of adequate Government control over the bank. In western Europe one is used to the publicist taking rather the opposite view and deprecating any form of Government control over the Central Bank of issue. For our enlightenment, could you explain to us why we meet in your mind with a difference from what perhaps we are accustomed to as the common point of view of the publicist?—Well, Sir, what my Chamber have in mind is this, that the handing over of the Currency Department to the Imperial Bank is a very important matter and we are really taking a new departure in this country in this matter. We know that even the United States Government—a country where in matters of banking and currency they are certainly far more advanced than we are in this country—when they had to devise a new system, they considered it necessary to have very considerable control maintained on the whole system. I believe that control is even greater than what would come in under the suggestions that I have put forward earlier. But there is another thing, Sir. There is a fear in the minds of the Indian public that entirely divesting ourselves of all control might prove very risky, particularly when the Government is not a responsible Government.

4414. With that limitation of the functions of the Central Bank to which you have referred, what are the dangers which you fear?—Well, Sir, it is very difficult to say what the dangers are until you are faced with the circumstances, because in 1914 we would not have been able to imagine the combination of circumstances under which the various measures that had to be taken in the last ten years were taken. So until we have that combination of circumstances we cannot say exactly what is going to happen, and it is in the minds of my friends in the Chamber that it would be much safer to see that the control was there.

4415. You see, my chief difficulty is to apprehend this. What you chiefly deprecate is any form of artificial interference with the natural working of your currency system once you have got a system which you can trust?—Exactly, that is what they fear.

4416. Certainly to the outsider the question suggests itself: are not you much more likely to run the risk of interference if you keep Government which is political, control over your currency authority than if you make that currency authority an independent banking authority which is not subject to political control? You see the difficulty in the mind of the onlooker who is trying to follow your reasoning?—Yes, Sir, I can see that difficulty, but the only reply that I can put forward is that in this country we have to advance very much further before we can undertake the experiment of absolutely independent banking control as you have in England. We would prefer at least for the next ten or twenty years the control in the form that it exists, because if I understand the situation rightly the present representation of Government on the board of the Imperial Bank does not mean day to day interference, and it will not lead to any such undesirable results as you, Sir, seem to have in mind because the small amount of representation that is there continues to exist. It will only enable Government to keep in absolutely close touch with whatever is passing in the Imperial Bank, and it will enable the Government to see more readily than they might otherwise do how the whole thing was being managed. I may further point out that although the Bank of England is supposed to be absolutely independent, my impression from what I have read on the subject is that they always keep in very close touch with the treasury authorities, and it is that kind of touch that will be provided here; and later on if it is found——

4417. But there are no Government Directors on the Bank of England?—I know that, Sir. England has a financial history of 150 years' experience behind it and a very responsible government where anything that goes wrong is threshed out in Parliament. We have unfortunately in this country to continue to labour under the feeling that the position is different and that our treatment of the subject must remain different.

4418. Threshing out questions of currency policy in Parliament does not, I fear, always lead to enlightenment. May I put my question to you in the form suggested by your last answer. The authorities of an independent Central Bank are free to consult and confer with the Government through the Treasury, to hear their advice and to take it if they choose. Does not that commend itself to you as having some features of an arrangement which at any rate is an ideal one as to the relations between the Central Bank and Government?—Well, Sir, I am not prepared to accept that on behalf of the Chamber.

4419. Now let us turn back to one more question in order to elucidate your proposals. You propose that the assets of the reserve should be in the hands of the Currency Department, that they should not be formally transferred to the Central Bank, that the legal property in them should still be in the Government but that the Central Bank should use them as agents on behalf of the Government. Will that make any difference in practice as to the working of your system, or of the system you recommend, or of any other system that were adopted as the basis of the currency, or is it only a formal distinction?—Well, Sir, my feeling is that under the proposals which would make the Imperial Bank act as agents, the working of the Currency Department will not be very different from the actual working of the note-issue Department of the Bank of England, because in England—if I am wrong, you will correct me—the

Bank has no discretion as far as the note-issue Department is concerned. If notes are tendered, it has to give out gold. If gold is tendered, it has to give out notes. Of course it is called buying or selling, words to which I object. But apart from buying at the rate laid down by statute and selling gold at the rate laid down by statute, I have not been able to see anything in which the discretion of the Bank of England comes in as far as the note-issue part is concerned. As far as the control of credit in the Banking Department is concerned, that is a different matter.

4420. As far as the note-issue is concerned, its functions are strictly limited by statute?—I agree.

4421. The note is not British currency. As far as the British currency is concerned, the discretion of the Bank of England is a very much wider one?—I am afraid I will not be able to agree. This will be highly technical and I am not prepared to go into a discussion on this point to-day.

4422. Just to pick up the question then which we were asking, as I gather it would be your opinion that this reservation of the proprietary rights in the reserves, as it were, would really not make any very great practical difference to the working of the system you recommend. If that be so, why do you emphasize the necessity of reserving the proprietary rights in the reserves to Government and not transferring them to the Bank?—I think I may explain that. If an agent of mine handles my property, he feels all the time responsible for it, and he knows that he cannot do anything else except what I have instructed him to do. If he is handling his own property, he knows that he can do whatever he likes with it. So my feeling is and I believe that was at the bottom of the feeling of my colleagues on the Chamber's Committee that the best thing was to ask the Imperial Bank to act only as agents; then the Imperial Bank would feel their responsibility as agents and would never think of handling the reserves or other assets of the Currency Department in such a way as they thought best.

4423. The practical importance of this provision, I imagine from one aspect, is that it would make it easier for the Government to terminate the agreement with the Bank as to the control of the management of the note-issue. That would be the remedy if anything went wrong?—Exactly, Sir.

4424-5. As regards the two forms of the reserve, that is the paper currency reserve and the gold standard reserve, we follow your proposals; but I should like to know what your opinion would be as regards a proposal which has been put before us for the combination of the two reserves into one, so that in future there should be instead of two reserves a single reserve, held to cover all the purposes of a reserve, that is the internal convertibility of the note and the external protection of the exchange value of the internal unit of currency, whatever it may be?—You will see that, Sir, from paragraph 18 (iv) of the memorandum. Well, Sir, you will find that the recommendation of our Chamber is that part of the gold standard reserve may be transferred to the paper currency reserve to give it a larger backing of gold and gold securities and thus facilitate the establishment of an effective gold standard and that the remainder may be held in the reserve for the support of the gold standard system that is herewith proposed to be introduced. Now the main difficulty that our Committee felt when they were considering this question of the two reserves was that unfortunately in this country we were loaded up very heavily with the silver token currency, and they thought that the best solution would be to make the paper currency a separate entity with a sufficient proportion of gold backing from its own direct liabilities for the note-issue and then whatever surplus remained should be continued as a separate reserve to look after the other liabilities under the silver token coin and which it was very difficult to gauge exactly at the moment.

4426. Now let me call attention to your general scheme. That provided for the transitional period until the silver rupee ceases to be full legal tender and becomes a mere subsidiary coin?—Yes, that was what my Committee had in mind.

4427. Then we are right in looking upon your scheme as a scheme for the transitional period, during which the silver rupee continues much as it is at present, followed by a subsequent period when the reserves are adequate to undertake the liability and to confront the situation of making the rupee limited legal tender and reducing it to the position of the shilling?—Exactly.

4428. Now during that period, are we at one in thinking that the silver rupee has many of the characteristics of the note, the note printed on silver?—That would be correct.

4429. You agree that there is a substantial veracity in that aspect in looking on the rupee during the transitional period as a note printed on silver?—Absolutely true, Sir.

4430. During that period, in view of that substantial similarity between the silver note and the paper note, is there any objection in theory to combining the two reserves which are held against the liabilities implied in these two forms of note outstanding? If they are both notes, both of the same nature, why should there be different reserves against the two sorts of note? That is the question which we put to ourselves in consequence of evidence that has been tendered?—Well, Sir, that particular aspect of the question has not been gone into by my Committee. They thought that at the first stage if we did what has been suggested in this memorandum then at a later stage we should be able to come to more correct conclusions about the handling of the two reserves.

4431. I do not want to press upon you a question which you think the Chamber is not prepared to answer, but if it is possible for you to express any opinion, as a matter of economic science, upon that matter it would be of interest to the Commission?—I am afraid, Sir, that the Chamber has not considered it from that aspect. They thought that the proposals as embodied in this memorandum would be a very satisfactory beginning.

4432. I think perhaps I may fairly put it in this way with regard to the combination of the two reserves. Would you see anything in such a proposal which would militate against the adoption of the recommendations which your Chamber is prepared to make? Is it inconsistent in any way?—I am afraid, Sir, I cannot reply as a Chamber but if you wish to take my personal views, because I have not been able to consult my colleagues on this particular aspect, then most probably when we would have considered this in detail, the task would have been how to put this gold standard Reserve entirely into the Paper Currency Reserve. Something would have had to go out if these additional gold securities came in and then we would have to consider what should go out, whether it should be the Indian securities or the silver notes which are now in the reserve or what.

4433. I quite follow your answer, but it possibly needs a little amplification. I think you have gone through our memorandum* containing some sketch proposals of various forms of currency reserves?—We have.

4434. May I call your attention to a proposal in paragraph 4 of that memorandum containing various structures. The proposal to which I want to draw attention for the moment is that which has been described as an alternative proposal, though it is wrongly printed as "attractive"?—Yes, we have noted it, Sir.

4435. The basis of that alternative proposal is that in combining the two reserves you should estimate the possible liability in respect of the rupee silver notes on the following basis: that you should seek to estimate the maximum contractibility of the silver rupee note issue, taking that into account as a

* See Appendix 2.

liability against reserves and setting it off in re-establishing your combined reserve as so much increased liability and so much reserve brought in. That would diminish what you refer to as the amount which is to go out, because you are adding a fresh liability in respect of the possible contractibility of the silver rupee circulation. Would that not be so? —With the reservation that this has not been considered in detail by my Committee, I was unable to do it because the papers were sent to us under strict confidence and I have been able to consult only Mr. Lalji here. But we have felt two difficulties, Sir. First of all we do not think it is very easy to gauge today at this stage what the liability of the silver notes that are standing out is going to be; and secondly, possibly we do not understand the position correctly; but we do not see how that liability is going to be shown in the currency statements that are week by week published. They do show your 189 crores of notes outstanding and various other reserves. Are we going in future to assume that there are further 200 crores of silver notes in circulation and so the total is 389 and the assets behind is so much? I am afraid that that is the difficulty that we have been unable to get a solution of; and wo thought that we could not offer you any helpful remarks.

4436. The proposal is that you should roughly assess your liability in respect of the silver rupees outstanding. The figure given here is 50 crores, and it is assumed, if I remember right, that there cannot be a greater contraction than 25 per cent. of the rupees which may be in active circulation?—Which 50 crores do you mean, Sir?

4437. It is referred to in paragraph 4 of the memorandum I am referring to. "It has been suggested as an alternative that this liability can roughly be assessed at 50 crores in respect of rupees outstanding and 1 rupee for every 4 rupees to be coined in the future"?—May I point out, Sir, that is an entirely different scheme? We are discussing a gold exchange standard scheme with a rupee to be freely coined in the future. From that side of it our Chamber refuse to consider the question.

4438. In order to simplify our discussion for the moment, let us omit that final reference to "one rupee for every four rupees to be coined in future". That leaves us only with the liability in respect of rupees outstanding at present?—I am afraid, Sir, we cannot agree to this 50 crores or any particular figure at this stage. We do not think we have material enough for it.

4439. I quite follow; you are of opinion that the difficulty of assessing this liability is too great to be dealt with in such a summary way?—At this stage.

4440. Do you mean at this stage of the knowledge of the position or at this stage of the development of currency policy?—At this stage of our knowledge of the position as it will be 10, 15 years hence, after a certain amount of gold has been in circulation, and after we know what is the minimum amount of shillings that India will continue to want.

4441. Now one or two general questions upon your recommendations before I conclude on this heading. As we understand, the system which you recommend during this transition period will be in effect a gold exchange standard?—No, Sir.

4442. In what respect will it differ from the gold exchange standard during the transition period?—Even in the transition period, Sir, every fresh issue of currency will be entirely against gold. That is what I wanted to draw attention to. If you kindly refer to paragraph 13 of our memorandum, you find: "The next point that my Committee would like to emphasise is that no currency shall be issued in future against anything but Gold". We are of opinion that that differentiates the system that we advocate very materially from what is called a gold exchange standard, because a gold exchange standard postulates the creation of token currency for internal purposes and the exchange of gold for it for external purposes, while we do not advocate anything of the sort.

4443. Your system is different from that in so far as this: that you retain the existing token of the internal currency at its present volume?—Exactly.

4444. But all future increases are to be on a gold basis?—May I supplement that, Sir? If we try to compare it with the present system as it obtains in England, the position if these recommendations are accepted will be that from to-morrow there will be a certain amount of gold currency in circulation as in England. By gold currency I mean gold coins or notes which will be exchangeable for gold and a certain amount of shillings. The only difference that I could see, the only practical difference of course, theoretically there may be others, would be that we might in this country be having perhaps too large a number of shillings than is good for us, but that we have got to see by experience. I have not been able to get the figures of the total volume of silver currency now in existence in England and so I cannot say whether the volume of rupees circulating is too much for a population of 350 millions of people. But apart from the fact, which is merely a fact on the statute, that you cannot exchange the shillings for gold, the shilling circulates freely in England and works as 20th part of the pound and buys everything that such 20th part of the pound will buy. That is what is going to happen in India from to-morrow if this scheme is adopted. The rupee will certainly be a certain part of tho gold coin, and it will go on buying all commodities to such an extent as that part of the gold coin would have bought. So my Committee have thought that the future position in India will not be in practice materially different from the position in England.

4445. I am not sure that I quite follow how your transition period will work in one respect, and perhaps you will assist us in that respect. As I understand, while you have this note on silver outstanding during the transition period, any rise in its gold value above the ratio which you adopt, *viz.*, 15, is to be prevented by your provision as to the coining of gold at that ratio?—Rise in what way, Sir?

4446. Any rise in the gold value of the rupee above the ratio of 15?—Will you please explain how that rise could come about? Then I may be able to tell you.

4447. I should be inclined to ask, how does it come about at present, by such forces in the exchange market which tend to produce fluctuations in exchange, with which you are so familiar?—Because there are two sides to that question, I wanted to get the question cleared up. The rupee has varied in value owing to fluctuations of silver also.

4448. I was not referring to that: assuming stability in the silver market?—Then if it is merely the balance of trade that is going to upset the value of the unit in terms of gold, then it will be adjusted in the same way as in England by some gold going in or out of this country and to the extent that that adjustment is needed gold will continue to go in or out and I don't think the breakdown that you postulate will occur.

4449. Is it part of your scheme that, during the transition period, there should be any legal obligation upon the currency authorities to sell gold at a certain ratio, to provide gold for export or any other form of international payment? I do not see it expressly referred to in the memorandum?—No, Sir, it is not. We have not specifically put it because most probably the committee felt that the reserves with which we propose to begin will be ample to provide for that contingency.

4450. That suggests the question how those reserves would be used. By what method do you propose that these reserves should be used for the purpose of maintaining the stability of the exchange?—I think, Sir, the Imperial Bank would

have to pay out to all applicants gold against tender of local currency whenever it found that the balance of trade was against us because then it would be clearly the correct application of the gold standard.

4451. I think that is implied in your recommendations?—Yes, it is implied. I am sorry it is not there, but it is implied.

4452. Accepting the characteristic to which you refer, that future increases of internal currency are to be in the form of gold, or notes against gold, does that differ in any other way from what we are accustomed to think of as the gold exchange standard?—It would differ in this that in the gold exchange standard it is considered right and proper to issue currency against securities of various kinds, sterling securities. Now that is what we do not wish to occur in the future. That is the most material difference.

4453. The essential of an exchange standard is the differentiation between an internal currency, which is not an international currency, convertible into some other form of currency which can be used for international payments?—Quite so.

4454. Except for your provision as to the increase of the use in India of gold currency which is an international form of payment, it would seem at first sight as if, during the transition period, your proposals were really not different in principle from those of the exchange standard thus defined?—Well, Sir, as we have put it, what we want is the gold standard and nothing else. We want all the implications of the gold standard as far as meeting India's foreign liabilities goes.

4455. I understand that is the final stage?—We mean it immediately you start this scheme.

4456. What do you expect to occur on the adoption of your recommendation on behalf of the Chamber? How do you think this will work out as regards the actual entry of gold into circulation in the country? Do you think it will increaso the amount of gold in active circulation for currency purposes?—Well, Sir, the feeling is that if the public in India got the confidence that our standard was a gold standard, the coins in gold that might go out into internal circulation would most probably remain in circulation because nobody would care to put them into a safe place, as they do now, knowing that the currency was gold and that gold would be available if wanted. I may in this connection, Sir, point out one thing that has occurred to me in our experiences of the silver period. In the evidence before the Herschell Committee it was shown that although silver was very largely used, even at that time, for ornaments and social purposes, practically all of it went through the Mint. Since we went over to gold that thing has never had a fair chance becauso Government refused the responsibility to give gold or to coin gold. If wo agree from to-morrow to mint all the gold that is tendered, then, Sir, my opinion is that the importers of gold will again very largely pass it through the Mint and hold it as coin and not as bullion or as ornaments with the result that on any pressure from an adverse balance of trade all that gold coin which is money will come out to buy commodities in the market.

4457. Suppose that takes place, that the gold that comes into the country under this arrangement goes into circulation substantially, then if that be so, if it goes into circulation, it does not stay in the reserve?—That is what will happen after we make gold payments for internal purposes obligatory.

4458. Wait a moment; that is going just a bit ahead. I am thinking of the transition period. You have given me reasons for supposing that, once this arrangement be adopted, the gold will actually go into circulation and remain there circulating. That was the effect of your answer, was it not?—Yes, Sir. The stages will be somewhat different. Very few men who import 100, 500 or 1,000 ounces of gold will go to the Mint to have them coined. The bulk of such imports will be by bankers, and when they bring the gold their first anxiety will be to get it converted into local currency so that they may not lose anything in interest and so that the gold may become immediately payablo in their own cash. So what will happen is that in the first place the gold will go through the Mint and the currency authorities will issue the equivalent local currency to the bankers who have tendered the gold.

4459. That is for notes?—Then the gold will be coined and remain in the hands of the currency authorities, and currency issued against it and the gold will remain in the Reserve until notes or cheques are offered for conversion into metal. So if in the transition period the option has been reserved, as we suggest, in the Chamber, of cashing notes in gold or in silver at the option of the currency authorities, then the currency authorities will have very great control over the disposal of the gold that has come to the Mint. After the transition stage, and when you make it obligatory on the currency authority to give gold to all comers for all purposes, it may happen that the bulk of the gold will come out into circulation immediately; but this we who have thought over the subject do not apprehend if confidence has been restored in the Indian public that we are on a gold standard, because then they will not come for gold excepting when they want it to be used as metal. If it is to be used as currency we feel that they will be satisfied with holding the currency that then exists, notes or even rupees, and would not bother to go and change it first thing into gold and then spend it in the bazaar. It is only for gold that may be required to be stored or gold that may be required to be changed into ornaments that people will convert their holding of currency into gold. We do not apprehend there will be a rush for the conversion of all local currency into gold.

4460. Possibly. Let me now put to you a difficulty which you may have felt. I fear it will necessitate rather a long question in order to explain precisely the difficulty, which may perhaps be described as a dilemma. Let us assume first of all, that the gold that is imported during the transition period on the whole goes into circulation. If it goes into circulation then there is no accumulation of gold reserves. When you come to the moment at which you are going to limit the legal tender of the rupee, you will have, I imagine you will agree, to undertake then as a preliminary to the limitation of the legal tender of the rupee the obligation for a period to convert rupees outstanding into gold. To do that you will need a substantially larger reserve of gold than you have at present, and since your gold is going into circulation you will not accumulate in the reserves the sum required to meet that eventuality. If, on the other hand, your gold does not go into circulation but stays in the reserve, the local currency in the form of notes being used against it for the currency purposes of the country, then undoubtedly you are accumulating during the transition period a bigger reserve of gold. But, on the other hand, you are, are you not, constantly increasing the proportion of your metallic reserve to your note issue, and that might be expected to produce a state of affairs which will create an irresistible temptation to the inflation of the currency of the country. You will have, in fact, such a state of affairs as has arisen in America lately. What would you say as regards your apprehensions of these respective unfavourable aspects of the proposals which you recommend, if I have succeeded in making my point clear to you?—Yes, Sir, I can understand your question but I am afraid I will have to answer it again in parts, if you will kindly tell the shorthand man to repeat the question becauso unless we take the question in parts it will be very difficult for me to give a correct answer.

4461. If it will assist you, now that I have shown the general drift of my question, I will split it up into parts. Assuming then, first of all, that imported gold on the whole goes into circulation?—That I have already pointed out would not be a very correct assumption.

4462. If we may make the assumption in order to test the possibilities, do you agree, or do you not, that when the time comes to limit the legal tender of the rupee you cannot do so unless you have as a preliminary a period during which you have undertaken to convert outstanding silver rupees into gold? —There are two parts to this question; the first is the time when you come to consider the limitation of the legal tender. In the Chamber's representation we have made it very clear (paragraph 12) that as soon as our reserves become sufficiently strong in the matter of gold holdings, the question of some limit in the legal tender of the rupee may be considered. So if at the time the currency authority——

4463. I think we shall be apt to lose our way it we do not get the preliminary question cleared out of the way. The first question is this: (I think we need to know the answer to it in order to compare your ideas with other ideas we have) assuming that you are going to limit the legal tender of the rupee, can we do it?—Without seeing that the reserves are strong?

4464. Quite apart from that?—Then, we do not assume that at all; our Chamber does not assume that at all.

4465. You assume that you cannot do it unless your reserves are strong?—Quite so.

4466. Is the reason why you want to have a strong reserve this, that you think you will have to accept an obligation to give gold against rupees freely before you limit the legal tender?—There again I am afraid that will not be the opinion of the Chamber; so long as the rupee was not demonetised, that is, made valueless except for its silver bullion, we do not think that we shall have to give notice of a given period during which all applicants who hold silver rupees could come and convert them immediately into gold, because the power of the rupee to purchase commodities will remain, and whoever wants gold will be able to get gold either as bullion or as coins which will then be circulating in the bazaar; and I do not think that there would be any necessity to offer a period during which people would be told that they could go and convert their rupees, because we would not be destroying the value of the rupee.

4467. Not destroying the value of it, perhaps; but must it not be said that you are very seriously affecting the value of the rupee when you are limiting its right of legal tender? Supposing I have ten lakhs of rupees in a hoard, must I not consider that the value of that hoard is very much affected when those rupees can no longer be used for large payments and can only be doled out in fifties?—Quite so; but if you are the holder of such a big stock you would have taken your precautions during the transition period, and those rupees during the transition period would have come in to pay for gold bullion in the open market.

4468. Then of course there would be less gold for use as currency or to enter the reserve; the gold would have been absorbed into the hoards?—The open market gold in Bombay or Calcutta would not be the gold that would go into the currency; it would be the surplus balances of our foreign trade that bankers will bring in that will go into the currency.

4469. Do you consider, then, that the adoption of your proposals will lead to an increased import of gold into India beyond the average of the last two or three years?—I think that also is a misapprehension. India cannot possibly import more gold either for currency or for any other purpose than the balance of her trade entitles her to; so if the balance of India's trade remains as big as in the past two or three or five years, India will import as much gold; if the balances are much smaller it will be much less; if the balances are bigger it will be more. I personally think that it is not likely to be more because in the past few years the quantity of imports has been very vitally affected by the position of currency and exchange. If trade is freed from all these manipulations, it might be found, and in the opinion of the Chamber it will be found, that there will be a freer demand by the public for commodities and that that would to that extent reduce the demand for gold.

4470. If and in so far as the imported gold is taken by the present holders of silver hoards in replacement of their silver hoards, then it is not serving any useful purpose in providing a substructure upon which the full gold standard system is to be built, either in the form of gold currency or gold in reserves?—Well, Sir, what will happen in the future is that unless gold comes in and is sent in to the mint or to the currency authorities, there will be no fresh issues of the currency; so that taking the thing at its very worst, viz., that all fresh gold that comes to the mint through bankers immediately goes out cent. per cent.: the position will be that there will be no further note issue, and the backing will remain what it is when we start with to-day: if gold remains that will *pro tanto* improve the percentage backing; so I do not see that the position would be at all weaker; it may be the same; it may be much stronger.

4471. Let me, on the basis of your last answer, finally turn to the other possibility to which we have referred, and ask you this. Supposing that what takes place is that there is a steady increase in the note issue cent. per cent. against gold brought in and tendered for notes, might it not be said that you are thereby, through the steady rise in the percentage of the gold backing of your note currency, producing a situation which would be dangerous in respect of the very strong temptation which it would impose towards an inflation of the currency?—I personally cannot accept the statement that currency issued against gold means inflation; that is, I know, the view held by many economists in Europe, but I think it is a wrong view and I am supported in that view by the fact that notwithstanding all talk of gold inflation England has rejected all other solutions and gone back to this one well-tried old method of issue of currency.

4472. Is it not a question of degree? As long as you retain the provision that the future issue of notes is to be cent. per cent. against gold, then we may say that, owing to the confinement to that proportion, there will be no risk of inflation. But let me suggest to you the effect it would have upon the commercial and industrial community of seeing a rise to a very high figure in the gold and the proportion of the gold backing against the note issue. When the time came when industry as a whole was badly in need of financial accommodation, might there not be an almost intolerable pressure brought to bear upon the currency authorities to attempt to build a higher structure of credit upon this big gold backing?—I am afraid, Sir, if you ask me to give an opinion about assumptions which I am unable to accept, I am not in a position to reply to them. I do not agree that industries will be in a very tight position and will insist on more financial facilities when our gold percentage is very very high. It will be rather the other way, because India will be getting into its currency circulation only as much money as it earns and if I may be permitted to point out any assumption of the kind that you, Sir, put forward in your question is the very negation of the gold standard. It is exactly the giving out of that currency and playing in your and my pockets that makes people think of investing it in profitable channels, and it is not the small individual owner of one or two or five sovereigns who is going to create industries; but the larger circulation of money among the people means better trade and better trade means a much more prosperous position for the trading and industrial classes

and that ultimately leads to new developments in industry, which means that gold again is used in building up or developing industries. So I am unable to accept the statement that the mere existence of that gold will bring about either inflation or very serious monetary stringency. If I have not correctly understood your question, you might kindly put it in a different form.

4473. Not at all, Mr. Madon; I think you have, if I may say so, clearly apprehended my question very well. Finally, I understand that your Chamber expresses on the whole a preference for the sovereign rather than the mohur as the unit of gold currency, that is, subject to arrangements being made for minting?—And a very clear assurance that the Royal Mint given to us will not be withdrawn on very frivolous pretexts. If you will permit me, Sir, it is not merely to complain but to show the difficulties that we fear; in 1918 a Royal Mint was opened here, sovereigns were coined, and it is in evidence before the Babington-Smith Committee that minting was stopped because the gentleman sent out from England fell ill. If that kind of thing is to occur again in the future, then our Chamber says: "let us have a mint of which India is the sole master." Otherwise we would certainly welcome the sovereign which is the most commonly known unit all over the Empire.

4474. I think that is a very clear reply; it precisely shows the opinion of your Chamber. I do not intend to question you again at any length upon the subject of the ratio. Just let me put it in this way. In dealing with the ratio as regards 15 to 1, are there any considerations which the Indian Merchants' Chamber desire to advance supplementary to, or different in character from, those which you so ably expounded to us the day before yesterday?—The Chamber as a body of merchants are convinced that any higher ratio than what we have had ever since we went over to the gold standard is detrimental to the development of India's industries as well as to India's agriculture. In the personal evidence, Sir, I tried to support that by technical reasons so far as I was able to put them forward, but as a Chamber I would content myself with this general statement.

4475. As regards this question of ratio, there is one point in your statement as regards the opinion of the Chamber and of yourself, Mr. Madon, which I should like to be clear about if I can. It has occurred to me that some of the evidence given—not I think by yourself—has suggested this point of view that, if there be any disturbance in passing from the present market ratio of 13⅓ to that of 15, it can in some way be avoided on the acceptance of a full gold standard system by fixing a ratio of 15 to 1 in relation to an Indian gold coin, the mohur, or a sovereign in circulation in India. What is your opinion on that? Again I have to ask you to make an assumption in order to make my question clear. My assumption is that there are some disturbances involved. Supposing we were continuing the present system and passing from a ratio of 13⅓ to 15, is it your opinion that, if there be such disturbances, they can in any way be avoided by the introduction of an Indian gold coin as the standard unit and the fixing of the ratio as 15 to 1 in relation to that unit?—I will repeat the question as I understand it so that I may know whether I am answering the right question.

4476. My difficulty is that I am trying to bring your mind to a point of view which I believe is not your own?—If it is a question that our suggestion of 15 to 1, if adopted, with the sovereign as the standard coin, will lead to disturbances and that, if it is adopted merely for internal relations between some gold coin, sovereign or mohur, and the rupee, there would be no disturbances, then I am afraid I cannot agree. I am afraid, Sir, I have not followed the question. I will put my reply again in a different form. I think, Sir, that there will be some little disturbance when you change the relation of the rupee to the gold coin from what it is to-day, say 13⅓ to 15. That cannot be avoided.

4477. I do not want to stop your answer but, if I may say so, you have satisfied me by your answer so far?—Then, if you will permit me to go on, we shall have to consider the kind and the intensity of the disturbance that is likely to occur. Now, Sir, going back from 18 pence to 16 pence means affecting the interests of all those who at the moment have got to remit money home because they would have to spend more rupees in order to get the same sovereign. Let us examine who these people will be. If it is bankers, their position, unless I am very wrong, will be that of an overbought sterling position, because from the very fact that the export trade of India is something like 120 to 150 crores—say 80 to 100 million pounds, in excess of the import trade, it would be surprising if banks were not holding more bills than their commitments for remittances. If my analysis of the situation is right, then all these bankers who have bought bills to-day on the basis of 13⅓ rupees will get their pounds in London and be able to bring them all back at more money. So I don't see that the banking community will be affected adversely. And the only other community will be the import trade, that is the people who have made contracts for foreign commodities and the shipments have not yet come in, the remittances have not gone. These people could be divided into two classes. There would be the more careful class who would cover its engagements because they could be covered. The talk of disturbances is put forward on the analogy of what happened in 1920-21, but then, Sir, the position had become so difficult that bankers were unable to take any such responsibility as to give forward exchange cover. To-day the position is different. Bankers are willing to give exchange cover to all importers who want it. I understood yesterday from a well-known exchange broker that they are willing to do it right up to December next, twelve months hence. Now, Sir, all those who are familiar with the import trade know that there are very few import contracts which extend for 12 months. They are mostly seasonal, and if the first season in March, April, May, goes through smoothly, and the rainy season begins auspiciously, then about July-August, fresh contracts are made. So, to-day, the knowledge such as I have of the import trade (and I am myself an importer, Sir,) leads me to think that there cannot possibly be import trade contracts which extend very much beyond April-May or June next year. And every one of these gentlemen, if he wants to cover himself and to avoid risk, is to-day able to cover. If there are people still, the other class of importers who are speculating on the exchange going up to 20 pence or 22 pence, or whatever it is, and who hope to make a profit by that, then we need not consider them at all, because they went for a speculative profit and did not cover, and they would be making a speculative loss. So, Sir, if you consider that my analysis of the situation is sound, then I don't see that there would be any important disturbance of trade by going back from 18 to 16 pence.

4478. How would the transfer of the ratio from 13⅓ to 15 affect the holders of gold who purchased that gold at 18 pence?—All those, Sir, that hold gold to-day? The practice in the gold market is never to hold gold for long periods in sterling money. Gold is generally bought for immediate or near shipments and exchange is generally fully covered. So that all holders of gold will be holding gold on a rupee basis excepting perhaps a few whose shipments may be on the way when some new rate is declared. And as I have already pointed out, such holders would be in the same position as the importers. They would have no business not to cover their exchange. If they haven't it is their risk. If they have, then the position would be that the gold which they would be holding would have cost them Rs. 21/4 or thereabouts, and going back to 16 pence would give them

a profit not a loss. If there are any other sections that you have in mind, and if you can put them before me, I shall be pleased to try and explain what I think of them.

4479. (*Chairman.*) No. I think that completes the picture very adequately, for which I am much obliged to you. There may be a few supplementary questions which my colleagues might like to ask, unless your colleague desires to supplement in any way your answers on the questions we have already dealt with? (*Mr. Lalji Naranji.*) No, Sir, I have nothing to add. Mr. Madon has dealt very fully with the matter.

4480. (*Sir Henry Strakosch.*) I have one question to ask supplementary to some of the questions put to you by the Chairman. You told us that the prospect of introducing a gold standard would create a great deal of confidence in the country which would lead to the investment of the savings of the country in things other than precious metals, and that is the end which you have in view?—Some of them.

4481. You also said that it is common knowledge that India, as a rule, has a heavy balance in its favour abroad, exporting more than it imports. And I believe your scheme is based upon the supposition that the surplus available abroad will be brought into the country in the form of gold, which gold would then be gradually accumulated and put into circulation at a date when you have sufficient gold in hand. Now I want to put to you a possibility which does not seem to me very remote. If confidence is established, it may well be that the people of India will invest their surplus accumulated abroad, not in gold but in a form commonly used in other parts of the world, namely, capital goods—goods brought in for the development of the country. If I may explain: What usually happens in other countries is that a surplus abroad is converted into ploughs, into reaping machinery, in fact into things which are there to improve the system of production and cheapen it. Now, let us suppose that this process does develop in India. Then the consequence would be that no gold or a very small amount of gold would be remitted to India in settlement of its excess of exports. You have told us that, under your system, in the intermediate stage, the only possibility of creating currency would be against the import of gold. How in those circumstances would the currency be increased to meet the real demands of the country of greater trade, if as I suggested the surplus available is brought back into India not in the form of gold but in the form of goods for the development of the country?—Again, Sir, I have the same difficulty as I expressed to the Chairman, that it is a very long question. If you will kindly allow me to divide it—because each part of the question will again require an answer from me.

4482. I have put to you an assumption, and briefly put, it is this, that confidence having been created, the most desirable development takes place, namely, that India draws its surplus available abroad not in the form of precious metals but in other goods which are helpful to the development of its resources?—Up to that point, may I try to answer? If India draws its surplus—by the word "surplus" I mean after payment of all its liabilities, for not only goods but services, and also for such gold and silver bullion as the social customs of the people render necessary, because they will go on buying that as a commodity, it won't be cash—then, Sir, if there is still any surplus, it will, if India is developed, undoubtedly be laid out in capital goods as you say. I agree, Sir, but it rarely occurs in any country of which I have knowledge that the total exports in the wider sense are 100 and the total imports in the wider sense are 100; so what will happen, Sir, in the case that you postulate, namely that on the visible balance of trade India has exported 100, and India has imported 100 of goods, services and treasure, and there is not a cent left from which you can add to the circulation and to the currency—I do not see that difficulty, Sir, because that difficulty has never arisen in any country that I know of, in any gold-standard country. What will happen, Sir, is this. If currency is needed, and will come in, it will mean that loanable capital in this country will have more value; it will have a better value than say in England or America or other gold-standard countries, and bankers will see to it that money comes in not as settlement of the balance of trade only, but if there is no such money, and if they still see that money could be profitably used, that money will come as short-term capital. Bankers will borrow in the cheaper gold-standard markets, and, say, England will lend to India, so I cannot anticipate the condition of things that you fear, Sir, in which India will have bought cent. per cent., and there would be no surplus left from which currency could be created and which would lead to congestion; there would be no congestion *if* we are on a gold standard.

4483. I am speaking of the period of transition preparatory to a gold standard. I have started from what I understood your idea to be, namely, that the stock necessary to introduce the gold standard will flow into the country by natural processes. That is my supposition. May I just put another point to you. You said that other countries usually balanced their trade. This is to say, their visible trade is usually balanced, and no great amount of gold or precious metals move backwards and forwards?—I do not agree if you put that as a postulate.

4484. But you have just said?—That is not the condition for instance in America to-day, nor in Holland, nor in Sweden, nor in Switzerland; so if that is to be a postulate, then I cannot agree.

4485. Then I do not quite follow your point. I had understood you to say that you saw no difficulty for the country if a hundred per cent. of exports were balanced by a hundred per cent. of imports of goods, apart from gold. You then said——?—Not apart from gold; apart from gold which would come in as currency, not gold which would come in for social purposes; I include that.

4486. Yes, but we have dismissed that idea, that gold for social purposes will come into the country to any great extent, because I have accepted your view that if you promise the introduction of a full-fledged gold standard with gold in currency, confidence would be raised to such an extent that people will no longer invest their savings in metals?—No, Sir, I have not understood it that way. You have misunderstood me. Gold that is required for ornamental or social purposes will continue to come whatever happens.

4487. But that gold will not be available for currency purposes?—I agree.

4488. I am trying to see how the country will get stocked with gold, because if in another country trade balances without the introduction of precious metals, it is because those countries are stocked with their monetary needs?—I do not agree with that statement.

4489. But we are contemplating to stock this country with a sufficient amount of gold to be able to take up gold payments internally and externally?—First of all I interrupted you, Sir, by saying that I do not accept the statement that gold does not come into any country for payments because a particular country is sufficiently stocked with gold. Our experience of America absolutely contradicts that. America has now an enormous stock of gold, but gold still goes there every year, every month. So, pardon me for having interrupted you, I could not accept such a statement without very serious qualifications. Then, Sir, you next say that your chief difficulty is that assuming gold comes in as currency, where are we going to have a stock of gold to convert? Convert what, Sir? If to-day we have 200 crores of notes and we start with a backing of say 40 or 50 crores, if no gold comes in as currency, there will be no further notes issued and no further backing would be required. If gold comes in, if it is exchanged for currency cent. per cent., then every million of gold will increase the percentage. If it

does not come in, there is nothing more to be done because you do not want any gold, the liabilities not having been increased.

4490. But your circulation does not consist merely of notes? It consists of the note printed on silver and you have told us earlier in your evidence that it would be hazardous to say to what extent those notes printed on silver are in circulation, and some of those notes printed on silver may come back and gold may be demanded. Therefore we have to consider how the country is to be stocked with gold. You suggested as a probable development of things that if no gold were introduced and if all the exported goods were paid for by the import of goods, then the tendency would develop for loans to flow into the country and that these loans would be helpful. Well, there are two things. One is this, that those loans obviously cannot be of any use to build up the stock of gold which we need in order to stock the country with gold circulating media?—Why not, Sir.

4491. Because the loans might be withdrawn, and the minute they are withdrawn they are no longer available. There is a second point. You have told us that you would not issue any currency except on the basis of gold. I do not quite see how these loans will increase your currency, my point being that, unless you increase the volume of your currency with increasing trade, some disturbances must follow?—Disturbances of what, Sir?

4492. The disturbances that usually follow either from an insufficient volume of currency or a redundancy of currency?—May I now reply? Your question, Sir, has two or three big assumptions. The first big assumption is that year by year over a series of years India's trade is to be cent. per cent. balanced. I regret I cannot accept that because that is not our past experience and not the experience of any country that I know of, Sir. If you will kindly enlighten me, I shall be very happy. The second very big assumption is that money which will flow in as loans will go back shortly so that that gold will not be available for currency purposes. I beg to differ there again, Sir. When a bank brings in a hundred thousand pounds because it sees its way to lend to a client fifteen lakhs of rupees, the first thing that the Bank will have to do is to put that gold through the mint or through the Currency Department in order to get local currency. So the gold—I hope you agree, Sir,—has in any case first to go through the Currency Department. Then we come to your third assumption, that when the loans have got to be repaid, the gold will be all withdrawn. There also, Sir, I am unable to accept your position. It may be that the repayment may be in the following year not in the shape of currency gold being withdrawn, but if in the following year it balances cent. per cent. as you assume, the cent. per cent. would include the liability for the repayment of that loan through exports so that the gold which came in would remain in the Currency Department. It would not disappear. Then regarding the last assumption that in no case taking everything that you say, cent. per cent. of imports and exports, no gold would come in and all loanable gold would be withdrawn, you assume, Sir, that in the face of all that we shall declare that we are going to give gold for rupees, that is, take the liability for the conversion of the internal currency, which is another assumption, and I believe in reply to the Chairman also I tried to make it very clear that we cannot accept that. We as practical business men have come to the conclusion that we cannot undertake liability to convert the rupee stocks into gold until after a space of years we have resurveyed the situation and found that we are sufficiently strong to do so, so that, Sir, I cannot agree either to the assumptions or to the conclusions that you draw from it.

4493. Well, Mr. Madon, if one has to take so important a decision, one has obviously got to take into account possibilities which in the view of some of us at any rate may not be so very remote. I think you have cleared my mind completely by saying that your whole proposition is based upon a policy of not introducing a full fledged gold standard until you have stocked your country. Therefore even if that process which you suggest were to take 20 years, no misfortune would happen because all you would say is this, that the country is not fit to introduce a gold currency because it so happens that we have an insufficient supply of gold currency?—I would not say that the country is not fit. If I were to put it I would say that the country had the misfortune to have had such a management that we are loaded with 300 crores of token metal coins. If you want me to put it that way, I am obliged to put it. I think India is the one country that is most fit for the gold standard.

4494. But you see circumstances may be very unfortunate; but there we are. We have three hundred crores of rupees in circulation and we have got to get over the difficulty. There is only one slight point to make clear and it is this. Of course in all these things when there is a country borrowing, whether it is for public services or for private enterprises, one must surely in one's calculation contemplate that the money lent to the country may be withdrawn and one obviously must make preparations, and therefore any gold coming into the country through contracting loans abroad must, at any rate in the minds of these people, be earmarked as a possible drain in the future. Do you admit that?—May I say that this is another very big assumption? The people who would borrow would not be earmarking the gold that came in as the gold that would be repaid. They would be earmarking their future services and goods for return which will not be gold.

4495. But in a gold standard country one has got to do it?—It is a very big assumption for India.

4496. Would you suggest, therefore, that if the country borrowed heavily, it would to the extent to which the loans are repayable so adjust its production as to be able to have a surplus available to meet that debt?—May I point out, Sir, I had begun by pointing out that such a cent. per cent. adjustment of trade was what I could not expect. But even after that assumption, when I talked of a banker bringing in 100,000 pounds because he had a client, it may be that the client was going to lay out that 100,000 for productive purposes.

4497. That is if the amount were lent on long term?—It may or may not be on long term. As far as the banker is concerned, it may be on short term. But in the next or third year the balance of trade of India may have sufficient surplus to pay off that loan and the adjustment would not be apparent; but it would be the position that some part of India's export trade in the next or third year would have found that money which will not be gold.

4498. There is only one other point. We know that gold is being dealt in in India very freely. A large section of the community makes it its business to deal in gold bullion, and the chief market is Bombay?—You mean by dealing, buying and selling?.

4499. Yes?—Then I would not say a large section.

4500. You would say that the bullion market is a very important market in India?—Only in value, not in size. Last year they dealt in 60 crores. In the value I agree.

4501. Now are those dealers in the habit of retaining a stock of gold?—Might be, like every other dealer.

4502. Like every other dealer. Now we know there are records available as to the holding of silver in this country and also in some of the bigger places in China. Is there any record available as to what stocks of gold are held in Bombay or in India generally?—You mean held speculatively or as stores of value?

4503. The figures are given by Montague?—I do not know where he gets his figures from.

4504. Every week there is a statement of the amount of silver held in India and the amount of silver held in Hongkong, &c.?—That is merely in the Currency Department. He cannot give and does not

give any figures of the amount of silver in the country.

4505. He does give something else?—He gives the number of bars that are available in the open market in Bombay and Calcutta, because that every dealer knows, every banker here knows. But that is not the same thing as the total number of bars that may be held all over India.

4506. I follow that?—You have not got here that figure anywhere in India, and I do not think it is possible. In India, particularly in up country areas, these are a very convenient form in which wealth may be held in store until wanted. So you might find that in every second or third household in certain trading localities, they might be keeping a bar or two, merely keeping, just as you would keep your notes or money in the bank.

4507. I do not want to trouble you with that. I only want to know whether there are statistical data as we have them in other countries of the stock of a commodity held by dealers. You can ascertain any day what the stock of lead, what the stock of tin, what the stock of zinc is?—Even lead and zinc, you can find what is held in London. If you speak of tin, how much is held in Europe,how much in every factory, nobody knows.

4508. All I want to know is whether any such figures are available in India?—Not for gold and silver, except what is held in the central markets.

4509. (*Sir Maneckji Dadabhoy.*) It is your opinion, the Chamber's opinion, I understand, that every time a ratio is altered, it more or less causes a certain amount of economic disturbance?—Yes.

4510. But the intensity of that disturbance is a factor to be taken into consideration, and if we come to the conclusion to go in for a lower rate, you do not think the conditions, the conditions during the last 16 months, have been very intense as to cause a great economic disturbance in the country?—I have tried to make it very clear in my reply to the Chairman that I do not think that the disturbance will be at all important.

4511. Do you think Government would have been in a position to maintain this 18d. ratio had it not been for the preceding four good harvests?—There you ask an opinion. Commercial opinion in Bombay is that it was mainly the successive good harvests that enabled the Government to continually bolster exchange up. But it is not only in Bombay, Sir, if I may be permitted to quote the opinions of Calcutta commercial magnates, one of these gentlemen, Sir Campbell Rhodes, who was a representative of the European Commercial Community in Bengal, expressly stated during a debate in the Council that he felt very doubtful whether 1s. 6d. rate could be maintained were it not for the fact that we had three good seasons. That was I believe early this year or end of last year.

4512. You agree with that?—I think that is correct in any case, Sir.

4513. To put it in a different way, it would be far easier and simpler to maintain our rupee at 15 to 1 ratio than it would be at 13⅓ to 1 basis and the reserves that we now have got would be much ampler for the purpose if the rupee revalued at 15 than at 13⅓?—That is the only thing that I can say.

4514. You know now that the Government of India have lately adopted a policy of protection in the matter of protecting Indian industries. This higher level of exchange has the effect of neutralising that protection which the Government gives to industries. I will give you a concrete instance. I give you the Tatas' case. The Government have given them a certain amount of protection. That protection has been rendered practically of not much good, because the Belgian market on account of the 1s. 6d. rate of exchange is able to dump steel and iron in this country?—That would lead us into a very big question; but for the benefit of the Commission, I am only drawing attention to one fact. Last May, June, July, the Tariff Board was set to work to decide what bounty should be continued to the Tatas. There are two kinds of help as you all, Gentlemen, no doubt know, one a tariff duty and the second a bounty. The Tariff Board investigated and came to the conclusion that it should be Rs. 18. The Government thought that they were pampering the Tatas altogether too much, and they gave Rs. 12. I beg to draw the attention of this Commission that the price of steel is Rs. 150 to 160 per ton. If this country goes back to 1s. 4d. rate, the 12½ per cent. difference on 150-160 would mean Rs. 20 a ton. If Government only go back to the normal ratio, I am sure Tatas would thank them heartily and hand them back their bounty.

4515. That is neutralising the effect of that?—Not only neutralising, but it goes much further. That is the unfortunate part of it.

4516. So far then as the internal industries are concerned, for the advancement of internal industries, I understand that a lower rate of exchange is necessary?—I would not use the word "lower." If you will pardon me, it is not a question of a lower rate or a higher rate. It is a question of the rate on which the capitalisation of the industry had been based. For instance, Sir, if a cotton mill has cost 150 lakhs of rupees, when it was built in 1913-14 or something like that, it would have meant a million pounds. It could, it must have laid out its programme of being able to compete with a similar cotton mill elsewhere that had been capitalised at the same cost. By this change that original capitalisation of 150 lakhs of rupees becomes something like a million and two hundred thousand pounds, and thus you appear immediately over-capitalised without having done anything whatever as against your competitor in the foreign country. I say if the ratio adopted had been 20d. in 1878 or 24d. in 1872, it would not have mattered; that ratio would have done no harm. The harm comes in from adopting a particular unit and then varying it.

4517. Now how is this deficit in the Government budget to be met? If we revert back to 1s. 4d. it will cause a large deficit in the Government revenues. How would you propose to meet that, by taxation?—I do not agree that there will be any important deficit. That argument also is merely a repetition of the argument put forward 20 years ago before the Fowler and the Herchell Committees; but it does not help to-day. 25 or 30 years ago land revenue which could be modified only once in 25 or 30 years was a very large source of revenue. To-day it is a very small part of the total revenues of the country. Customs are a very big item, a great deal bigger than land revenue. Income-tax is a very big item. Railway revenue is a very big item; and so on. What we feel is that there would be no loss to the finances of the Government if we reverted to the ratio that prevailed for so many years, because first of all the customs revenue would automatically expand for the greater part of it by 12½ per cent. The duties are all *ad valorem*, so any goods that are worth say a hundred pounds and come in to-day at 1,300 rupees and at 12½ per cent. paid to Government, say Rs. 156 would come in at Rs. 1,500 and pay to Government Rs. 180. I simply give that as one instance of how the thing would operate, so that I think if the position is carefully considered under each head of revenue it will be found that the fear that there will be a loss to revenues is unfounded, excepting perhaps that there might be a slight discrepancy but it is not on account of such discrepancies that you should perpetuate a wrong because discrepancies do occur in the Budget, you estimate for so much in revenue under one head, and you find it 50 or 100 or 200 lakhs less or more. I would then put my answer in two parts, the automatic change in the amount of revenue because of the higher values at the 1s. 4d. rate and I claim that that would make up practically the whole of the loss of revenue because income-tax also will be similarly affected. As for other items that is a much wider question, but if there is any deficit, which I am hopeful will not occur, that will be covered up by the normal expansions of revenue.

4518. Is it a fact that the gold value of commodities has not induced the European countries to change their ratio from time to time?—I know of none excepting the insolvent countries who could not help themselves.

4519. (*Chairman.*) Mr. Madon, we are putting a very heavy strain on your time. What I was going to suggest was that possibly Mr. Naranji could relieve you in reply to any of the questions?—The questions go into details and Mr. Lalji told me to tackle them and he would point out to me wherever he thought that we should modify them.

4520. (*Mr. Preston.*) The questions I am going to ask you are simple ones and only connected with the actual practice of gold shipments. The first question I ask is—I understand in your system these gold shipments will not be required until Council Bills have been exhausted—shipments from London to India?—They cannot because that is part of the goods and services that India buys.

4521. The next question I shall ask you perhaps personality will come in but I want to do it because I think on your side it will make your answer clearer to Sir Henry and also possibly explain to him some matters that go on in the Bombay market to-day. It is very opportune at this time as one sees from the railway the cotton being collected and coming down to Bombay. Supposing a Bank in Bombay were to wire to London office and say I want 50 lakhs of rupees to advance for cotton in the cotton districts and the cotton comes down to Bombay to be shipped to Japan extended over a period February—March—April. Now under your system council bills being no longer available they have got to ship gold?—Agreed.

4522. Assuming they ship one million gold to lay down at 1s. 6$\frac{3}{16}$d. and Japan bills come into the Bombay office in January—February—March as the cotton goes out from here to Japan, the agent here will buy Yen bills at a rate. Those Yen bills when they mature in Japan will be converted into sterling and if the Yen funds ultimately result in getting 16$\frac{1}{4}$ again six months hence in London, all we have got to consider is how much interest we are going to earn for a million of gold which was shipped to Bombay in the first instance. Is that correct?—Yes.

4523. Just one more question. Advocates of the gold currency advocate from time to time that we should bring to India all the gold in the gold standard reserve and also in the paper currency reserve, and they have stated as a reason for that that our good friends in India like to see gold on the spot, do they think that it would be a great inducement to the people to take notes. That has been advocated, has it not?—Well, Sir, the reply would mainly be a question of psychology not of currency science. What has happened in the past is that India's gold, even when it came out direct to India from Australia or Africa, was diverted to London and kept there for a time, then converted into sterling and then even the gold that we held at the beginning of the war disappeared and we got paper on which ultimately we made very immense losses. If after all these experiences the Indian public wishes that it should have possession of its own gold you will pardon it for doing so. If the world changes so much that we can trust our neighbours then possibly that fear may disappear but even if I trust my neighbour absolutely, if it comes to a question of life and death I really don't know what he will do or I will do. The war created that question for England and the Allies; the gold was there, they had to take it and they took it without so much as "If you please." If after all that experience Indians say they cannot allow their gold to go elsewhere but must insist on its being in India, I hope you will not think that they are making any unreasonable demand, Sir. Then there is a side reply, Sir, which you will permit me to put forward. The gold that goes to England is not England's gold. You will pardon me for saying so; I am making a rather emphatic statement; but if you will reflect for a moment India's total exports are 360 crores and her total imports are 220 crores; the remaining 140 crores is cash that India has a claim to from different countries of the world. By cash when we are talking of international payments we mean gold. So it is India's gold that should have come to India that goes to England. So even if it was a question merely of what should be done, then you should not take it that the gold is England's; and if India is anxious to take it away it should not be prevented. You have got to see that the gold is India's first. If India did not belong to the British Empire, England would not get an ounce of gold. We give England control of 30 to 40 million pounds in gold through India's balances, and if that is the case then is it not reasonable that after having given England control of so much gold for their council bills and other services, if we have something left we should bring it back to India?

4524. I appreciate your reply. Now what I want to ask you is this. To move such a large amount of gold would create a world disturbance, would you approve of it?—Large amount from where, Sir?

4525. From London to India?—In exchange for what?

4526. For the mere pleasure of bringing it from London to India?—Is your question that we propose to convert our gold exchange standard and paper currency reserve into gold?

4527. To bring out the gold for the mere pleasure of bringing it out, attended as it would be with such disastrous results, would that meet with your approval?—The Chamber has not said that anywhere. What we said was that the Government should accept it as a policy that in future gold should not be diverted from India to other countries, not even to London. Whatever is there already may remain there until the Government sees its way to conveniently either bring it out or use it up. The Secretary points out to me that in paragraph 18 (iv), we say that the location of the reserves should be in India at least as regards the gold part of it, which implies that we accept that the sterling part of it which is there will remain there for the present.

4528. Let me just go on. Then I assume naturally that under your scheme the idea is gradually to attract gold, as it is possible to get it, to India for the ultimate purpose of a gold standard and a gold currency?—The only reply I can make, Sir, is that my Chamber as commercial men do not wish for any undue disturbance of the state of affairs provided the principle and policy are accepted.

4529. Then what I want to ask is this, the interest on the securities in the gold standard reserve in London and the interest on the securities in the paper currency reserve in London amount to 2$\frac{1}{2}$ million sterling total each year. That money to-day goes into the revenues of India. In the old days the interest on the securities in the gold standard reserve was added to the said standard reserve?—No, only the interest on the securities in the gold standard reserve. There are two parts in your question. In the paper currency reserve there were sterling securities also even in pre-war days and my impression is that the interest earned on the paper currency reserve was always taken to revenues but the interest earned on the gold standard reserve was allowed to accumulate.

4530. It was added to the capital fund of the gold standard reserve. Then what I want to ask is, as 2$\frac{1}{2}$ millions annually is collected, if that should be converted into actual sovereigns shipped out to this country and retained here for the purpose of the gold standard, in ten years' time you would get a fund of 25 million pounds, in 20 years' time you will get a fund of 50 million pounds; and there would be no disturbance to world's markets. Would you agree to that?—I would agree, Sir.

4531. (*Sir Alexander Murray.*) May I ask Mr. Madon some questions in his private capacity and not as representing the Indian Merchants' Chamber and Bureau?

4532. (*Mr. Madon.*) If it is in my personal capacity you will kindly allow it to be done when I am again before the Commission, Sir, because I do not wish to complicate my answers as representative of my Chamber with my answers in my private capacity.

4533. (*Chairman.*) Perhaps your questions might be put to him in his personal capacity later. It might be rather difficult for him to answer such questions now, when he is appearing in his capacity as a representative of the Chamber.

4534. (*Sir Purshotamdas Thakurdas.*) If you do not mind, Mr. Madon, I propose to ask a few questions of Mr. Lalji Naranji, because I think the Commission would like to have the benefit of his experience as a man of standing in the commercial world in Bombay.—I have no objection.

4535. Mr. Lalji Naranji, you are one of the senior partners of Messrs. Muljee Jaitha & Co.?—Yes.

4536. How long has that firm been in existence?—Nearly a hundred years.

4537. You have branches all over India for cotton and seeds and all sorts of raw produce?—Yes.

4538. You also have your own ginning factories and are in touch with the rural districts of India?—Yes.

4539. May I ask if you are intimately connected with some important Indian States and that at times you act as their agent here in their financial transactions?—Yes.

4540. You are also a representative of the Indian Merchants' Chamber on the Bombay Legislative Council?—Yes.

4541. Could you tell us in the light of your experience, from the various points of view which your position brings to you, what the people of India would think if a gold exchange standard were introduced in the following manner: there would be gold in the treasury, but the gold would not be available for internal currency purposes while available for export where necessary: gold notes would be circulating among the people as inconvertible notes and the notes would have a backing of gold; and there would be gold in the treasury. Could you tell us what would be the effect on the public of India of an exchange standard of this nature?—I understand your question is that if the notes are tendered they will not be convertible into gold; and so long as they are not convertible into gold they will not command the confidence of the public as Mr. Madon has just now said. All that the Indian population, the commercial as well as the rural population, wants is that they should be convertible into gold; notes or coin or whatever it may be, it should be convertible into gold; otherwise it will not create confidence which a currency ought to command.

4542. Unless gold notes are convertible into the precious metal in the same manner as the rupee notes to-day are, you apprehend that those notes will give a set-back to the popularity of currency notes even as at present existing?—Yes.

4543. Could you tell us why it should be so?—Because at present their experience has been that the rupee, though worth ten annas, is really valued at seven annas, and they have no faith in the present rupee currency, and that is the reason why they are now dealing more in gold. Even the import of gold has something to do with this, because they have no confidence in the present silver rupee; they calculate it, as I have already said, at seven annas; they wish that there should be a gold currency. If there is a gold currency, any time they wish to convert their notes into gold they could do so and there will be more confidence.

4544. When gold currency of this nature is put into circulation, what do you think would be the effect on the people? Would it lead to more hoarding or would it help the hoarded metal to come out, or would it discourage the hoarding of precious metals?—The word hoarding is a misnomer. As regards this hoarding I would refer you to the speech of the late Sir Vithaldas Thackersey so far back as 1912 or 1911. There is no hoarding in Bombay in the proper sense of the word.

4545. We will talk of all India, if you do not mind?—You said that it would affect the hoarding of gold; what I want to explain is that the word hoarding has been a misnomer; there is no hoarding in the practical sense in India; I say it because you as one of the leaders of the Hindu community will bear me out, that out of the 350 millions of the population nearly 240 millions are Hindus and the practice of Hindus is that at the time of their marriage the people keep certain ornaments for their use; it is not hoarding, I would call it a necessity; and ornaments even are not given as a hoard, but as a sort of property to the woman; the Hindu women have no right under the Hindu law for inheriting any property and all that they are given for their maintenance is these ornaments that are given to them. So you will see that there has been no hoarding in the proper sense of the word. Another thing is that if a gold currency is introduced as it is wanted by the country, I am sure that the dealing in bullion will not be so much as it is now because there will be the backing of gold and the notes will be convertible any time. On this question I would remind you of one instance; if you remember during the war there was a time when rupees were not available. Then the silver coins went to $12\frac{1}{2}$ to 20 per cent. premium and they were offered. As soon as they became more freely available, notes began to be used so much that in the cotton districts with which I am connected there has been a great change and they are accepting notes because they know that these notes are convertible into rupees any time; so in the same way if the notes were convertible into gold, less bullion will be imported into the interior than now.

4546. Would you mind naming the cotton districts with which you are connected?—Khandesh, Berar, Barsi, Miraj, Guzarat and Kathiawar.

4547. You say in paragraph 17 of the memorandum: "My Committee would also urge the greater development of banking facilities all over India as they feel not only that the present facilities are still inadequate but also that such development will very much facilitate the smoother working of the Currency system in India." What is it that you had in mind, and who do you think are the persons who should give the lead in regard to this greater development of banking facilities?—Properly speaking there are no banking facilities, except for the last five years, when the Imperial Bank has opened about a hundred branches. There are so many villages from which we have to buy cotton (I am interested in cotton only), but currency is not available because there are not any banking facilities. The small shroffs who were doing this cash business before are all absolutely wiped off because of the activities of the banks and because of the new rules with which they are not conversant. Banking was done fifty years ago by small people who are not now found even in villages. The difficulty is that you have got to take cash or notes from the big towns, and you have to collect and pay money for the produce that you get from these districts where there are no banking facilities. Neither hundis nor cheques are available; you have to take cash in the form of notes; and if they are not accepted you have to take rupees in coins. The underlying idea in this is that we want more banking facilities, that is, more branches or more encouragement of funds and more easy money so that the small people who have now left off banking may commence it again. Of course it may not be paying to the Imperial Bank to have branches in small villages or to the other banks to do so; the other Indian banks also can, if they attempt, give facilities, but I think with their resources what they are doing is quite enough. Banking has not been developed as much as it ought to have been done, compared with other countries. Of course there are seven hundred thousand villages in India and if you

look at it you will see that there is not a single branch in a village; there are one or two exceptional instances where the Alliance Bank had branches which have been taken over by the Imperial Bank; but even in towns you do not find facilities because the charges are heavy. The charges of the Imperial Bank for transfers are so heavy that sometimes people offer to take risks to even carry their own coins and their own notes. Therefore we say that if more facilities are given in such places where the produce can be had it will supply a great need.

4548. Would it be a correct inference from what you have said to say that in the opinion of the Chamber's Committee the whole process of provision of banking facilities for the country is in a state of transition? It is a question of going over from the original Indian methods of banking to the Western and the progress must necessarily be slow?—Yes, certainly.

4549. One question I would like to ask Mr. Madon in connection with a reply which he gave to Mr. Preston in connection with the interest on the two reserve funds. Mr. Preston's last question was whether you would like that interest to be accumulated and to be sent to India in the form of gold every year. If I understood your reply correctly, you said that you agreed with him. You are aware that these two items are at present being credited to the revenue accounts in the budget?—(*Mr. Madon.*) Yes.

4550. Do you think that a hole in the revenue income of the Finance Member's budget could be so lightly made without disturbing the budget?—I do not think I understood Mr. Preston to say that this should be done immediately in the first or second year. Further, I understood the drift of his question was that if it was a matter of two or three million pounds a year of gold that we wanted to ship out from England, then there would be no disturbance to the London Money Market or to other markets, and if I understood Mr. Preston aright the source from which these $2\frac{1}{2}$ million pounds would come was not material. The question put to me earlier, by, I believe Mr. Preston also, was whether the Indian Chamber wanted the sterling securities to be immediately converted into gold and to be all brought out; I said "No," and then the question followed. So it might be that the interest might remain; but the underlying idea, that out of the securities we might realise two or three millions a year and bring that out and that would not create a disturbance, could be carried out. I believe that was Mr. Preston's suggestion, that a small amount of gold should be taken away out of England without creating a disturbance; whether the gold came from the interest or from the principal sum would not matter to you, Sir?

4551. (*Mr. Preston.*) Of course from the inception of the gold standard reserve until four years ago the interest was always credited to the capital fund. Of the 40 million pounds in the gold standard reserve fund to-day, one-third is represented by accrued interest so that in taking out the accrued interest one was not robbing the fund of its original intention, if I may so call it?—Yes; but if I understood Sir Purshotamdas Thakurdas aright, we would be robbing the Finance Department of a particular source of revenue to-day; whether that source was there before or whether it was a legitimate source is a different question.

4552. (*Sir Purshotamdas Thakurdas.*) I only wanted to remind you of your answer that a gold standard reserve costs nothing; if it necessitated what Mr. Preston just now said, namely, to take off from the revenues such a large amount as this, you would call it an immediate cost to the taxpayer?—Well, Sir, that would compel me to go back into some history.

4553. I would leave it at that at present. I hope you will be able to clear it up later?—If you please, you might reserve it for my personal evidence, because there is a history behind it.

4554. Just one more question. It is in connection with the Chairman's question to you regarding the difference between the control on the central bank as people wanted it in the West and the control on the central bank as the Chamber's committee here want. You want more Government control, and the Chairman pointed out to you that in the West they wanted to get away from Government control and wanted popular control, or at any rate control by non-government persons?—Will you permit me to point out one thing here? I may have misunderstood the Chairman's question, but I don't think that is the way to put it. What he said was that, although it was considered a desirable thing for central banks to be divested entirely of Government control, that thing existed only in England and on the continent government control was the practice.

4555. (*Chairman.*) I have not myself, I am afraid, adequate information to venture an opinion to that effect, Mr. Madon. It would require more knowledge than I possess perhaps of all the European systems. I should not care to generalise on quite so large a scale?—Yes, Sir, you would not care to generalise. In any case what I tried to point out in my reply was that such Government control as there is to-day in the shape of representatives on the central board of the Imperial Bank would not be excessive and that the United States considered even a far greater control necessary and that we in this country in the first stages might continue to have some such control through officers who would be in very close touch with the working of the bank.

4556. (*Sir Purshotamdas Thakurdas.*) Do I understand that the committee of the Chamber feel that in asking for Government control they are only asking for control by a body which is responsible to and perhaps at times responsive to the Assembly?—Well, Sir, this has not been put in so many words either in committee discussions or elsewhere, but that was the feeling that if Government representatives were there and if the Assembly did want to get information on any point, they could not be turned down by saying: "Gentlemen, this is a private bank; we have nothing to do with it; we don't know anything about it; if you want information please go to it." The Assembly can always say: "Here are our own officers on the board. They are there to represent our interests. It is their duty to tell us how things are going, and it our right to know." I believe that is the idea at the back of the minds of those who are wishing that this kind of representation should continue.

4557. (*Sir Reginald Mant.*) Mr. Madon, just one question. You spoke of having Government representatives on the board of the bank?—Yes, Sir.

4558. Have you considered how that arrangement could be provided? At present, the Government has experts in the Currency Department who are in close touch with the bank. But I understand that under your scheme the Currency Department would be taken over by the bank. The Currency officers would be officers of the bank?—Yes, Sir.

4559. Where will the representatives of Government come from? How would Government be kept in touch with the bank?—The point is not very material, Sir, if you will pardon me, from my point of view. The officer of the Currency Department is on the central board merely because he is one of the most important officers of the Finance Department to-day. If the Currency Department becomes a department of the Imperial Bank, then the gentleman representing the Finance Department of the Government of India on that Board would be some other gentleman in the Finance Department, or it may be somebody from some other Department that the Government of India think right to put there.

4560. But do you mean that an officer of the Government of India would be permanently stationed at Calcutta or Bombay for that purpose?—It is not necessary, Sir. The Central Boards don't meet every day.

4561. Or (if I might finish) do you mean that an officer would be sent down from Simla or Delhi, as the case may be, to attend board meetings?—It would be that, Sir.

4562. I only wanted to clear up what your intention was?—I hope I tried to make clear in my earlier answer that we don't want that officer to continuously interfere with details of working, but only with questions of policy.

4563. And it is by that means that you would keep Government in touch with the working of the bank?—That is the idea of the Chamber, Sir.

4564. (*Chairman.*) We have had a very long meeting, and I must express to you our thanks for your very full assistance in the matter.—Thank you very much, Sir. We are only doing our duty. We have got to put our case before you gentlemen.

(*The witnesses withdrew.*)

Mr. Kikabhai Premchand and Mr. Maneckial Premchand called and examined.

4565. (*Chairman.*) Mr. Kikabhai Premchand, you have been kind enough to come and assist us to-day and you are accompanied by your brother, I think, Mr. Manecklal Premchand?—Yes.

4566. You have been good enough to furnish us with a very concise memorandum* setting out your opinions upon the matters referred to us. For the sake of our record might I ask you, Mr. Kikabhai Premchand, from what point of view you drew this up; you are engaged in trade in Bombay?—Yes, as brokers, dealing in exchange, bullion and finance. I would prefer, Mr. Chairman, that you allow my brother to reply on exchange and bullion because he manages the exchange and bullion Department of my firm. As far as exchange and bullion is concerned he will givo a joint opinion.

4567. The general questions I desire to ask on your memorandum should, I understand, be addressed to you, Mr. Manecklal Premchand?—Yes.

4568. You have no doubt been engaged for a substantial period in this form of industry in the city of Bombay?—Yes.

4569. Referring to your memorandum, I will ask you a few questions tending to show the points you lay special emphasis on and to elucidate any matters which may not be at first sight perfectly clear. If I may say so, your memorandum is so precise that it will need very few questions on my part in order to elucidate the matter. You have been good enough to follow the general form of the suggestions as to evidence which were originally put out on behalf of the Commission and to frame your memorandum in the form of answers to the suggestions on the points raised in that memorandum. Taking them in order, I understand it is, first of all, your opinion that, though the time will never be completely ripe for a conclusive solution of such problems, the present conditions are sufficiently normal to permit definite steps to be taken with that view. I understand that you lay special emphasis upon the circumstance of the re-establishment of the relation between the pound sterling and the gold sovereign in England. Let me ask you, Mr. Kikabhai, whether there is, in your opinion, any foreseeable circumstance in the currency or credit situation of the world at large such as might tend to disturb any settlement that was arrived at as regards Indian currency problems, and for which it might be said that it would be prudent to await the result before attempting to establish any new ratio for the rupee or the basis of an Indian currency system?—That is an exchange question; you might kindly address Mr. Manecklal. (*Mr. Manecklal.*) There is nothing at present, Sir.

4570. Secondly, as regards the question suggested as to the relative importance of stability in internal prices and in foreign exchanges, you express the opinion that the main thing to be desired is the smallest possible variation in the prices of essentials within the country; and you look upon this, no doubt, as a factor of more general importance to the people at large than stability in exchange?—Yes.

4571. That is an opinion to which I will refer later in connection with the ratio to be recommended for the rupee. You then analyse with precision the effects of a rising and a falling rupee. Might I summarizo what you say as to that thus, that you are of opinion that the general effects of a rise or fall in the exchange value of the rupee upon trade, industry and the people of the country are temporary effects which vanish as soon as prices and wages have readjusted themselves to the new level of exchange?—Yes.

4572. And it is upon that opinion that you base some further opinions which you express?—Yes.

4573. Referring particularly to the effects of a falling rupee, I understand you to express the opinion that a stimulus is given thereby to the export trade of the country, but that this is only a temporary and artificial stimulus to trade and that it is followed by a period of depression. Is that your experience?—Yes, sir, that is my experience.

4574. Of such movements of the rupee in the past?—Yes.

4575. I understand therefore from your memorandum that this opinion is not only, if I may put it thus, an academic one but based upon actual practical experience of Indian trade?—Yes.

4576. You finally arrive at this conclusion: that you say there is no magical level for the rupee?—Yes.

4577. What do you understand by that phrase, Mr. Premchand? What do you mean when you say that there is no magical level at which the rupee should be fixed?—There is no level at which all problems of Indian finance can be solved. That is why I say, there is no magical level.

4578. I should rather understand you to mean by that that there are, in your opinion, no abstract arguments from equity or justice to lead you to select one level rather than another, but that you must judge the level to be selected entirely on questions of practical convenience and expediency?—Yes.

4579. Indeed as you say, "the desired stabilization should be accomplished with a minimum disturbance of existing economic and financial conditions"?—Yes.

4580. From that I should gather it is your opinion that a disturbance of the existing economic and financial conditions is, in itself, an undesirable thing?—Yes, it is very undesirable.

4581. What weight would you attach, as against the undesirability of that, to any arguments in favour of a higher or lower level than the existing level based upon grounds of some other consideration than immediate convenience?—It will disturb public confidence, which is very essential for a sound monetary system, when thousands of contracts have been entered into; people have got more or less confidence that the present rate will persist. The rate is there.

4582. That rather leads me to the next question I was going to ask. Towards the close of your reply to question (2) A, you arrive at the conclusion that "In view of the comparative ease with which the rate has been maintained at or about 1s. 6d. during recent months, we should suggest that stabilisation at that level would be most feasible." I gather therefore, that your argument as to the undesirability of disturbances, their practical inconvenience, leads you to the conclusion that the rupee should be stabilized at whatever figure it stands at the prosent time, and that is round about the 18d. rate?—Yes.

4583. I gather also that your argument may be expressed rather in this way, that your preference which appears here for the 18d. rate is not based so much upon any positive merits of that rate as the negative merit that there will be a disadvantage in fixing it at any other rate because of the disturbance?—Yes.

* Appendix 23.

10 *December*, 1925.] Mr. KIKABHAI PREMCHAND and Mr. MANECKLAL PREMCHAND. [*Continued.*

4584. Could you enlarge that answer a little by telling us, in the first place, what would be the nature of the disturbances which would be involved in selecting a lower rate than the prevailing rate of 18d.?—It would disturb first of all public finance. The Budget has been based on 1s. 6d. Secondly, this rate has been the basis on which thousands of commercial contracts, both export and import, have been made. Lastly, it would create a lack of confidence in the market and curtail legitimate trade, and these are the practical grounds on which I advocate no change from the present rate.

4585. Let me put to you another point of view. It is this, that the 1s. 4d. rate was a rate that prevailed for long; that long term contracts were entered into at that rate; that the fixation now of another rate than 1s. 4d. would involve a disturbance of the relative burdens under those long term contracts; that the volume of interest under these long-term contracts should be considered rather than the volume of interest involved in contracts entered into at the 18d. rate, and that for that reason the 1s. 4d. rate ought to be selected in preference to the 1s. 6d. rate. Let me ask your opinion on that, especially directing your attention to assisting us, if you can, as to what is the relative volume of interest involved in the still outstanding long-term contracts entered into at 1s. 4d. compared with those short-term contracts entered into at 1s. 6d.?—The 1s. 4d. contracts have run for a very long time, and in my opinion the majority of these have readjusted to present conditions. Accordingly a change from the present level of 1s. 6d. would cause greater disturbances.

4586. It is impossible then to express any opinion as to the relative importance of the interests involved in the long-term contracts and in the short-term contracts. Of what nature would these long-term contracts be—mortgages?—They are very few here on the sterling basis. Most of the mortgages are on the basis of rupees except sterling debt and other Government loans in London.

4587. With regard to a point indicated in your last answer but one, you referred to the almost violent disturbance which has prevailed in the gold value of the rupee since the date when the 1s. 4d. rate has prevailed. That is the disturbance during the war period and post-war period. During that period there were violent fluctuations?—Yes.

4588. If I understand the implication of your answer it is this—(or have I misunderstood it)—that the disturbances already made as regards contracts entered into on the 1s. 4d. basis have been so great that the difference between 1s. 6d. and 1s. 4d. now is comparatively negligible?—Yes.

4589. With reference to your reply (3), let me put to you this question. Supposing the 1s. 4d. rate were to be selected for stabilisation now, have you been able to consider by what financial process that rate could be re-established, and what it would involve?—Well, it will involve a heavy loss.

4590. That is rather a consequence of the process. I was directing my attention for the moment to what steps could be taken in order to put the rupee upon a 1s. 4d. basis. How would one set about it if one selected 1s. 4d.?—Once it is definitely announced that 1s. 4d. is to be introduced the market rate would slump at once to 1s. 4d. It could not possibly remain at 1s. 6d. or even 1s. 5d.

4591. It would follow from that that any attempt at a gradual readjustment would, in your opinion, fail?—Yes. If people knew that 1s. 4d. is to be the official rate speculative activity would immediately depress the rate to that level.

4592. Will you describe in a little more detail from your practical experience (which would be of special interest to us) what would happen if Government stabilised the exchange at 1s. 4d.?—At once when the result is known in the market there will be a rush to buy exchange, especially from importers; at the same time exporters would hold off and internal prices would be so disturbed that there would be an immediate rise in all commodity prices. Such a move would disturb the equilibrium of financial machinery in the country.

4593. What will be the disturbance to prices?—Internal prices would go very high.

4954. Supposing things go as you describe, what would happen as regards the rate to which the exchange would fall? Would it be easy to keep it at 1s. 4d.?—If Government establish 1s. 4d. and sell councils and reverse councils, it may be able to keep it at that.

4595. You suggest to me as a possible consequence that the rate might go even lower?—Yes.

4596. What would be your opinion on that?—If Government is not selling reverse councils, the rate might go even lower than 1s. 4d. temporarily; but as our balance of trade is generally favourable it would rise again and if Government did not sell council bills at the upper gold point, the rate would rise further.

4597. It would put it up to your fixed rate?—Yes.

4598. That suggests the possibility of market fluctuations before it settles down?—Yes, because a lower rate creates, first of all, a demand for rupees.

4599. Supposing we take the converse picture and contemplate the possibility of fixing the rate higher than the present rate, what practical measures should be adopted to raise the rate of the rupee?—That means Government will have to refrain from operating at the present rate.

4600. Some measures would have to be taken. Supposing it was fixed upon a higher rate—(let us take as an illustration 1s. 8d.)—how would the machine have to be worked in order to raise the rate to that point?—You should sell first of all reverse councils to bring up the market to that rate, and then it is doubtful if the rate could be maintained at the higher level.

4601. Just as in the first case you would have to take some measures for increasing the internal currency, so in this case some measures would have to be taken for reducing it?—Yes.

4602. What effect would that have on prices?—Fall in prices.

4603. In your opinion, would it be as quick; would the consequences work out as quickly as they would in the case of a falling rate?—The consequences in the case of a falling rate will be quicker.

4604. In this case the adjustment will be small, and therefore the less harmful?—Yes; but I prefer the present rate.

4605. I am only asking these questions in order to see what the justification is for your view that the 18d. rate should be chosen in order to avoid disturbances. We were examining what the disturbances would be. Now we come to the next heading of your recommendations with the leading question, "what measures should be adopted to maintain the Rupee at the rate selected?" The procedure which you recommend is practically the pre-war procedure?—Yes; the pre-war procedure in preference to the present procedure of sterling purchases in India through the Imperial Bank.

4606. Will you amplify that answer by telling us why you prefer the older procedure of councils and reverse councils to the new procedure of the purchase of sterling in India?—The purchase of sterling in India means that the official rate of 1s. 6d. is available; that is the rate at which Government is buying sterling. What has happened now is that exporters are holding off and saying, "we can sell, whenever we want, to Government at the higher rate." This attitude spoils business.

4607. I do not think I quite follow that for the moment. What is the adverse effect upon business of the new procedure?—Merchants hold up their bills right until the due date. In the old days every Wednesday there was a sale of council bills, and merchants sold their bills at any time during the week, except on Wednesdays.

4608. Would it, in your opinion, be any remedy for the disadvantage if the purchase of sterling in India

were to be by tender instead of by private treaty?—That would be better; but I think council bills in London or sterling purchase in India by tender are both equally good.

4609. Assuming the adoption of the tender system, you would not see anything to choose between the two methods?—Not much. But I think sale of council bills in London would be the better of the two.

4610. What would be the still remaining advantage in the method of the sale of council bills?—In the case of council bills you will have to have council bills not only at the various centres in India but you must consider the many foreign countries dealing with India; London, being the most central market, would be most convenient.

4611. That is really a practical difficulty in the way of applying the tender system in India?—Yes. It will have to be at 5 centres, Rangoon, Karachi, Bombay, &c.

4612. In the days of the electric telegraph, is there any great difficulty in that?—Still there is.

4613. What is the nature of the difficulty?—The time element; we would not get the results quickly enough. What about the foreign countries? They would have to send an application the previous day. A lot of American jute contracts are made and they would apply for councils. It is obviously more convenient to apply for councils in London.

4614. So that, in general, you suggest no other substantial changes in the pre-war system, but your recommendation on this point is the re-establishment of that system and the fixation of the ratio as you have it now?—Yes.

4615. With reference to the size of the reserves to be kept, would you tell us what makes you adopt the figure of 50 millions?—Yes, Sir. I based it on the maximum adverse balances of trade during the last 15 years.

4616. Then you recommend that the control of the note issue should be transferred to the Imperial Bank. There is a word which I have a little difficulty in apprehending. You recommend that there should be a *gradual* transfer. What had you in your mind as a gradual transfer?—Because people up-country, when they see a change from the Treasury issuing notes, to the Imperial Bank issuing notes, they might have some apprehension. That is all I meant. This is why I say "gradual."

4617. Gradually as regards the steps to be taken?—Yes, as regards steps to be taken.

4618. Is it your view that the transfer should be a definite transfer of control so that the notes become the notes of the Imperial Bank?—No, Government of India. The bank act as they act in the public debt office as the agent of the Government.

4619. But the actual management and control of the reserves, the support of exchange and so on, including the work of Government remittance to which we refer elsewhere, should, in your opinion, be remitted to the management of the Imperial Bank?—Quite.

4620. But you would preserve in form the notes as notes of the Government of India?—Yes.

4621. Is that with a view to avoiding any disturbance in the habits of the people with regard to the note issue?—Yes, that is it.

4622. I think it would be of advantage if you could assist the Commission with any suggestions based upon your practical experience as to what further facilities are desirable as regards the encashment of notes?—(*Mr. Kikabhai Premchand.*) Of what nature?

4623. You say: "The Imperial Bank of India should be given wider powers and larger balances to facilitate the encashment of notes. The present system of cashing them at Currency Offices is cumbersome and troublesome." "Larger balances" is one point; what wider powers had you in mind?—I mean the issue of notes. If the system is transferred from the Currency Office to the Imperial Bank, then the whole question will be settled and they can give all facilities. The small notes——

4624. I will take that as a separate question. As regards the wider powers to which you have referred, they would be adequately conferred by the control of the Imperial Bank to which you have referred?—Yes.

4625. Then we come to the point of the one rupee note. In your opinion is it desirable or otherwise that the issue of the one rupee note, or of notes less in denomination than Rs. 5, should be continued or stopped?—Re-introduced. They have stopped it now.

4626. I understand you think that is a mistake?—(*Mr. Kikabhai Premchand.*) I think so.

4627. What is the advantage to be gained by it?—It teaches the general public to use currency notes, particularly the ryots and other people of that class.

4628. It is a measure tending towards popularising and increasing the note circulation?—Yes.

4629. Your opinion as to the desirability or otherwise of a gold currency, as expressed in your reply to question (6) A, is that "while the use of gold as currency is highly desirable, it is not practicable at the present time, in view of the widespread habit of hoarding. It can only be gradually introduced over a period of years." Could you amplify the answer on that very important topic. How would you expect the widespread habit of hoarding to react upon any attempt to introduce a gold currency?—(*Mr. Manecklal Premchand.*) At present, if gold coins are given in exchange for notes, people would simply bury them.

4630. Your view is that, the more gold is available, the more it would go into hoards?—Unless gradually people learn the habit of investment; then it will gradually decrease.

4631. Let me suggest there another point of view, which is perhaps the converse of that. Supposing it was said that, by making gold available freely in circulation, you would inspire so much confidence in the stability of values that people would no longer want to hoard, what would you say as to that suggestion?—People have always wanted gold in India for hundreds of years. They will not give up the habit so quickly whether gold currency is introduced at once or not. There is another danger. The moment you give gold against notes they will also bring rupees and ask for gold coins. All the rupees already hoarded would come out.

4632. You would say that the making available of gold for currency, and perhaps eventually, as you suggest, gold for rupees and notes would have no effect in educating the people, and in restoring such a spirit of confidence as to educate them out of the habit of hoarding?—Ultimately it will reduce hoarding when people know that gold is available against notes, but the first rush is going to be a very great one.

4633. You tell us that the gold hoarding habit is such an inveterate habit with the people of India that that must be a slow process?—Yes, I think the habit is very strong here.

4634. Now let me ask you what you expect would occur supposing one were to offer, as one measure towards the introduction of a gold currency, to give out gold coins freely against rupee coins?—I think rupees would pour in to the currency office in very great numbers.

4635. What effect will it have on those who hold rupees in hoards?—They will bring out their rupees and substitute gold coins in their hoards.

4636. Do you expect that effect to be widespread and continual, or do you expect it to be local only and to cease as soon as it was seen that gold was coming out? I am asking you questions which I realise are difficult because they involve your opinion on what the state of mind of the Indian public is. These, of course, are matters upon which the Commission needs illumination?—(*Mr. Kikabhai Premchand.*) If people know they are sure to get gold the habit of hoarding may gradually diminish. At first there will be a rush.

4637. Have you ever attempted to make an estimate of the amount of gold which might be required under such conditions in view of the total amount of rupees outstanding and so on?—(*Mr. Kikabhai Premchand.*) Required by the Government for coining?

4638. Let me put it in this simpler way. Have you ever interested yourselves in making any estimate as to the total number of rupees still outstanding?—(*Mr. Maneckklal Premchand.*) The rough estimate is about 300 crores.

4639. What is your estimate based on?—We take the Controller of Currency's report as to the rupees minted and issued during a period of years. The rupee being a token coin nobody melts it, so they must be in the country though we do not know where. The moment people know gold coin is available they will make their appearance. Whether all will come out is a question, but undoubtedly many of them will.

4640. Recognising, of course, that a certain large amount will still be required for circulation?—Yes.

4641. You say the policy of minting gold in India should be a free exchange of gold bars for sovereigns and *vice versa*, a reasonable charge being made by the Mint. I rather gather from the opinions that you express that you would not expect the result of the establishment of a Mint, with free coinage, subject to a reasonable charge, of gold bars to result in the passage of any large quantity of gold into circulation under present circumstances?—It will not bring any large quantity of gold into circulation but many gold bars will be converted into gold coins. People will convert the bars into coins and keep them.

4642. And then, as you told us, the gold coin will go into hoards?—But possibly after an effective gold standard has been established for some years they may again circulate.

4643. Have you given any consideration to what you would look forward to as the ultimate ideal of your recommendations? You express the view that the use of a gold currency is highly desirable. Let me put it in this way; you recommend the establishment of the pre-war system?—Yes.

4644. I rather gather that you do not recommend the taking of any further steps with a view to the encouragement of the use of gold as a currency under present conditions?—Under present conditions we do not.

4645. You would wait for that until the habits of the people as regards gold hoarding have been improved?—Yes.

4646. Would you look upon it as a relevant circumstance in that connection to consider the habits of the people as regards the increased popularity of notes as a form of currency?—Yes, I would.

4647. In your opinion is the use of notes increasing among the uninstructed people; are they getting more confidence or not?—They are getting more confidence in the notes now than in the pre-war days or say 20 years back.

4648. What would you say to the suggestion that, if you waited long enough—(you recommend waiting)—you would arrive at a time when the people of India were so used to the use of notes that notes would have become the circulation of India. Under those conditions would there be any advantage in looking forward to the substitution of notes by gold currency or not?—The more notes people use and the less gold coin, the better. Until such time as people acquire the good habit of keeping notes and trusting them thoroughly, there may be some difficulty; but eventually it should be practicable.

4649. I do not quite follow that. Would you prefer to have gold in circulation rather than notes?—I would have notes rather than gold.

4650. If you have notes then you would not trouble about gold for circulation?—No.

4651. This opinion of yours which I have explored is really summarised in your phrase that it is your conviction that "a gold standard should be gradually introduced concurrently with determined efforts on the part of the Government to discourage the hoarding habit." That is what you have amplified now with the answers that you have just given me. I am not sure, but are you perhaps missing some suggestion that you might care to make in connection with the sentence: "We have in mind a practical scheme"?—(*Mr. Kikabhai Premchand.*) I should issue post office certificates repayable say after 3 or 5 years at a lower rate of interest than at present but repayable in gold, with the restriction that they should be paid in gold coin only when cashed on due date. If demanded earlier then they must be paid in notes or silver. Such a scheme will educate people to the possibilities of investment, satisfy their craving for gold, and by creating a good demand for post office certificates, place at the disposal of Government a large supply of funds now hoarded.

4652. Is there nothing of that sort now?—No, not in gold. When you make the announcement advertised widely that certificates will be repayable in gold at maturity it will be a very great attraction for small investors, and gradually the limit should be increased from Rs. 10,000 to perhaps Rs. 20,000 or Rs. 25,000.

4653. What is that limit?—The limit to be issued to one individual.

4654. In order to encourage the investment habit and to teach people that there is something better to do with gold than to hoard it, you would issue, through the Post Office, a gold certificate repayable on a due date in gold?—That is so.

4655. What will be the duration?—Three or 5 years.

4656. As much as that?—I am just trying to give a tentative idea of what we mean. You may have any other period suitable to Government.

4657. Do you think there would be much demand for a 3 years gold certificate?—Possibly.

4658. Would not people have to get some experience first that they are going to get their gold back?—The term could be reduced to two years.

4659. These certificates would not go well until they had begun to fall due and people had begun to find out that they actually could get repayment in gold?—Until then the demand will perhaps not be very big, but when they are convinced they will come in a rush for it.

4660. Just to encourage the market you would not begin with shorter certificates?—No, not shorter.

4661. You think that would be impracticable from the point of view of Government?—No; I would put it at three years or two years at the minimum.

4662. Towards the end of your memorandum [question (8) (B)] you say: "The present provisions of the Paper Currency Amendment Act, under which currency notes are issued against hundis, is quite satisfactory and we do not consider a revision of these conditions necessary." Do you consider the nature of the securities against which emergency currency can be issued is incapable of improvement by extending the list or making liberal provisions as to the sort of securities which can be discounted? That is one point. The other is as to increasing the amount to which emergency currency can be allowed against securities?—I think the present amount is quite sufficient, and present provisions adequate.

4663. In your experience, the present provisions of the Paper Currency Amendment Act provide a scheme which gives reasonable and adequate elasticity to deal with the seasonal demand for currency?—In the present circumstances, yes.

4664. (*Sir Purshotamdas Thakurdas.*) You said just now that for introduction of gold standard you would wait until the people of India learnt not to hoard. How long do you think you would have to wait for that?—It may be many years before they have learnt not to hoard.

4665. The best part of half a century or a century perhaps?—I do not think as much as that.

4666. In how many cases do you think they will begin to forget this habit of what is called "hoarding"?—It is very difficult to say.

4667. But you do think that a gold coin should be put on the market?—I think it should.

4668. Mr. Maneklal Premchand gave us a practical scheme just now as to how a gold coin could be put

on the market. How do you think then that Government could discourage the habit of hoarding? You say in (6) (B): "It is our conviction that a gold standard should be gradually introduced concurrently with determined efforts on the part of Government to discourage the hoarding habit." What sorts of efforts on the part of Government to discourage the hoarding habit have you in mind?—One is the investing habit through the Post Office Certificates; the other is that coins should be issued without any obligation on the part of Government; that is coins or notes or rupees should be issued as in pre-war days. Government would undertake to give sovereigns only when they are available and they would not give them when they were not. In this way people would get more and more confidence, that although the Government were not bound to give gold coins always against their notes, they could still get coins occasionally and they would thus be discouraged from hoarding.

4669. You recommend that?—Yes.

4670. Have you any idea how people will utilise this option which government gives them? Will there be more rush for sovereigns than before the war?—They always take it in the season, quite a big amount.

4671. Was there any rush on the part of people to hasten with their rupees and get them changed into sovereigns?—Such an occasion did not arise, because sovereigns and rupees were fully available.

4672. So would rupees also be available when gold standard is introduced: it is not proposed to discontinue the rupee: why do you then think that people will rush with their rupees to get them changed into sovereigns hereafter?—Because for all these years since 1914 to date the people have not had any coins officially given to them; they have imported it as a commodity and therefore the first temptation would be to exchange it; ultimately it will subside; it would be a rush only at first.

4673. Do you not think they would take the bullion to the mint and ask it to be minted?—Yes.

4674. Which is more likely, that they would take bullion to the mint or that they would take their rupees and ask to have them changed?—I think the rupees in greater number would come to the mint to be changed into gold, and next to that would be the change of bars into gold coin. If this is gradually done, then fewer rupees would come.

4675. If Government instead of legally undertaking to change the rupee into gold said they would do so when it suited them?—The rush would be more gradual.

4676. Regarding the contracts for produce which have been entered into, affecting the question of ratio of exchange, you said in reply to the Chairman that there would be a great upset in the financial conditions, because a number of contracts have been entered into in connection with the sale of cotton and seeds for export?—Almost all produce in India.

4677. You have in your mind that this is the middle of the season, or rather the beginning of the season, I think, and people have got commitments for sale, and their contracts are not complete because the produce has not been exported; is that what you have in mind?—No; not even foreign merchants leave their contracts open as a rule; although they do not necessarily close the exchange and produce contracts simultaneously.

4678. When an exporter sells his produce and leaves his exchange contract open, is he not speculating?—Yes. He cannot get away from such speculation entirely, but when government is committed to a definite rate of 1*s.* $6\frac{3}{16}$*d.* he more or less relies on its stability.

4679. He could avoid that risk, could he not?—In some cases he could; but sometimes he could not

4680. Is it absolutely necessary for him to leave his exchange contract open?—Not absolutely necessary; but sometimes he is compelled to do it.

4681. Why?—Because he may sell to Europe for a delivery in October; the goods may not come; he may be forced to cancel his contract on the other side, which would leave him with an exchange contract outstanding.

4682. Then, will you oblige me by letting me know if you can sell and buy exchange for the next twelve months or not?—We can.

4683. Then, how does the question arise?—Because contracts are generally for a particular month only; you cannot make a contract delivery December to next June, it is not allowed.

4684. That is as far as the bank is concerned?—Yes.

4685. Do you think the buyer on the continent buys with six months option to the seller here?—No.

4686. He also stipulates shipment?—Yes.

4687. Therefore for all practical purposes the shipper knows what time about he will have to present his documents?—He knows approximately, but he may get extensions there.

4688. He could get extensions here also with a slight penalty?—Yes.

4689. Therefore he need not take the risk of exchange?—Not necessarily.

4690. Those exporters who take this risk of exchange choose to take it either for profit or for something else. Would you therefore say that their interests require serious consideration?—We do not say the interests of any man who speculates requires special consideration.

4691. Then will you tell me what financial conditions you had in mind which you are afraid of disturbing by altering the ratio from 1*s.* 4*d.* to 1*s.* 6*d.*?—We will have a big rise in the price level here, and the budget would be disturbed.

4692. I propose a little later to ask *re* the rise in the price of commodities and economic disturbance: I am at the moment thinking of the disturbances in the financial conditions?—Importers who have made purchases abroad but have not fixed their exchange would be very much disturbed. There may be again a repudiation of contracts as happened at the time of the 2*s.* fixing; that danger may recur.

4693. Any other that you have in mind?—National finance would be disturbed, the Government of India's budget.

4694. These are the main ones?—Yes, all that I remember now.

4695. Now, regarding economic disturbance, you have in mind disturbances to the price level, or have you any other thing else in mind?—Yes; rise in general prices which would tell very bady on the people who receive fixed incomes.

4696. This rise or drop in general prices which always follows a change in the ratio, is it felt by the people?—It is felt.

4697. When does it cease to be felt by the people, at what stage? Does it continue to be felt by the people or is it felt only for a stated period of time?—It would be felt for a long time.

4698. For how many years would it be felt?—If wages rise in proportion, not for a long time; otherwise for a very long time.

4699. Can you tell me approximately the number of years, one, two or three, or would it be six months or so?—I could not say exactly.

4700. Do you think that the disturbance caused by the change from 1s. 4*d.* to 1s. 6*d.* is still in existence, or whether it has ceased to operate in the economic conditions and price levels?—It has more or less settled down; prices have adjusted themselves to the present level.

4701. And when did the change from 1*s.* 4*d.* to 1s. 6*d.* take place?—The change from 1s. 4d. to 1s. 6*d.* took place for the last several months.

4702. So it has taken only a few months to settle down?—Yes; a rising rupee after all does not do so much harm as a falling rupee.

4703. A falling rupee does harm?—Yes.

4704. More harm to the consumer?—Yes; to the country as a whole; particularly to the consumers.

4705. A falling rupee does harm to the consumer, and does harm for a longer period than a rising rupee does. What about the harm to the

agriculturist?—The agriculturist is not very much harmed because he gets far more price for his produce than he got in pre-war days; he has been getting much better prices for his produce than he was getting when the rate was 1*s*. 4*d*.

4706. If he was not getting that, the rise would hit him?—If he was actually losing by it, Government would consider it.

4707. It does not matter about the Government; kindly tell us what you think; kindly oblige us with your view. If there was no rise in the world prices, you would be opposed to a rise in exchange from 1*s*. 4*d*. to 1*s*. 6*d*. because the cultivator would lose by it?—If the cultivator actually lost I would be against it.

4708. In this case there has been an advance in world prices?—Yes; and they are getting more rupees for their produce.

4709. Therefore in your opinion the agriculturist is one of the most prosperous men going in India to-day?—I think so.

4710. What about industries as affected by the rise in the ratio?? Do you think the industries also continue to flourish as well as the agriculturist?—Those industries that have to compete with foreign goods do not; the rest are not affected.

4711. That is mainly the cotton industry?—The cotton industry in particular is very well established in India, and they are not effected by the exchange.

4712. Is that industry not affected by the exchange?—I do not think so.

4713. Whether the exchange was at 1*s*. 8*d*. or 1*s*. 2*d*., the cotton industry would not be affected?—(*Mr. M. Premchand.*) No, Sir, I think the price of raw cotton would vary in terms of exchange.

4714. And therefore the industry would get the *quid pro quo*?—They would get the benefit of the price of cotton.

4715. Therefore in your opinion a rise or fall in exchange does not affect them?—A fall in exchange might affect them.

4716. How?—Because they have not only to use cotton, they have to use a lot of other material than cotton for the manufacture of cloth and yarn. There is the sizing, chemical stores, and so many other things. Only 60 per cent. is cotton, the rest is imported stuff, machinery, etc., on which the costs would be relatively higher.

4717. Therefore, a fall in exchange would prejudicially affect the cotton industry?—A sudden fall, yes.

4718. A gradual fall would not matter?—Well, things would then have time to adjust themselves.

4719. Anyway a fall in exchange is not desirable?—Not so far as the cotton mills are concerned.

4720. And a rise in exchange?—A further rise in exchange under present conditions would also affect them.

4721. But the rise in exchange to 1*s*. 6*d*. has not affected them?—In my opinion it would not affect them.

4722. I have finished with Mr. Manecklal. I would like to put one or two questions to Mr. Kikabhai. Mr. Kikabhai, you are Agent for several leading Indian States in Bombay, and you happen to be their financial agent here, lending for them substantial amounts on various industrial and other enterprises in Bombay?—Yes.

4723. Through you a very large sum of one crore of rupees has been lent to one public Company in Bombay?—Yes.

4724. (*Sir Purshotamdas Thakurdas.*) Would you tell us—you need not give the names if you don't want to.

4725. (*Chairman.*) We must be careful not to ask Mr. Premchand any question that will embarrass him.

4726. (*Sir Purshotamdas Thakurdas.*) I am only asking him to lay before the Commission things which are generally known in Bombay—he need not give the names if he does not want to.

4727. (*Chairman.*) We must exercise the utmost care, of course, not to embarrass the witness.

4728. (*Sir Purshotamdas Thakurdas.*) Can you tell us what the inclinations of Indian States are regarding hoarding—or what is called the hoarding of precious metals?

4729. (*Chairman.*) Sir Purshotamdas, just before the witness replies, he might not realise that, although our proceedings to-day are confidential, ultimately all the evidence will be published?—(*Mr. Kikabhai Premchand.*) Of course, I quite realise that, Sir. What you mean is whether they keep a good deal of hoarded gold or not?

4730. (*Sir Purshotamdas Thakurdas.*) Do they keep a lot of precious metal in their treasuries?—To a certain extent.

4731. What is their motive, what is the special reason which leads them to do this?—They want to keep that gold because they know that otherwise when they are in immediate need of it they may not get it. They want to keep a certain amount of gold always in the country.

4732. Why do you say they may not get it? Bombay and Calcutta are fairly near?—They may desire to have it on hand when they need it urgently for their own purposes. They might not satisfactorily realise on their investments if obliged to dispose of them.

4733. In order to enable them to carry out their responsibility to their people? Have there been any years when they have sold out their hoards?—No, there have not. That is their underlying idea. To use it in an emergency.

4734. Do you think they are likely ever to part with their hoards which have been laid in with this underlying idea?—Yes, when an effective gold standard is introduced or when they know that they will get gold against currency, they may realise their hoards in exchange for sovereigns.

4735. Is that likely also to go further and they may keep nothing thinking that they can always get it freely?—Well, it depends upon their views at the time. I think they would always keep a certain amount.

4736. They would keep a certain amount in any case?—But they would not keep as much perhaps as they have been keeping hitherto.

4737. You mean that their hoards would be reduced?—Yes.

4738. Have you found any great disposition on their part to invest in industrial enterprises lately? Have they been getting increasingly disposed to invest in industrial enterprises?—I think so.

4739. Steadily increasing tendency. Is there anything special that you think can be done regarding the Currency Policy of the Government of India to induce them still more in this direction?—You mean currency policy about exchange?

4740. No?—I think if they are assured that they will get gold against their currency they will probably reduce their hoards.

4741. Do you think these Indian States have more silver rupees hoarded or more gold hoarded? I mean within the last six months or so?—More gold. Silver also but less of it.

4742. The quantity of silver is diminishing and the quantity of gold is increasing?—Speaking generally. I want to put it this way. I am giving you my views about all the native states, not particularly about my clients. This evidence may be published and they might think I am giving views about their private affairs.

4743. (*Chairman.*) You understand very well that it will be published?—Yes. I just wanted to note down that I am giving you my opinion about the native states generally. That is my belief about all the native states in India. I am not referring particularly to the people with whom I am concerned.

4744. (*Sir Purshotamdas Thakurdas.*) Which of you, Mr. Kikabhai, is connected with the bullion exchange here? Wasn't one of you chairman?—No, my brother is a member of the committee of the bullion exchange here, not I.

4745. Would you, Mr. Manecklal, mind telling me whether, when you had a gold coin in India, I mean before the war, trade in gold bullion was as brisk as it is to-day—dealings in gold bullion?—Dealings in gold bullion were comparatively smaller than they are to-day for the reason that the price of gold was more or less fixed and there was no speculation in gold to the extent that we have seen recently. There was more or less stable gold price throughout the year at Rs. 24 a tola and huge imports of gold came in the shape of small National Bank bars, or Chartered Bank bars or other bank bars, 10 ounce bars. Apart from that there was not such a big trade.

4746. That is more due to the fluctuations of the gold rate?—That was one of the reasons. But another important reason was that sovereigns were very convenient. People took them as coin. They thought this way: This is a coin as well as gold, and when we want it we can realise on it irrespective of the bullion market.

4747. Therefore, when gold currency is available, trade in gold bullion is on a smaller scale than otherwise?—Now last year private imports on account of gold went up to something like rupees 60 crores.

4748. You imply therefore that, if gold coin was available the imports on account of private individuals last year would not have been as big as this?—They would certainly have been less if we had a fixed rate for gold and coin.

4749. You mean fixed by statute?—Yes.

4750. (*Sir Norcot Warren.*) These hoards that you talk about in the Indian states, don't they keep a large part of their surplus in Government paper?—(*Mr. Kikabhai Premchand.*) They do.

4751. On which they get interest?—Yes.

4752. And when they are in a tight corner, they can go to the banks and get loans?—Yes.

4753. Then why should they keep hoards of money?—They keep gold so that in case of a crisis they may not have to sell their Government paper.

4754. I do not mean sell—I mean a loan?—Well, even loan. They don't want to pledge it to the bank.

4755. Why not?—They do to a certain extent but some of them don't. That is why they keep gold as far as they can, to be used when an emergency arises.

4756. (*Sir Alexander Murray.*) You were referring to the large speculation that was going on in gold just now within the last year or so. Has that been due in your opinion to any extent to the possibility of exchange going back to 1s. 4d.? People want to gather stocks of gold at the 13½ ratio in order to realise 15 rupees for them later on?—(*Mr. Manecklal Premchand.*) Yes. That has been one cause, but not the only cause. They considered the price was very cheap as compared with the pre-war price and they said, if by chance exchange went to 1s. 4d. we would make a profit.

4757. (*Sir Maneckji Dadabhoy.*) What is the practice in your market here? Generally for what periods are these contracts entered into?—(*Mr. Manecklal Premchand.*) Contracts of what, Sir? Exchange?

4758. Yes?—Contracts of exchange are entered from the monsoon months right on to the next year's monsoon. Practically from July to June of next year.

4759. Just about 12 months?—9 months.

4760. Are there any contracts under the old ratio scale subsisting?—I don't think there are any contracts subsisting now.

4761. You have stated that any abrupt change would certainly cause serious consequences, while we doubt if even a gradual but marked alteration of the present rate could be accomplished without disrupting the financial machinery of the country. Now could this disturbance of the financial machinery of the country be averted by Government issuing timely notice to say that they propose to bring this ratio of 1s. 4d. or 1s. 5d. or any lower ratio into operation at any particular date, 6 months or 12 months hence?—The financiers and merchants and banks have such enormous coins that they would anticipate Government's dates and immediately take advantage of the market. Once it is known that 1s. 4d. is coming, the rate will go there, whether you announce it or not.

4762. Even if you gave time?—Even if you gave twelve months' notice, it would not do that.

4763. Now two great industries of this country, as I understand, are, apart from agriculture which is not referred to at present, the textile and the coal industry. My friend, Sir Purshotamdas, has asked you questions about the textile industry. May I know how this higher rate of exchange would affect the coal industry? Have you thought over the matter?—Yes, Sir, I have. The export and import of coal is very small. British India statistics prove that. I mean that while the total trade of India is about 600 crores, the total foreign trade in coal amounts to rupees a crore or two crores.

4764. And what about the internal price of coal?—With a higher rate of exchange foreign coal would compete, but you have a duty on imported coal, I mean against dumping and so on.

4765. At present we have only 8 annas a ton?—I think the Tariff Board is considering the matter.

4766. I want to know what effect the higher rate of exchange will have on internal prices?—It will put the coal industry in competition with foreign coal.

4767. What rate will put it?—A higher exchange would.

4768. (*Sir Henry Strakosch.*) I wanted to ask you about the bullion market in India. Very large quantities of bar gold have been bought, especially during the last year. I would like to know a little how the gold introduced into India is retailed and dealt with, all over the country. Could you give us a short description?—Gold bars are imported by the bullion dealers of Bombay through the Exchange Banks here. First they buy the gold through London brokers. The bars are imported here by the Exchange Banks, mostly British or some foreign Banks. When these bars arrive, banks give ten days' time to pay for those bars. Within the ten days they most probably dispose of the gold unless the demand is slight. Some of these bars are cut into pieces in Bombay and sold retail. Some of the bars are railed upcountry in boxes and they go there for distribution in the upcountry markets, while the small bars of the National Bank or the Chartered Bank are not cut into any pieces; they are sold as whole bars.

4769. So that it is hardly possible for a speculative position to exist in gold because the buyer has got to pay 10 days after the gold arrives here?—He buys the gold for 10 days' delivery and he sells forward in the market. On the 10th day he may go to his banker and ask for a loan.

4770. So are there big loans running on gold?—Enormous. Last year some crores of rupees were locked up in gold. The Imperial Bank was flooded with gold.

4771. Could you give an estimate of the position to-day? Is there much gold pledged to the banks against loans?—Not so much, because the prices have been more or less stable and the local price has been under the importing price, under parity as we call it.

4772. Which rather indicates that they had overbought?—Last year they anticipated their requirements for at least a year or so.

4773. Can you tell me to what extent you think these purchases have been made on really speculative account in anticipation of the fixation of the rupee at a lower point than it stands at present? Can you give us an estimate of that?—You see they were talking in the Press that 1s. 4d. would come, and the Bazaar had rumours that 1s. 4d. was coming till the Budget last year when the Government announced 1s. 6d. as their Budget rate. People were always thinking that there would be some miracle coming and speculators were always attempting some sort of plan to push up the rate. Bombay merchants are always ready with the gold in hand. They are

the biggest holders of stock and the biggest dealers. So they always for their own interest spread some sort of rumours here to raise the price. I could not say that it was exactly due to that alone: the price was cheap and there was an idea that 1s. 6d. would not come. There is no risk of a drop in the rate of gold because exchange is pegged at 1s. $6\frac{3}{16}$d. and therefore buying gold is a good speculation.

4774. All then that they had to lose was the interest to the Bank, and there was just the chance of making $12\frac{1}{2}$ per cent. if the rate went down to 1s. 4d.?—Yes.

4775. You could not say more except what you have indicated that gold now internally is lower than the import point?—At present it is.

4776. That rather indicates that there was an over-bought bull position of gold which for one reason or the other had to be liquidated?—Yes.

4777. And that the bull position still continues?—Yes.

4778. Then I have one question to ask on a totally different subject. In this country the paper note and the rupee, or as it is very often called the note printed on silver, circulate side by side. In the past the note has been convertible into rupee coin. Both are tokens?—Yes.

4779. The only difference between the one and the other is that the one is printed on very cheap material and the other is printed on an expensive material. But their internal and external value depends entirely upon the stabilization of the gold value of the rupee through the exchange?—Yes.

4780. Therefore in fact there is no difference between the two classes of notes?—No.

4781. What I wanted to ask you is this. In the circumstances, is there any particular reason why the note token printed on paper should be exchangeable into the other token printed on silver? Would you consider it an essential condition that the rupee note printed on paper should be exchangeable into the rupee note printed on silver?—It should be made exchangeable.

4782. But why?—That is only a mere bit of paper, as many ignorant people call it, and as to the other they say it at least has some apparent value, some bullion value. Of course to anybody recognizing the stability of the Government and the paper currency and all that, it is absolutely more convenient than the silver rupee.

4783. You say that, because of popular prejudice or popular ignorance, you would consider it essential to make the paper note convertible into a rupee note?—Yes.

4784. (*Chairman.*) Is there any particular point on which you wish to supplement your memorandum?—No.

4785. (*Chairman.*) I should like, on behalf of my colleagues, to say that we are very much obliged to you for your very full assistance to-day.

(*The witnesses withdrew.*)

FOURTEENTH DAY.

Friday, December 11th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, (*Joint Secretary*).

Mr. PHIROZESHAH MERWANJEE DALAL, called and examined.

4786. (*Chairman.*) Mr. Phirozeshah Dalal, you are kind enough to assist tho Commission with your evidence. Are you engaged in business?—I am a broker, Sir, in exchange, finance and bullion.

4787. In the city of Bombay?—Yes.

4788. You have provided us with a very full memorandum* to assist us in our preliminary apprehension of your opinions. I would, if I may, ask you a few elucidatory questions on your memorandum which are all directed to testing the opinions which you express and do not imply the adoption of any particular point of view on the part of the questioner. They are only put in order to understand your opinions in their full strength. Let me direct your attention to the first paragraph. In the first paragraph of your memorandum headed "questions 1 and 2," referring to the effect of the recent rise in exchange, you say that "agricultural industries have not felt the strain to the same extent as manufacturing industries owing to the high world prices for certain raw products"; but you further express the opinion that "they also will feel the effects in the years to come." May I ask you what consequences you forsee in that expression?—The opinion has been expressed that as the gold standard is established in various countries and that if it is extended to other countries it will have the effect of lowering gold prices. Therefore agricultural products of India will not realise the same prices as they have been doing in the past few years.

4789. You are referring to a loss of the benefit to which you refer from the rise in general gold prices rather than to any consequence still to work itself out in adjustments of the rise in exchange. If I may try and make my question a little clearer, this is your view, as I understand it, that there is a bad effect upon the agriculturist owing to a rise in exchange, and a good effect owing to the shift in general world prices; and further consequences which you foresee are a loss of the good effect owing to the shift in general world prices and not to any further working out of the direct consequences of

* Appendix 24.

the rise in exchange?—Yes; also prices of certain commodities have been very high during the last few years, like cotton, owing to the shortage of crop in America. But we cannot expect such prices to last. We exported a 100 crores worth of cotton last year; we are not going to do that always. Already the price of cotton is down, nearly Rs 100 per candy from last year's price.

4790. I think that is really another aspect of the general conclusions to which you have already referred. What importance do you attach, from the point of view of the agriculturist, in connection with the fall in the price of cotton, to the counteracting benefit which he would obtain from a cheaper price for whatever cotton cloth he has to buy?—The public generally and the agriculturist will benefit from the cheaper cloth; but I do not think India will realise the prices she has been realising in the last few years; that is my point.

4791. For the cotton which she grows?—Yes.

4792. Now we pass on to paragraph 2 of your memorandum where you refer to the disastrous consequences of a move of exchange upon Indian industries. I do not quite follow the conclusion in your next paragraph, in which you draw a conclusion against the stabilisation of exchange at 18d. One must distinguish, must one not, between the consequences of a shift in exchange and that in respect of the maintenance of exchange at a given level. Can you make it clear to me why the disastrous consequences which result from the transition upwards are an argument against maintaining the higher rate once the transition period is over; or perhaps that is not your contention?—You mean the third paragraph, Sir?

4793. Yes. I follow that that would be an argument against a further rise in exchange, but I do not quite follow why they are an argument against staying where we are?—The effect of staying where we are will be felt for many years to come. We must produce at a greatly reduced cost a great deal before we can meet foreign competition at the present level of exchange. We have tried to reduce wages in Bombay lately and you know, Sir, that we cannot do it. The workmen resent; the Government themselves do not favour any reduction of wages. However, to meet this competition, this 12½ per cent. bonus that has been given to foreign manufacturers should go. Are we to suffer simply because the rate has been pushed to 1s. 6d. during the last two years? What is the justification? This adjustment will not take place for years. There will be a great struggle before that adjustment takes place.

4794. On the point of wages, you say that "exchange has been arbitrarily raised 12½ per cent. in the last few years, with no corresponding reduction in wages because any attempt to lower wages meets with the most strenuous opposition," and so on. Now supposing it was said, true for other reasons labour has been able to resist a reduction, because there was a general tendency to a rise in wages in India owing perhaps to a better education, better ability to combine, and so on, nevertheless, if it had not been for the rise in exchange, wages would have been higher than they are, and that the effect of the rise has made itself felt not indeed in a reduction of wages, but in a prevention of a rise. What is your view on that?—I cannot agree that wages would have risen during the last two years during which exchange has been pushed from 1s. 4d. gold point to 1s. 6d. gold point. No such thing would have taken place in Bombay. I do not think wages would have risen even at the Tata's Works at Jamshedpur. Even then we were trying to get the wages reduced. We stopped the bonus of the mill-hands in that period. There was no question of rise in wages. It was not demanded. There was no question about it.

4795. The argument that would, I imagine, be put by one who upheld the contention would be that, but for the rise of exchange, whatever effect that has had upon prices there would have been a demand for higher wages, and you would have seen wages rise to higher levels than they are at present?—There might have been a demand if world prices had risen during the last 2 years; if prices in India had gone up correspondingly there might have been a claim for increasing wages, but there is stabilisation of prices in the world for the last 3 years, practical stabilisation all over Europe and America. So how could that claim have been made for an increase in wages; it would never have been granted and it was never made.

4796. I understand it is your opinion that the rise in exchange has had no effect upon money rates of wages, even a masked effect which is concealed possibly by other factors at work?—I do not quite follow, Sir.

4797. I was really only summarising the replies which you have given to my questions. The contention is that there has been an effect, but it has been masked by other kinds of tendencies. In your opinion there has been no such underlying effect as the result of exchange?—No.

4798. Although we must admit in the hypothetical region the possibility of such an effect?—Yes, Sir, hypothetically you can say that.

4799. Turning over the page, you express the opinion that competition from foreign countries, especially those with depreciated currencies like Japan, France, Belgium, etc., may be met by lowering the exchange to 1s. 4d. Is the benefit that would thereby be gained in your opinion a permanent benefit, or a benefit in competition which would be temporary only, passing with the working out of the readjustments after the change in the rate?—No; it will work immediately and it will work for all time. We cannot stand competition from Japan whose exchange has depreciated nearly 25 to 30 per cent. On the top of that you give them a bounty of 12½ per cent. It makes things impossible, particularly in the cotton industry.

4800. Let me put to you the supposition that the Japanese currency is once more stabilised and has ceased to depreciate, and that the Indian currency also is stabilised and has ceased to depreciate at 1s. 4d., and that this state of affairs has existed for some little period of years. Is the fact that the Indian ratio has been stabilised at 1s. 4d. rather than at 1s. 6d., a fact which will tend to the permanent facilitation of competition between India and these competing countries?—It is a question of adjustment. Only after many years can that adjustment take place. As I have already said to you, for how many years are we to suffer till that adjustment takes place. It will take years, say 10 years.

4801. That is rather another question. I am trying to see how your recommendations work. I rather gather from your last answer that you would look forward to a period at which the benefit of the reduction to 1s. 4d. would have exhausted itself?—After a long period, Sir.

4802. In order to test the length of the period, perhaps one should examine and see what the nature of the adjustment is, should not one?—Yes, Sir.

4803. What happens when we reduce the rate to 1s. 4d. is that the exporter's profits increase because he gets more rupees for his foreign currency, so that he has an immediate increase in his profits?—Yes.

4804. At the same time, as we understand, the importer has to suffer a diminution in his profits because he has to pay more rupees for what he buys abroad?—Yes.

4805. If you take a trade like the cotton trade, to what extent do you think the cost of production in the cotton mills of Bombay depends upon goods actually imported from abroad in the form of subsidiary raw materials, machinery and so on. Is that an important constituent of their cost of production or is it quite negligible?—You can ask that question of Sir Victor Sassoon, who comes here to represent

the Millowners' Association. I am not very closely conversant with these things.

4806. You would not care to give an arithmetical estimate? Nevertheless, we have to recognise that this is a matter to be considered when we are really appreciating the benefits of a 1s. 4d. rate?—Yes, Sir, but I cannot answer those questions so well as he will.

4807. As regards the period of adjustment, we must contemplate that the reaction on prices of imports will be very swift after the reduction of exchange. Obviously that takes place at once, does it not?—You mean the rise in the price of imports? Yes, it must come.

4808. The detriment to the importer in respect of imported goods must go pace by pace with the benefit to the exporter of goods?—Yes, Sir.

4809. So that there is something to be set against the prospective profits there. Now let us consider the other great constituent in the cost of production, that is, wages. By what processes, as regards the currency, could the reduction to 1s. 4d. be achieved in your opinion?—Well, by a reversion of the processes which have been set up in the last 2 years. The Government should start buying sterling at a lower rate of exchange, or should notify that they will receive gold at a rate corresponding to a lower rate of exchange.

4810. Generally I suppose the processes that have taken place by which the rate has been increased could, in your opinion, be summarised by describing them as various forms of restriction of the currency? —Yes.

4811. So that a reversal of that process could be described as various forms of increasing currency?—Yes, in proportion to the country's trade as the country wants it.

4812. Do you accept, in such a practical matter as this, the general theory, which is usually called the quantity theory of money, that when you increase the amount of your currency in some such way as this the inevitable result is a general rise in internal prices?—All other things being equal that theory must prevail, Sir.

4813. I do not know if it is the same in India as it is elsewhere, but elsewhere one would expect a general rise in internal prices, in its effect upon the cost of living of the industrial classes, to result in demands for increased wages?—I do not think on a reversion to 1s. 4d. any such demand is going to be made, as I have already said, Sir. The wage-earning classes do not expect any further rise in their wages; they fear a reduction.

4814. How should we stand if we recognise that the result is a rise in the cost of living? If the wage-earning classes do not get any increase in their wages, then the increased profit of the cotton manufacturers would really be at the expense of the wage-earners, would it not?—But will there be increased profits? Just now they are making losses, losses on stock. Are they to make losses for the benefit of the country and for the benefit of the wage-earners? Are they not entitled to have a fair profit; for the last 3 years they have been making losses. If you go back to 1s. 4d. it will put them on just a competitive basis with other countries, just enough to meet their financial charges and to pay perhaps a dividend to their shareholders.

4815. I quite agree with your point that one ought not to express it as profits; it is really an improvement in the position of the exporters. My question ought more accurately to be put in this form. If there is anything in the supposition that we have been trying to follow out, does it not seem as if the improvement in the position of the exporters which you recommend in order to enable them to compete more successfully with other countries might be at the expense of the wage-earners of the country?—But it is just now the reverse; it is the wage-earners who are benefitting by the position; the position will be then equalised. The wage-earner is now getting his wage at the expense of the whole country.

4816. Would you say in that connection that the wage-earner could afford to make that contribution, as it were, towards the success of industry?—Yes, Sir.

4817. Now further on in this paragraph you say: "For as gold prices fall the price which India will realise for her produce will be less and the trade balance in her favour will get less. As prices fall all over the world imports into India will increase and competition of foreign imports will grow and India can only face this if her exchange is also lowered. It will be therefore to India's advantage to revert to the 1s. 4d. ratio." I think I can put the difficulty which I feel about that contention in the form of this question. If the anticipation of a general gradual fall in gold prices of commodities is realised (the emphasis there being on the words "general" and "gradual," which I understand is what you are anticipating), why should this result in the trade balance of India in particular becoming less?—She will get less for her produce. If there is a general fall in the prices of the various commodities she exports, she will realise less. Even this very year the price of cotton realised in rupees will be much less owing to the fall in the price of cotton that has taken place. It may amount to 12 or 13 crores of rupees; but that is owing to agricultural conditions. If you extend that to all commodities as the result of a general fall in prices, the sum realised must be less; therefore the balance of trade must get less.

4818. She will get less for what she sells?—Yes.

4819. But will she not also pay less for what she buys?—She will pay more at 1s. 4d. and not less.

4820. Let me put the difficulty in another way. Does not your argument here assume that they are changing everywhere else except in India?—Yes, I assume the change all over the world, a general fall in gold prices must lead to a reduction of the balance of trade. The amount realised for exports and the amount paid for imports will leave a lesser balance of trade measured in rupees; therefore you cannot have such a big balance of trade, and therefore you cannot maintain the 1s. 4d. ratio. That is my point.

4821. In spite of that we are assuming that the change of prices in India proceeds *pari passu* with the change of prices elsewhere?—Well, it must come *pari passu* once the exchange gets settled at 1s. 4d. world prices must tell on India prices. We won't have a different range of prices in India from world prices. That would be impossible.

4822. In order to test the matter, supposing, by some strange visitation of Providence, the prices of everything all over the world were to be doubled tomorrow morning, would that have any effect on India's balance of trade?—Well, Sir, that is not a supposition; that very thing happened in war time. Prices not only doubled, but trebled and quadrupled.

4823. There would be great dislocations, would not there, in one place or another?—Yes, but that happened in war time. We could not hold exchange at 1s. 4d. We had to let it go and find such level as it could. But I am not talking of such times, I am talking of normal times.

4824. I do not think war experience assists us very much, because a feature of the war period was the considerable dislocation of relative prices as between one market and another. However, let me pass from that to the next question. In the next paragraph you deal with some aspects of the import of gold. You say: "The surplus savings of the country are being diverted more and more into gold and people prefer to buy gold rather than cloth and other necessities of life." Do you see, in the available figures, any evidence of the demand of the country for gold having been at all satisfied for the present? —Sir, I have said in my little statement that India can never be saturated with gold. We can never go on that assumption because in the first place the customs and habits and the religion of the great majority of the people enjoins that gold should be used on certain occasions as presents, and therefore India will always be a buyer of gold so far as that

goes. But the point I have made in this second paragraph on the second page is that if you lower the price of gold from Rs. 24 to Rs. 21-3, well naturally people will buy gold in preference to anything else, accustomed as they are to buying gold, accustomed as they have been to buying gold for a high price, to be suddenly given gold at Rs. 21-3. They must buy, they did buy and they will continue to buy. I do not expect any such saturation. India has never been saturated with gold. As a bullion broker for the last 34 years I can say that never has India been saturated with gold. She only stops buying gold when her production falls off through famine or other causes.

4825. And she begins to buy as soon as times improve?—Yes.

4826. From your wide practical experience of this particular aspect of the situation, could you give us any enlightenment as to where this gold goes?—I am in Bombay always; I seldom go up-country.

4827. I do not mean geographically; what is it used for?—In the first place every Hindu (and the Hindus are two-thirds of the population of India) must, when he marries, give what is called Stri Dhan, that is, a gift of gold to his wife; Sir Purshotamdas Thakurdas could confirm that; and that custom cannot go; it is enjoined by their religion; then they have certain years for the marriage season, that is, a propitious time for marriages; and in those years the demand is abnormal. Then there are years which are not propitious and the demand falls off; but there is a big average demand for these purposes.

4828. Therefore in good times, as the family's position improves the dowry to the daughter about to marry is increased and this increase is in the form of gold ornaments?—I should think so; I am not a Hindu, but if you ask any Hindu gentleman he will probably confirm this statement. It is in proportion to their means; the very well to do classes do not confine themselves to gold; they go for jewels, diamonds, pearls and such gold; but gold they must give; that is written in their Shastras, gold and silver.

4829. If I ask you any questions about this and I go astray owing to our relative ignorance about the habits of the Hindu household, fortunately we have members of this Commission who can put me right in supplementary questions. It seems to me interesting to bring out this point. If that is so, one must look upon this as an inexhaustible sponge for sucking up gold, because the wealthier the country the wealthier the well-to-do Hindu family becomes. There is really no limit to the amount which could be used for ornaments of gold when a Hindu marries his daughter?—I would not say that; supposing a Hindu is worth five lakhs and the dowry is Rs. 10,000, he does not give such a disproportionately large quantity of gold; a certain quantity is in gold and the rest in jewels. I do not think there is any fear of India sponging up all the world's gold.

4830. It is these considerations you had in mind when you said that India can never be saturated with gold?—That is one consideration; but the main consideration is this: people say that the price is lowered and 73 crores have come in and therefore the country must be saturated; I do not believe in that theory.

4831. Will the apparent cheapness of gold in comparison with other commodities, such as cotton, cloth and so on, be in your opinion a permanent feature, supposing the rate of 18d. were to be maintained, or would it work itself out as prices adjust themselves to the 18d. rate?—It will take many years to work itself out.

4832. You would expect for many years the people of India to look upon gold as still cheap in relation to commodities?—Yes.

4833. Continuing, I understand that you contemplate a reduction to 1s. 4d. and that you would put a burden upon the budget, whether it is temporary or otherwise, which would amount to something in the nature of three crores?—Yes.

4834. I understand you would say, in the first place, that that should be covered by economies?—Yes.

4835. But I also understand that, if it could not be covered by economies, you would not shrink from recommending that the additional burden should be covered by additional taxation?—I would prefer additional taxation to screwing money out of the people by raising exchange and I have given the reason why. That is much preferable to getting that three crores by raising exchange as has been done in the last three years.

4836. I quite follow that; but, making a further comparison, as against retaining the present rate and thus incurring no additional burden in the budget I understand you would prefer that the rate should be lowered, and you would not hesitate to say that, if it were necessary, the gap should be covered by additional taxation?—I would prefer that.

4837. Increasing the burden of taxation has peculiar difficulties, has it not, in India now?—Direct taxation, of course, the people will resent; but if they saw the point which I have made here, that the indirect taxation is a great deal more than the three crores which the Government gather into their treasury, they would say that they would rather pay the direct taxation than this indirect taxation.

4838. Turning back to the position of the wage-earner which we have already considered, we rather arrived at the position that the wage earner's wages were not rising. If they resulted in a fall and he also found that he might have to pay additional taxation in order to balance the budget, it would not seem to be an attractive proposition to the wage-earner?—This is a question of three crores of rupees divided among 32 crores of people; what does it come to per head: further it need not be on the wage-earner; it can be equally distributed among the various classes, the wealthier and the poorer classes; there are ways of doing it.

4839. In the last sentence of paragraph 6 you say: "A budget which balances itself by raising exchange is unsound financially and economically." Might not some critic use that phrase against your argument by saying that a budget which is unbalanced by reducing exchange is no more sound economically or financially than the reverse procedure?—The Government started it by raising exchange; if you put the question to me that exchange was 1s. 4d. at this time as it was for many years and I were to say "reduce it to 1s. 2d.," then you could direct that remark against me; but not now, for the reasons I have given.

4840. In the following paragraph we come to an argument which possibly you can elucidate for us. You say that the natural rate of exchange is the rate at which the silver content of the rupee is exchanged for gold. I find some little difficulty in understanding the precise connotation of the word "natural"; and in order to clear my mind let me ask, in the first place, whether you would be in substantial agreement with an opinion which has been very often expressed to the Commission that the true way in which to look at the silver rupee is to look upon it as if it were a note printed on silver. Is there substantial truth in that?—I think so.

4841. If the silver rupee is a note printed on silver, one would feel tempted to test your contention here by asking, is the natural rate of exchange in respect of a paper note the rate at which the paper contents of that note could be exchanged for gold?—But what does that paper note represent? If you want to sell that piece of paper as a piece of paper it has no value, whereas the rupee, though you may call it a note printed on silver, when you want to sell it, can always be sold for its bullion value; the analogy does not hold; one is quite different from the other.

4842. I apprehend your reply, that there is this difference between the paper note and the rupee note, that the intrinsic contents of the one are greater than the other; but I am looking at it from the point of view of exchange and not from the point of view of intrinsic value at all. Does the word "natural" there get us any farther if we recognise that, in the

same way, the natural value of the paper note is a preposterously small value unless you take it as a token? Are we not there, when we are considering exchange values, devoting attention to a circumstance which is totally irrelevant?—I cannot answer it, Sir, straight; but I will answer it in this way: what was the rate of exchange in 1893 when they closed the mint? The value of the silver contents of the rupee expressed in gold was the rate of exchange; that was the natural rate of exchange for a century or even more. What did we do then? We said "We do not want it. This rupee fluctuates too much; we will therefore give it a price, not a natural price, but an unnatural price." And we fixed it at the unnatural rate of 1s. 4d. after great hesitation. Some of the members of the Herschell Committee were opposed to 1s. 4d.; they said it was unnatural, it was too high; but it was fixed at 1s. 4d. Was that a natural rate of exchange? That is my point. That was an unnatural rate of exchange at 1s. 4d. We have in the last two years shoved it up from 1s. 4d. to 1s. 6d.; and in last year's budget it has been described as the natural rate of exchange; how is it the natural rate of exchange? I say it is more unnatural than ever. 1s. 4d. is unnatural; 1s. 6d. is more unnatural; 2s. is most unnatural and is an absurdity. I am quite right in saying that this is not a natural rate of exchange; it is an artificial rate of exchange which we have created by making a scarcity of rupees. That is my point, Sir.

4843. I quite appreciate that it is necessary to draw a distinction between a natural and an artificial rate. My question is merely an attempt to ascertain whether the test for a natural rate which you suggest is a sound one, and I tried to express it by an analogy. I will put the question in this way. If it is desirable to fix, as I understand you to contend, the exchange value of the silver note as near as possible to its natural value, the value of the contents of silver, would it not also follow that it would be desirable to try and fix the value of the paper note as near as possible to the trifling value of its own paper content? —That is a question I cannot answer, Sir. I have already answered it indirectly.

4844. That was rather dwelling on the last sentence in the paragraph that "even the 1s. 4d. ratio is not the natural rate, but is nearest to the natural rate, and should be forthwith restored." In the middle of that paragraph you say: "After years of industrial and economic trouble this unnatural rate of 1s. 4d. became effective, and prices and wages and other conditions settled down to the new ratio." What would your opinion be, supposing the contention were to be put to you, that, in the same way, after a period of industrial and economic trouble the rate of 1s. 6d. had become effective and prices and wages and other conditions had settled down at the rate of 1s. 6d.?—I have already answered that, Sir. It will take years. We will have to suffer. Why should we? What have we done to deserve that suffering simply because the Government want three crores more in their budget? I have already said we are willing to pay as a nation. The nation would rather pay their three crores than have this industrial and other depression in the country. That is indirect suffering. That is indirect taxation.

4845. The basis of your reply, if I do not misunderstand it, is that prices, wages and other conditions have not settled down at the new ratio?—They have not, Sir.

4846. Are there any statistics by which one can enlighten oneself upon that question as to whether prices and wages have settled down at the new ratio? It should be a matter susceptible of statistical examination, I imagine?—Yes, Sir, the figures can be produced and studied.

4847. Which figures would you refer to for the purpose of illuminating one's judgment as to whether conditions had settled down at the 18 penny ratio or not?—You mean wages had settled down to the 18 penny ratio?

4848. Whether substantially conditions had adjusted themselves to the new ratio, or whether, on the other hand, as you express the opinion, there are still maladjustments?—If you study all the statistics of prices, the cost of living, you can arrive at that? But that is not the only consideration. The main consideration is can industries in this country stand up against that ratio? That is the main question. Can there be an adjustment of our industries to meet foreign competition at that ratio? I can say that there is no such adjustment now.

4849. As regards prices, I believe we have ascertained that the chief, if not the only, statistics available are the index numbers usually referred to as the Calcutta Index Numbers?—Yes.

4850. In your opinion, do the recent movements in those numbers show any substantial lack of adjustment between Indian prices at the present rate of exchange in comparison with the general level of prices as disclosed by the Index Numbers of the other principal gold-using countries?—Well, I have got a memorandum, Sir, from the Secretaries which gives these figures. The exchange was 1s. $4\frac{1}{32}$d. in September, 1923.

4851. May I ask what those figures are that you are quoting now?—This is the historical memorandum which has been prepared for the Commission of which I have been given a copy, Appendix VII.

4852. Appendix VII of the Historical Memorandum. I will just turn that up, if I may, so that I may follow you?—If you come to September, 1923, the exchange rate is 1s. $4\frac{1}{32}$d. I take that figure because it is near 1s. 4d. The English index number is 160, the American 154, and the Indian 174. Then I would go straight down to July, 1925, on the next page, Sir. There Great Britain is 165, that is 5 higher, United States 159, 5 higher, and Indian 160, that is 14 lower, compared to the parity 160. And at that time exchange was 1s. 6d. It had just touched 1s. 6d.

4853. The figures of which most use has been made in discussion before the Commission are the comparative figures of the General Index Number of Calcutta, in the first place, the United Kingdom Statist Index Number in the second place, and the United States of America Labour Bureau Index Number. Taking the figures as in August, 1925, we find that, in comparison with the base, Calcutta is 157, the United Kingdom Statist is 158, and the United States Labour Bureau is 160?—Sir, here it is shown as 165 for Great Britain in August.

4854. I think that is the difference between the *Economist* and the *Statist*. With all reservation as to the amount of reliance which can be placed on such an index number, especially in view of the rather summary methods introduced into the Calcutta index number, for what they are worth these three figures, 157 Calcutta, 158 United Kingdom, and 160 United States of America, would seem to show, within the necessary limits of error, a substantial equalisation of prices under present conditions, would they not? The variation between the two British index numbers quoted of 158 and 165 is probably due to a difference in methods of calculation?—Yes, Sir.

4855. As to the cost of living indices, I think you have some figures available. Have you been able to consider those?—I have not got them here, Sir.

4856. We must draw our own conclusions from them. I need not burden you with them if you have not had an opportunity of considering them?—But may I make a statement, Sir?

4857. If you please?—You see I have taken these figures of September, 1923, and I have then compared them with those of August, 1925. The movement to raise exchange commenced about this period, September, 1923.

4857A. On what grounds did that movement take place?—The Government justified it by saying that they had to raise the exchange in order to stabilise prices in India. And in the last budget they said that they had done it. Well, then, my point is they took credit for which there is no justification. Prices had already stabilised in Europe

and in America and India in 1922-23. Where was the necessity of raising exchange in order to stabilise prices in India? Where was the justification? I say it was deliberately done in order not to stabilise prices but in order to raise exchange for various reasons. And I say that there was no justification for that movement, looking at these index numbers. It was a deliberate attempt to raise exchange and therefore in my humble opinion a deliberate wrong has been done to this country, particularly to its industries and to its agriculture. It has been repeatedly stated by high Government officials that it was in the interests of the country they were stabilising prices. Where is the justification on these figures, Sir? Here is this historical memorandum and in paragraph 18 and the previous paragraph they don't conceal the fact that they deliberately raised the exchange. They say they contracted currency. Why did they do it? Where was the justification for it? I don't think that they can sustain that contention of theirs that they raised exchange in order to stabilise prices in India. There is nothing in the figures here to show it and it is a Government memorandum. Therefore on that point I say that a wrong has been done to this country in raising exchange on that plea. Therefore exchange should be put back to 1s. 4d. for that reason, if for no other reason. It was wrongly raised to 1s. 6d. on a wrong plea.

4858. Would it be an unquestionable proposition that, in September, 1923, Indian prices, as revealed by the index number, were substantially stable? I observe that in the course of that year they varied between 170 and 180?—Yes, they did. But practical stability was reached in 1922. It started getting to practical stability then and since then it is thereabouts.

4859. Further, we observe that, during the period to September, 1923, there was a very substantial discrepancy between Indian prices and world prices as revealed by the United States and Great Britain index numbers?—Yes, there was—174, 160, 153. So I wish to emphasize this point which I have put before you now, that exchange has been raised on the plea of stabilising prices. That action on the part of Government cannot be justified on these figures. Therefore it should be put back.

4860. You recognise that, when you make the final conclusion in your argument, that does raise the question as to whether conditions have or have not, in your opinion, adjusted themselves to the new rate, and that there would be disturbances involved in any further alteration of the rate?—Sir, in my opinion it would be a great advantage even to have little disturbances and go back to 1s. 4d.

4861. Continuing your next paragraph in development of your argument, paragraph 8, I understand in this paragraph you express a doubt as to whether the present favourable balance of trade is likely to be maintained?—I have very great doubts about it, Sir.

4862. In your opinion is it possible for the foreign trade of any country to show anything but a balance as between exports and imports, visible and invisible, for more than a very brief period?—To show a balance in favour, Sir?

4863. To show anything but a balance as between exports and imports, visible and invisible, for more than a very brief period?—It must show a balance one way or the other, if you are reckoning visible exports and imports; if you take invisible and everything, then it must come to an adjustment somewhere.

4864. Except for very brief periods of dislocation, and particularly in a bad year, or when the country is running into debt or conversely?—Yes.

4865. If that be so, if it is impossible that there should be a substantial balance, could you explain why it is easier to maintain a ratio of exchange at a stable high level rather than at a stable low level?—In India we have got enormous foreign liabilities. The higher the rate of exchange, the greater the strain on the country to meet that liability. We have got to consider that. I think that India has to remit nearly a hundred crores of money every year to meet foreign charges of various kinds, Government and private. Well the higher the ratio you put, the greater the strain on the country to meet it. You must export more in commodities to meet the foreign obligation.

4866. You consider that is a permanent factor which continues to operate, even after all adjustments of prices and so forth have taken place which result from any change in the ratio?—Well, the permanent factor is the Rs.100 crores to remit; you cannot get over that. You must meet it every year, and then it must depend on world prices whether you can meet it or not, and in my opinion if you fix it at 1s. 6d. it is too high to meet; it must create a strain. The year that you cannot remit, you must then devise methods to remit that money by contracting the currency and by other measures, and the effect of such action is disastrous on trade and industries. Why should such a risk be taken—a high rate of exchange being fixed, and then trying and maintaining it at all costs at the cost of the people? Where is the necessity of fixing it so high? During the experience of nearly 25 to 30 years the 1s. 4d. rate was nicely maintained; why should we not revert to it?

4867. Finally, with regard to the internal aspects of a change in the ratio, half way down page 3 you express the opinion that "any change of the ratio from 1s. 4d. must upset the relations between debtors and creditors." What would your opinion be upon a contention which has been advanced that, as a matter of fact, all such relations have been so much upset by the period of extremely fluctuating ratios through which India has passed that the minor difference between the present rate, say 1s. 6d. and your suggested 1s. 4d. would really be negligible in comparison with those upsets which have already taken place?—Sir, those upsets were in abnormal times. Prices were all upside down. India was getting enormous sums of money for her produce owing to inflated prices on the other side, the destruction of commodities on the other side. Such things are not noticeable in disturbed times, but they become very visible in times like these when things are settling down. Then people begin to feel it. You may not feel a thing in years of great prosperity or years of great economic excitement, but when it all cools down, then the effects are more felt, even slight variations would be felt. We were able, for instance, to face any foreign competition when exchange was two shillings. Our industries were thriving. Now with exchange at 1s. 6d. we cannot face it, because the times are settling down, competition is growing. There was no competition then.

4868. I am not sure that I quite follow that. Of course in times of great excitement, distractions are provided to distract attention from mere monetary losses, but nevertheless a sharp rise of exchange to over two shillings and so on will have affected an actual financial disturbance of the relations between debtor and creditor, whatever distractions there were at the time to call attention away from that circumstance, will they not?—I did not quite catch your point.

4869. I did not quite follow why the factor of a disturbance of the ratio, such as that to which you refer during the war period, should be of less importance only because the times are abnormal?—It is because we do not feel it, because the prices are so inflated that we do not feel it.

4870. Why should one feel such a circumstance more at one time than at another?—When things have settled down, you will feel such things more. When a man is flourishing, when a nation is flourishing from various extraneous causes, we may not feel such effects; when the realities come, the sufferings begin.

4871. You say they have more time to think about their troubles. Nevertheless their troubles have an anodyne in the form of excitement?—We do not feel it in those circumstances.

4872. However, that is entering a field of psychology too remote for this Commission. As regards the question of the disturbance of the relations on contracts, let me put to you, in order to elicit your opinion, another contention which has been advanced. As I understand the case for the equity for the 1s. 4d. ratio, it is that a disturbance of that ratio disturbs the basis of all contracts in India when that ratio was in force. The contention to which I refer is that that ratio has been in force for some time. It is, therefore, only the long-term contracts which have got to be considered in that connection. On the other hand, you must see that a departure from the 18d. ratio would disturb the relations between debtor and creditor in respect of all short-term contracts in India during the prevalence of the current ratio. What, in your opinion, is the relative importance of these two interests, the interests based upon long-term contracts and those based on short-term contracts. Is there any means of evaluating the relative importance to be attached to the two categories of interest?—It would be more felt in the case of long-term contracts than in the case of short-term contracts. That is all I can say, but it would be felt. The one would be felt over a longer period.

4873. Would you find it possible to take the further step of making any estimate as to the relative importance of the two categories, the long-term and the short-term interests?—I am afraid I am not able to help you in that matter.

4874. In paragraph 13, you say that "If exchange had been allowed to recede to 1s. 4d. gold point, and Government had shown its willingness to maintain it there, a free flow of money into and out of India would have immediately commenced, the money rates in India would have fallen and tended to approximate to the Bank of England rate, the nervousness in the money market so noticeable in 1922 to 1925 would have disappeared, a great demand for Government rupee securities would have sprung up, the Government rate of interest on their loans would have immediately fallen, and the yearly interest charge would have been considerably reduced." Further on, in the next paragraph, in the same connection you say that "not only has the rate of borrowing for Government loans been high in the last few years, but the Indian Corporations have also had to pay high rates for their borrowings in India and the flowing of money into Government and Corporation loans at high rates has made it exceedingly difficult for industrial concerns to raise money either by way of debentures or preference shares, and has been a serious check to industrial expansion, particularly in Western India." I want to put against that what might be the contention of a critic. Might not a critic say that all these desirable consequences to which you refer as regards the easing of money, the facilities for the issue of debentures, the reduction of interest rates and so on are advantages which can always be gained by any measure of inflation; and might he not put against you that what you are really advocating there was the advantages which members of the school which advocate inflation desire to obtain, but which the experience of other countries, which have actually seen inflation, has taught them to be very temporary advantages which carry with them very dangerous consequences which more than counterbalance the temporary advantages obtained? Would there be anything which you think would be worthy of a reply in such a criticism?—I can answer that, Sir. When you talk of inflation, what kind of inflation is referred to? In the other countries referred to the inflation is abnormal inflation, an increase in the note issue by various Governments, as is now going on in France. If you refer to that, I agree with you; but when I say that by having a fixed rate of exchange, you get money into the country in the natural course of trade, that is not inflation. If India gets more money for her produce, the money comes in the natural course and that cannot be called inflation. I do not want inflation. I do not suggest inflation by going to 1s. 4d. Besides, as I have said in one of these paragraphs, the inflation will check itself. Automatically there will be deflation if there is inflation.

4875. You would not advocate inflation in any form? —No, I do not.

4876. The characteristic of inflation, is it not, is that the purchasing medium is increased in proportion to the goods and services which that money has to purchase?—Yes.

4877. And when that takes place, then there are these consequences to which you refer here, that is a fall in the rate of interest, a greater ease in the money market, and so on. But, as you say, there is no inflation. If the purchasing medium is continually to be increased in proportion to the increase in the turn over of the goods and services, how would it be that there will be a beneficial experience in the easing of the rates of interest and the general facilitation of new issues and greater ease in the money market?—This way, that if you fix exchange, all the exchange banks here are to make money with a fixed rate of exchange; if they find that there are securities in the market yielding good rate of interest they will immediately draw upon their London office, put the money in the market, buy the securities and the value of the securities will rise and the rate of interest would fall. That is another consideration apart from the natural increase in currency that may follow in trade movements. I have seen such things in pre-war days, exchange banks taking advantage of every such difference in rates in securities between England and India. It used to be a regular business. How can banks do that when exchange is uncertain and fluctuating? Money rates are forced up and they cannot bring money. They do not know what will follow, and the natural consequence was that the money rate was raised. Government continue to pay high rates and industries cannot get any money at all. You cannot float any debenture except at 8 or 8½ per cent. You cannot float a preference share in Bombay unless it is 8 to 9 por cent. and then you must pay enormous commissions to get it.

4878. But must not we look at it from the view of this fundamental consideration, that in order to get, in this connection, lower rates of interest, in other words cheaper money, you must make money cheaper, and, in order to make money cheaper, you must increase the proportion of money to things to be bought with money. If you do that you are doing what is ordinarily called inflation, and unless you do that, unless you increase the proportion of the purchasing medium in relation to the things to be purchased, there is no reason to expect that you will have cheaper money rates. That is an ordinary little bit of economic analysis, is it not?—There is a connection between the London money market and the Indian market, which connection you have dislocated by recent exchange policy of the Government of India. When that connection is established, rates of interest in India must approximate to rates of interest in London. What I mean is, you must get closer to the London rates and the money will flow not only into Government loans but into industrial concerns also. Foreign money will come in, and if there is an inflation as a consequence of that, as I have said in one of the paragraphs, it will automatically check itself. We used to check inflation in pre-war days automatically. There are checks to inflation under an automatic system of currency. It is not that Government only can inflate and deflate whenever they like at their own sweet will. There are other automatic ways of inflation and deflation which were in force for many years and worked satisfactorily. The effect of Government policy has been to create a money market in India separate from all the other money markets of the world, to starve the market of money supplies so that exchange may go up. We know what the consequences are. They themselves have paid high rates of interest all these years. Those rates would have been lowered long ago. What is the cost to the country of that? They have 3 crores in the budget, but what is

the cost of those policies? Increased rates of interest and high rates of conversion that they had to pay. That is my point.

4879. Under question 3, paragraph 15, you say, "If it is decided to revert to 1s. 4d. ratio, I am of opinion that the transition should be achieved step by step." Let me put to you again another contention. What would you say to the contention that, supposing it is decided to revert to the 1s. 4d. ratio and that policy is announced, it will be impossible to maintain any intermediate stage; that the fall would immediately be anticipated by dealers in the exchange market; that it would be sharp and sudden to 1s. 4d. and that it might go even below 1s. 4d. followed by serious fluctuations of a somewhat violent nature, which will have a very disturbing effect on trade?—You mean to say, Sir, that exchange will fall suddenly to 1s. 4d.?

4880. Yes?—I am afraid I must agree with you. It will have that effect. If you once say that your policy is to be 1s. 4d., then it will go down precipitately. It will be difficult to check unless at that time there is a very big balance of trade in favour of India and if it is done at an inopportune moment it may go straight down to 1s. 4d.

4881. If that be so, will you tell us from your practical knowledge of these things whether, under the circumstances, it would be possible for importers to keep their exchange covered?—Yes, Sir, I have said so here. To-day in Bombay you can buy exchange 12 months forward. Day before yesterday business was done for T. T. on London at 1s. 6⅜d. for December, 1926, whereas the ready rate is 1s. 6 7/16d., only a 16th difference. Why should an importer when he wants to import a year ahead, why should he not cover and why should he run a risk? And if he runs a risk Government cannot be responsible for that, when he has every facility to cover his exchange. If exchange is lower forward that point may arise. But exchange is the same for 12 months to come.

4882. I do not know, but supposing it is once known that exchange is going to fall to 1s. 4d., can the importer deal in this way and cover his forward exchange?—An importer to-day wishes to buy so much longcloth from Manchester. He sells it to his dealer here and the next moment he can fix the exchange. He need not wait. If any importer speculates in exchange and keeps it open that is his folly. He cannot tell the Government then "you put me in trouble." It is his own folly and not the Government's action.

4883. Then we come to your recommendations as to the basis of a currency system. You are in favour of a definite move towards the establishment of a gold standard, by which we understand is implied in some form a gold currency?—Yes.

4884. You recommend the stopping of the rupee coinage, which is, I think, the only remedial measure which you would take in order to establish the gold standard; and you say in the next paragraph "as regards the gold standard reserve, it will not be added to if there is no further coinage of rupees, and the interest on the same should we carried to revenue as now. When the gold standard is fully established the reserve can be used for some purpose beneficial to India, *e.g.*, reducing her sterling loans." Does that apply to the whole gold standard reserve, 40 millions' worth of it?—What will be the use of it when once the standard is established? If you get sufficient reserves of gold in the currency, why should the gold standard reserve be kept? When your currency is gold and rupee is a subsidiary and is a real token coin, there is no necessity for the reserve.

4885. Your reserve has got to fulfil the purpose, has it not, of protecting the exchange value on the whole of your internal currency?—Yes.

4886. Would you then have the internal currency consisting of notes and gold only or gold and rupees? —Notes and gold, and rupees only as a subsidiary, as a token coin with a very limited legal tender.

4887. And in your paper currency you would have enough gold to cover the outstanding notes?—Once it is properly established, it will be so.

4888. As regards the rest of the currency, you would rely wholely upon the gold which will return from circulation, or the contractibility of the gold circulation in order to adjust the balance of international payments?—Yes, and on the gold in the currency reserves.

4889. That suggests the question, what reliance do you think can be placed upon gold in circulation to fulfil the purposes of a reserve for international payments in case of a bad year and a temporary turn in the exchange? Is it prudent to rely solely upon the return of gold from circulation?—You see the position is that supposing there is a gold standard established, and, say, about 100 crores worth of gold is in circulation and a bad year comes, people must part with that gold to buy things from foreign countries. That gold must go to the banks in payments for imported produce. It will then go into currency reserve again and be exported. Such things have been known in the past. I have known in famine years gold dealers besieging banks day after day with huge amounts of gold for sale and gold was exported to sustain exchange, otherwise the exchange could not have been sustained in those years. There are statistics to show the exports of gold from India. In a year of scarcity gold does come out. In a year of very high prices also for gold, gold is exported. In the period after the War when gold went very high large quantities were again exported. I do think once the gold standard is fully operative that gold will come back, must come back into the banks and flow from the banks into the currency office and be available for export. There is past experience for this.

4890. The steps you are contemplating are, first of all, the initial stages when gold coin should be given freely—that is, against rupees or notes?—For notes, I mean, Sir; and also if they give gold coin or gold, that is merely an exchange. What I really mean here is in exchange for notes.

4891. But not for silver rupees?—No.

4892. You would make the note encashable in gold, but you would not undertake any obligation?—After the establishment of the gold standard, after proper reserves have been amassed, then only this step can be taken. I have said so explicitly, that the Government should not undertake the liability to pay gold till a sufficient quantity of gold is accumulated.

4893. That is in the last paragraph—"The obligation to pay gold is not to be legally undertaken until vast amounts of gold are accumulated in the reserves, &c."?—Yes; Government must make the people know as much as they can that gold is to be the currency and that Government will give them gold, keeping the power not to give gold until such time as the standard is fully established.

4894. What will be the process of the accumulation of gold in the currency reserve; how will it come there?—If there is a favourable balance of trade India will take gold; there will be an automatic inflow of gold on a favourable balance of trade. That will be the main source of the reserves. There are enormous quantities of gold in the country. As people get familiar they will not see the sense of keeping gold locked up; as their financial education progresses gold will not be hoarded any more.

4895. The imported gold will come in exchange for notes?—Yes.

4896. So there will be a steady accumulation of gold in the reserves, and that would result, would it not, in a steady rise in the proportion of the reserve to the outstanding note issue?—It would.

4897. You refer to a vast amount of gold; it might attain a high percentage?—It must be in proportion to the trade of the country. If you deprive it of silver currency you must supply a proportionate amount of gold currency, or notes backed by gold.

4898. What is your view as regards the expense of this process when you have this accumulation of a vast amount of gold in the reserves?—I must refer to this memorandum, a copy of which has been sent to me about the Gold Standard; I received that from the joint secretary. It will no doubt cost something, but the country must stand the cost. We must pay

for our follies of the past. We have bought enormous quantities of silver, paying very high rates owing to stress of circumstances. We have to convert them into gold and pay the price and the penalty for our mismanagement in the past. But the country's general view is that it wants the gold standard and it must pay for it.

4899. Have you been able to form any estimate as to what the ultimate cost of these measures for the introduction of a gold currency would be?—That I cannot say, Sir; I have not given so much time to this question. I received the Government Memorandum only lately during the last two or three days; but it will certainly be a costly process. But the country, so far as I can see, is prepared to pay the cost and get an effective gold standard, and I think the cost of a gold standard eventually will be less than the cost that we have been made to pay over the gold exchange standard through the manipulations and the mismanagement of that standard. We have made enormous losses on that. We have borne it; well, let us bear this also and go on to a proper standard and a much better standard. For instance, during war-time we bought 250 million ounces of silver from America at a hundred cents to 102 cents an ounce, which is an enormous price to pay. We had to do it; but we are losing on it to-day. In fact this memorandum suggests it should be sold off at 24d. if nothing more can be realised. I do not agree with that. It depends on how it is sold. There are opportunities for selling silver. If the world markets require silver there may be opportunities for selling our silver, realising a better average price than the 24d. which this memorandum suggests. It takes rather an exaggerated view of the cost of establishing the gold standard.

4900. With regard to the proposal to which you refer on the question of silver, the proposal is to sell off an amount of silver equal to about three times the world's total present annual production in the course of 10 years. What, in your opinion, would be the effect of that upon the silver market?—That is a difficult question to answer, Sir. Circumstances in future may be such as to absorb that silver, and circumstances may be such that it may be quite impossible to sell that silver; the world may not absorb it. It depends on conditions in India and China. India itself will absorb 12 crores of silver per annum. Government might prohibit the importation of silver into India for a few years and sell off this silver in the country. That is possible, at a fixed rate. But the people will buy a certain quantity of silver, as I said, because their religious customs and other things prescribe it. Fix a reasonable rate and sell it in the country itself.

4901. Are there any foreseeable circumstances which might operate to increase the world's demand for silver in the course of the next 10 years, or, on the other hand, to reduce that amount?—Well, Sir, there are various ways of looking at it. I think the currency demand of India is already less. Whether you go to this gold standard or not, India is not absorbing so many coined rupees as she used to; she is using more and more notes. So India I think is a lesser factor in the years to come as a buyer of silver than she has been in the past. As regards China I cannot say, Sir. Vast developments may take place there; she may buy more; that is a possibility.

4902. Or she might go from bad to worse?—She might do anything; I have no experience on that point, but I should think the Indian demand would be less. There are other undeveloped parts of the world, however, like Africa which may want silver currency, owing to the big population and poor population.

4903. There is one aspect of peculiar interest that I should like to ask you about from your wide experience of the bullion market. Making the assumption made in these memoranda, that from first to last the introduction in India of the full gold standard would require an addition to the imports of gold into India of an amount of gold of the order of about 100 million sterling, what, in your opinion, would be the effect of that upon gold prices in general, and what would be the reaction of that effect upon the social and economic conditions of India?—Well, Sir, we have been always frightened that India will buy such an enormous amount of gold as to upset the world; that is one of the bogies we have been confronted with.

4904. Let me make one little explanation of my question. I am asking the question not at all from the point of view of its effect upon any other country, but simply and solely what would be the reactions upon social and economic conditions in India itself? —As the result of the establishment of a gold standard?

4905. I am asking you to make the assumption that a hundred million sterling additional supply of gold would be required?—The effect of those 100 millions being withdrawn from the world?

4906. Yes, on Indian prices and social and economic conditions in consequence?—This memorandum says it will take 10 years, that is, at 10 millions a year. Well that would produce no effect on the world. If anything the world should welcome it. There is too much gold in the world; too much going to America; why should some of it not come to India; how is it going to do any harm? The establishment of a gold standard in the next 10 years can do nothing but good to India and the world by absorbing the surplus production which the world is not able to absorb. In that way India will act as a reservoir and as a balancer of the gold supply.

4907. Is it the common opinion that the world's supply of gold in the foreseeable future is going to keep pace with the world's demand for gold?—In the near future it looks like that. It looks as if the world's demand will be more than met by the world's supply of gold; in the near future—I cannot say how long.

4908. In the foreseeable future?—Yes, as far as it is foreseeable. Europe does not want so much gold; well then let India have it. This is an opportune time for India to go to a gold standard without disturbing Europe, which does not want much of this gold which if anything is a surplus; well let it come to India.

4909. Finally, on the question of cost, making the assumption, which is made in that memorandum, that the total final cost of the introduction of a full gold standard and a gold currency in India will be something like 1 or 2 crores a year, and adding that to the 3 crores which you have referred to as the possible cost to Government of the reduction of the ration to 1*s.* 4*d.*, I understand it to be your opinion that that total cost of between 4 and 5 crores would be worth paying for the benefits of the two proposals which you make?—It will be a lesser evil than a manipulated gold exchange standard. I am opposed to any manipulation of currency. As the Premier, Mr. Baldwin, said the other day he would not give the management of the currency to any government in the world, and our currency has been so badly managed in the last thirty years that I think we can undergo this cost rather than have this manipulation.

4910. What difference would it make, in your opinion, as regards the elimination of these evils of interference and management to which you refer supposing the currency system adopted in India were to be a perfected exchange standard system, perfected in this manner, that the legal obligation was undertaken to sell either gold for export or foreign currency against internal currency at a fixed rate, and if at the same time the management and control of the note issue, and thus of the currency system of the country, were to be transferred from the Government of India to a central bank? Would such proposals as those, in your opinion, materially eliminate those evils as regards the management and interference which you deprecate?—If a gold exchange standard were made,

if you will excuse my using these words, both knave-proof and fool-proof, there may be something to be said in its favour, if it is not trifled with or made an instrument of exploitation. But otherwise the gold standard is the best. Manipulation of currency in the hands of a government is the most dangerous power that can be given to it, therefore I favour a gold standard; but if it can be made, as I said, both knave-proof and fool-proof so that it cannot be manipulated, there may be something to be said in favour of it, that is all I can say.

4911. One or two minor points before I conclude. I understand you are in favour of the re-issue of the one-rupee note, as a measure, I suppose, for popularisation and increase of the use of notes?—Yes.

4912. And likewise of the transfer of the note issue to the Imperial Bank of India?—Yes.

4913. Also of the transfer of the remittance operations of the Government of India to the Imperial Bank?—Yes.

4914. With the limitation of the remittances to the actual necessities of the Government from period to period. If such a transfer were made, I suppose the question of secrecy, upon which you lay stress, would no longer arise when the transactions are conducted in the ordinary banking manner?—Yes; what I object to and what the market objects to is this secrecy.

4915. Under present conditions?—Under any conditions, because the main supply of money in India is through purchases of sterling by Government or, what is the same thing, the sale of council bills by Government. If that thing is kept secret for thirty days, as it is done now, how could the market know, how could the market judge its requirements? I am opposed to secrecy. There is no reason to keep it secret. If the Government has to remit 30 millions, it remits it in 12 months; it announces it has remitted so much; why should there be any secrecy about it? What is the idea, unless you want to manipulate? Because there is no reason for that secrecy unless Government manipulate exchange? Its business is to get 30 millions to the other side, and why make a secret of the remittances?

4916. The transfer of the remittance operations to the Central Bank would close the door upon any possibility of Government manipulating the exchange market, would it not?—That is so; but even then why should the Imperial Bank keep it secret? There is no reason; I think the world has a right to know how that money is being remitted.

4917. What would be known would be the total Government requirements for the year, which would be apparent from the budget statement, I imagine, and it would be known that those are supplied by the bank to the Government as it were month by month. Is there any further necessity for the publication of that information under such conditions?—The world's trade is carried on with India mainly through means of these remittances. So, how could you keep the thing secret like that from the world? What is the object unless you are manipulating exchange, and what would be the object once you suppose that the exchange is recommended to be fixed by this Commission at a certain rate? What is the advantage to Government? On the other hand it is a disadvantage to the public.

4918. It occurs to me that the publication of the Government's demands upon the bank month by month would convey no useful information to the public at all, because it would not disclose as a matter of fact that the bank had been making these purchases; these purchases would not be earmarked against the Governemnt's requirements at all. All that would be known is that so much is actually taken up by the Government in such and such a month; it might have been purchased at a different period?—If the Imperial Bank kept it secret how are the exchange banks to know whether it is going to buy more of sterling or not? Supposing I am an exchange banker I must know how much the Imperial Bank is going to remit; otherwise how could I know what I am to do? How can I gauge my future action? Of course in the case of a fixed exchange it will only vary between gold points, and it will not be such an important matter; but still it is not a thing that need be kept private; there is no necessity for it. I think the Government have only recently adopted this secrecy policy because they wanted to manipulate exchange; once that manipulation ceases, what is the necessity of keeping it private?

4919. (*Chairman.*) I think that concludes the questions I wanted to ask. They cover most of your recommendations, with the exception of your recommendations as to emergency currency which are set forth in very clear detail. I will now ask you to deal with any supplementary questions which any of my colleagues may want to ask you.

4920. (*Professor Coyajee.*) You have said in paragraph 11 of your memorandum that any change of the ratio from 1*s.* 4*d.* which was the legal ratio for 27 years must upset the relations between debtors and creditors. As regards this, a witness before this Commission has advanced the following argument which I shall put to you for your opinion and criticism: He argues that a great deal is talked about the gross inequity of the proposals to raise the rate of exchange above 1*s.* 4*d.* to the debtors. But the right method of redressing any injustice to the debtors is not to restore the pre-war rate of exchange but the pre-war level of prices, and this, if accomplished, would raise the exchange much higher than 1*s.* 6*d.* What have you to say on that? Could you give us your opinion whether justice to debtors does not require the restoration of the old level of prices rather than the old level of exchange?—Does he live in this world, or does he live in a world apart from the one we live in? If he wants to restore the old level of prices he wants to attempt the impossible; and if he did attempt it, it would mean the most terrible strain on the country, as I have explained in several paragraphs in my statement. There is not, if I may say so, much sense in that criticism, Sir.

4921. But then the argument from equity as regards the exchange loses much of its force?—It does not lose its force at all, except that you want to live in a price level of your own, secluded from the world. Then you might argue like that, not otherwise; the question of exchange immediately comes in.

4922. He then says that the outstanding contracts which were entered into before the present ratio came in cannot be very many. That is another contention?—There must be millions of outstanding mortgages and contracts between debtors and creditors; there are outstanding contracts between Government and the people, and there is always revenue to be paid to the Government, which is a great contract, as it were.

4923. (*Sir Purshotamdas Thakurdas.*) I would like to ask you one question regarding what you have said in paragraph 15. If a return to 1*s.* 4*d.* involves inflation, would you call that what is generally understood by the word "inflation" or would you say that this is stoppage of artificial and unjustified deflation in India?—I would.

4924. Is it likely that that is what was in your mind?—Yes.

4925. (*Sir Reginald Mant.*) You have stated in your memorandum that as gold prices fall the trade balance in favour of India will get less?—Yes.

4926. And you explained in reply to the Chairman, quite correctly, I think, that India will get a smaller price for the produce which she exports and will pay a smaller price for what she imports?—Yes.

4927. And the balance left over will also be smaller; it will be smaller, will it not, in money, but will the purchasing power of that balance be any smaller? Will you not be able to purchase exactly the same amount of commodities with that balance?—With that balance of trade in her favour?

4928. Yes?—Measured in money, you mean, Sir, the balance of trade would be less.

4929. You are perfectly correct in saying that. What I wanted to know was this, although it is less measured in money, will it not be of the same purchasing value because we are assuming a general fall in prices?—May I put it this way, Sir? What would you do with that balance of trade? In the first place, should the Government utilise it to make their remittances? Therefore the balance which you have created by commodities goes apparently to meet that Government remittance. Those commodities at that rate of exchange must be proportionately more. Therefore the people will have to export more in commodities at 1s. 6d. than at 1s. 4d. to meet that Government remittance. That is the first hitch. All the balance of trade does not go into the pockets of the people. How do the people benefit by creating that smaller balance of trade which, measured in money, has a larger buying power?

4930. You mean really that India will suffer from a fall in prices because the burden of her debts will be greater?—Yes, Sir, measured in commodities, it will be greater.

4931. That will equally happen whatever the rate of exchange may be?—If it didn't exercise any influence on prices it would. But at a higher exchange, with lower prices, other things being equal, it must.

4932. The higher exchange would tend to reduce that burden of foreign debt?—It will raise it, Sir. Because the people will have to pay more in produce to meet that foreign debt. Not less, but more.

4933. How will they have to pay more at the higher rate of exchange?—Well, that is not met by money, but by produce. If you lower the value of that produce we must give more produce to meet that debt. Therefore, we are losers. I mean the country is a loser. If to meet that debt at 1s. 4d. you have to export, say, a million bales of cotton, then at the higher exchange you would have to export a million and 125 thousand bales to meet it. In produce it is more. It does not look so in money, but in produce it is more because, other things being equal, you must do it, otherwise that Government remittance cannot be made.

4934. But how will raising the level of exchange reduce the price which you get for your cotton abroad? If you export a million bales, is it?—Say a million bales; we actually export two and a half million bales from Bombay.

4935. By raising the rate of exchange, you would reduce the internal price in India. You would not affect the price which you get for cotton abroad? Why would you have to export more cotton to meet the same amount of sterling obligation?—Well, supposing the price of cotton in Liverpool is 10 pence a pound in 1924 and the exchange is 1s. 4d. In 1925 the price is still 10d. per pound in Liverpool but the exchange is 1s. 6d. Then to get the same money you must export 12 per cent. more cotton.

4936. We are assuming that the price in Liverpool is still 10 pence?—I assume that the price is stable. But even supposing prices went up, then India would not get the advantage of it to the extent of 12 per cent.

4937. But assuming that the price in Liverpool is stable and we sell our cotton in Liverpool, surely we should get the same amount in sterling for it and we should not have to export more cotton to discharge our sterling liability?—How can we do that? Supposing I am a merchant and I want to buy a thousand bales of cotton for Liverpool. The price this year is 10d. at 1s. 4d. exchange. The next year it is 10d. at 1s. 6d. exchange. I go to a merchant and at 1s. 6d. exchange he must give it at 12 per cent. less price in India. Otherwise that transaction will not be put through.

4938. But you said just now that the man would have to export more cotton. We weren't referring to the price he would pay in India?—Well, he must export more cotton to get the same value in money.

4939. To meet the same sterling obligation?—Yes.

4940. I am afraid I cannot see it. Now, you referred in your memorandum and in your answers to the Chairman to the greater drain that would be felt in India by fixing the exchange at 1s. 6d. instead of 1s. 4d. I didn't quite follow the reasons that you gave for that view. I should be glad if you would explain it further?—Well, again, we must assume, Sir, that prices are the same as the outside world prices for all kinds of produce that India exports. As I said, the merchants there, when they do their business, look to their exchange. If I as a merchant get an order from Europe to buy a thousand tons of linseed, I ask my broker: "What is the rate of exchange?" He says: "1s. 4d. this year." Next year I ask him: "What is the rate of exchange?" He says: "1s. 6d." The rate for the linseed being assumed to be the same, I must tell the man who sells linseed: "I will give you 12½ per cent. less for the linseed, otherwise I can't sell it in Europe." The merchant must therefore sell the linseed at 12½ per cent. less, or it will not be exported.

4941. But you say that the higher the ratio the greater the drain that the country has to meet?—Which paragraph is that?

4942. The end of paragraph 10?—Well, Sir, then it refers to that remittance of 100 crores per annum. You have got to remit commodities of the value of 100 crores or if measured in pounds, say 70 million pounds, which is the foreign indebtedness of India measured in gold. You must send it out of the country in the shape of commodities. Or you must export gold, but that is not the question. Well, then, other things being equal, to get that 70 million pounds abroad I must sell a larger quantity of produce at 1s. 6d. exchange than I would have to sell at 1s. 4d. exchange. You will have to sell a larger quantity abroad—if I have to pay you 70 million pounds in London and I can only do it by exporting my produce. I go to a merchant and say: I have got no money to give, but I have got these bales of cotton. The merchant will say: All right, I will give £72 in London if you give me five bales of cotton if the exchange is at 1s. 4d. If the exchange is at 1s. 6d. he will say six bales of cotton.

4943. Are you referring to an internal transaction in the country?—No, Sir, the reference is to the foreign debt of India. This is what I mean, that to meet the foreign debt of India I must export more produce to meet that foreign debt at 1s. 6d. than at 1s. 4d.

4944. Although we are assuming that the foreign price will be exactly the same?—Yes.

4945. I am afraid we come back to the same point. I am unable to follow you?—I am sorry, but the paragraph refers to the foreign debt of India, and at a higher rate of exchange you would have to export more produce to meet that debt, other things being equal.

4946. That is your view. We will leave it at that?—Yes.

4947. Then in discussing the rates of interest prevailing in India you pointed out correctly, I think, that the difference between the rates prevailing in India and abroad is largely due to the fluctuations of exchange and uncertainty as to the future course of exchange. You said, I think, that if exchange was stabilised the rates would tend to approximate?—Particularly to the London money rate.
